THE EIGHTY-SECOND AND LAST INDEX TO "THE NATION" (1865-1906)
PREPARED BY THE HAND OF W. P. G.

The Nation.

NEW YORK, THURSDAY, JANUARY 4, 1906.

The Week.

A member of the Senate Committee on Foreign Relations rather cruelly exposes the way in which President Roosevelt's innocence may be taken advantage of by the wily Dominicans. This Senator shows why the President's course, which he thought so surely preventive of a revolution in Santo Domingo, was in reality provocative of one. Because, argued Mr. Roosevelt in the goodness of his heart, Dominican revolutionists "usually have as their real aim the obtaining possession of the custom-houses," and because we now have Americans collecting the revenue, therefore there will be no more revolutions. It was a beautiful Q. E. D. But along comes the Senator to pick flaws in the logic. He remarks that it was always the money, not the custom-houses, of which Dominican revolutionists wished to obtain possession. Consequently, when they were informed by President Roosevelt that a million dollars or so was lying in bank in New York, "for equitable division, in case the treaty shall be ratified, among the various creditors," their fingers naturally itched to get hold of it. The method was obviously to seize the Government, tear up the treaty, terminate President Roosevelt's "arrangement," and call for the delivery of that $1,000,000. The money undoubtedly belongs to the Dominican Government; and if Jimenez or Cáceres or any other enterprising gentleman turns up as the *de facto* Government, he will be entitled to demand it. It appears, therefore, that what President Roosevelt fondly imagined would be a prize for peace, was really a premium for revolution.

We can hardly credit the report that James F. Smith, or Gen. "Jim" Smith, as he is familiarly known, is to succeed Luke E. Wright as Governor-General of the Philippines. That Mr. Wright would not return to Manila has been the accepted belief in Washington, notwithstanding repeated official denials. The chief objection to him seems to be his Southern point of view in his treatment of the Filipinos, in accordance with which he has kept himself aloof from social relations with them. Gen. Smith, who is a prominent Catholic, is about forty-six years of age, and first went to the Philippines as colonel of the First California Volunteers, giving up his law practice to do so. In April, 1899, he was made a brigadier-general of volunteers, and as such he was Governor of Negros. In 1900 he served as collector of customs at Manila, and a year later became associate justice of the insular Supreme Court. On October 13, 1902, he was appointed a member of the Philippine Commission, succeeding Prof. Bernard Moses. In the three years he has held this position he has been largely engaged in the task of forcing the English language upon the natives, as head of the Department of Public Instruction. He has also had under him the Bureau of Public Printing, the Bureau of Archives, the Bureau of Census, etc. We cannot feel, however, that Gen. Smith is of the proper calibre to warrant his being made head of the Government. It was a step downward from Taft to Wright, as a result of which there is a wider cleft between Filipinos and Americans than ever before, as Mr. Taft discovered last summer. It would be a step downward from Wright to Smith. The Governor-General ought, for one thing, to be widely known to the people of the United States and to possess their confidence.

We sympathize with the bronze founders who have petitioned Secretary Taft to see to it that all statuary commissioned by the Government be cast in American shops. The immediate grievance concerns MacMonnies's "Sherman," which is about to be put in bronze by the pauper founders of Paris. MacMonnies, the complainants allege, has done this thing for no better reason than that bronze casting is cheaper in Europe than America. We are unwilling to believe that he can have been moved by so unpatriotic a motive. He must know that the formula "a cheap coat makes a cheap man" is as true of civil-war generals in bronze as in woollens. One would fain believe that simple convenience and acquaintance count for something. Mr. MacMonnies has lived for years in Paris, most of his sculpture has been both modelled and cast there, and it is possible that his reasons for abiding by the artisans he knows are not wholly anti-American. Secretary Taft's petitioners point out that American casting is surpassed by none, which is the fact, and add as an interesting detail that they are making a bronze McClellan for Mr. Paul Bartlett. Now Mr. Bartlett, like his colleague, MacMonnies, is an expatriated American, and has made and manufactured the greater part of his sculpture in Paris. Still, the transfer of his McClellan to an American firm has not been the occasion of indignation at Paris. In short, it is a cosmopolitan age, and the fact may yet be perceived by the outraged brass founders of America, most of whom are of French, and very recent, derivation.

One result of the withholding of passes by the railroads entering the city of Washington is that the Congressional mileage this year ceases to be a mere generous addition to the member's salary, and must be regarded, for the first time in many years, as a sum actually to be spent in travelling home and back. Baltimore, for instance, is an hour's ride from Washington. The Baltimore Congressmen receive $16.80 each as mileage. Those from the State of Washington have about a hundred times as much, or $1,412.40, while the Hawaiian delegate heads the list with $2,314.30. Debates on the mileage question have brought out rather amusing differences of opinion as to whether travelling expenses, when the 20-cent-a-mile rate was fixed, were lower or higher than at present. But that this amount will enable a member to pay fare, especially at the season of holiday rates, is hardly to be disputed. In fact, the injustice of the present system is that it enables the member from a Western district who actually goes home and pays his way—let alone the one who does not—to save hundreds of dollars more out of his mileage than the Easterner. There is much to be said in favor of the plan of paying legislative expenses of travel in the same way as if the men were on departmental business.

Such a retirement as that of the Chief Justice of the United States Court of Claims at the end of last year ought not to pass unnoticed. Judge Nott had been a member of that Court for nearly forty-one years. In the class of important questions coming before it he made for himself a high judicial reputation. All his life an eager student of government, he retires now, not on account of infirmities of age, but mainly to devote his remaining years to further constitutional studies. His career has been honorable and serviceable to the country, and he will take with him from the bench the respect and good wishes of all who have been in any way associated with him.

It is a pity that bosses politically executed by their fellow-citizens should die such a lingering death. Cox of Cincinnati received his death-stroke early in November, but actual dissolution was not to occur until January 1, and meanwhile he retained strength for more mischief. He has just put through the City Council, by a vote of 25 to 3, an ordinance giving a franchise without

compensation for supplying natural gas. For the rejection of a competing offer of 30-cent gas, as against the 75-cent product of the favored company, and the similar rejection of a half-million-dollar offer for the same privilege, it is hard to find a closer parallel than Mayor Ashbridge's famous act of signing away Philadelphia's street railway privileges for nothing, when a $2,000,000 offer was before him. "Remember Philadelphia" was the rallying cry against the eleventh-hour ordinance in Cincinnati, but it was unsuccessful. One thing to be said about such utterly barefaced jobs as this is that they indicate either sublime confidence of the ring in its ability to keep in power, or else confession of defeat for a good while to come. We trust that in Cincinnati the former alternative may be dismissed as impossible.

It is not alone Mayor McClellan's words on taking office which indicate that he has turned over a new leaf, and that upon it the name Tammany is not written in capital letters. There are also acts which speak louder than words. Among them, the Mayor's appointments are most significant. Good or bad, as the event may prove them, they are at least his own. Murphy makes a ghastly pretence of being satisfied with them—that is one of the necessary humiliations of a defeated boss—but is not equal to asserting that he suggested them. Mayor McClellan has set up for himself. A sure sign of it is the fact that only two Tammany district leaders were present at his New Year's reception. The joyous claim of ownership which the Wigwam made, and with so good a show of right, two years ago, it no longer puts forward. Mayor McClellan's declaration of independence marks him as the latest if not most distinguished convert from the doctrine that municipal affairs are best administered when administered in the interest of a party. If he has not come over fully and openly to the belief in absolutely non-partisan administration of cities, he is, at any rate, worlds away from his position of two years ago. Then his talk was all of the necessity of parties in municipal government. He was a Democrat (meaning a Tammany Democrat) and he served notice that he should make his Administration Democratic—that is, Tammany. But the hard school of experience has taught him the folly of that. His purely partisan appointees have been the ones which brought him most embarrassment and discredit; and now he announces but one standard, that of efficient service of the city. And he warns his new heads of department that he will not hesitate to remove any of them whom he finds coming short in the strict performance of their duty to the city.

Mr. McClellan's rather melancholy putting away of the hope of political advancement—the Mayoralty, he declares, is "the last public office which, in all human probability, I shall ever fill"—he seemed to think an inevitable concomitant of his pledge to give the city "a clean, efficient, and honest government." Yet one does not necessarily imply the other. What the Mayor has in mind, doubtless, is the shattering of his old theory, and the dissipation of his old hopes, regarding the road to high political station. Instead of being comfortably assisted by Murphy into the Governor's chair, and thence to the White House, he suddenly discovers that Murphy has very nearly pulled him down in his own ruin. Already there are rumors of a new Tammany combination for the double purpose of ousting Murphy and attacking McClellan, rendering the latter impotent, if possible, in the Board of Estimate and Apportionment.

"The insurance companies," said Louis F. Payn last week, "are cowards," thus compressing into five words one of the most important facts which the legislative committee has uncovered in its months of investigation. The huge insurance companies, the richest and in many ways the most powerful corporations in America, have been the victims of organized blackmail. Bullied by this highwayman or that, they have paid out hundreds of thousands of dollars as meekly and uncomplainingly as private people with more money than brains (our Amalgamated Association of Easy Marks) have subscribed $1,500 or more each to that ridiculous book, 'Fads and Fancies.' For the man who hands out one or two thousand dollars rather than have the family skeleton exposed, one feels not pure contempt, but a certain pity also. An individual who wishes to avoid trouble and who has no defence except costly and unpleasant litigation, has a pretext, if not an excuse, for his weakness. But the insurance companies can plead neither feebleness nor ignorance. Their resources have been enormous; they have retained the ablest lawyers. Yet—to quote Mr. Payn again—"all these great corporations are afraid not only of strike legislation, but of some of these insurance departments. There are also agents and actuaries who strike them." It was nominally in order to guard against these so-called strikes that the New York Life, the Equitable, and the Mutual formed an offensive and defensive alliance, and created an elaborate machine for the corruption of legislatures and State officials, and for the manufacture of public sentiment by newspaper articles.

The full plan of combination of the Belmont and Ryan traction interests contemplates turning the present $30,000,000 Interborough stock into $70,000,000 bonds, with a "bonus" of $31,500,000 in new stock; converting the $52,000,000 outstanding Metropolitan Street Railway stock into $78,000,000 new stock, and buying up the stock of the old "holding company" with stock of a new one. This is, clearly enough, a stock-watering plan on the scale of 1901. We are not likely to hear again very soon the assertion which the Subway's financial managers have been wont to make with pride, that here at least is a railway enterprise in which capital inflation has played no part. The new plan, if carried out successfully, will change all that, and will change it on much the same lines as Jay Gould selected, a generation ago, for watering the stock of the Elevated Railway. The "traction-merger" plan is, in fact, worthy of careful study as a financial expedient which unites the particular vices of the so-called "new finance" with the characteristic vices of the old. It may be further remarked, for the information of the curious, that the proposal involves confession that the celebrated "Metropolitan deal" of February, 1902, has been a failure from every point of view. When the chairman at the meeting of Metropolitan Street Railway shareholders had ordered those helpless investors to "vote for the motion first and discuss it afterward," and when the lease of the system to the new company, on a 7 per cent. guaranteed dividend, had been decreed, we raised the question who was to guarantee the guarantor. The answer which most people now will make is that the guarantee was in most respects worthless. The 7 per cent. dividend has not been earned; the guarantor is sick of his guarantee; therefore it is now proposed that, when the Street Railway shareholders "come into the new deal," they shall consent to the scaling down of their dividend to 5 per cent. This gentle suggestion is accompanied by a proffer of $26,000,000 bonus in the common stock of the new "holding company," to the manufacture of which security the plan is chiefly devoted. This is merely the breaking of the 999-year lease of 1902 because its continuance had become inconvenient to the lessee.

If a part of the water put into the traction merger was placed there in the belief that the city will be helpless before the plans of the promoters, they must already be undeceived. The Rapid Transit Commission is awake to the situation. President Orr makes it plain that he and his colleagues do not propose to be, in the matter of new subways, at the mercy of the Belmont-Ryan combination. If the latter's bid for the subway extensions is not on terms ad-

vantageous for the public, some way will be found to introduce competition, or else the city will build for itself. It is late in the day for any traction syndicate, however over-capitalized, to ask New York insolently, "What are you going to do about it?" The power to tax and to regulate remains, and it should freely be made use of in order to protect the public from extortion. And if the Belmont-Ryan combination comes forward *in forma pauperis* to plead that it cannot build the new subways on proper terms, since it would then not be able to pay its fixed charges, a fitting reply by the Rapid Transit Commission would be: "Squeeze the water out of your bonds and then you can."

To raise $100,000 in America for the support of higher classical studies in Rome is probably harder than to raise a million for some project of commercial or industrial education at home. Yet the good news that this has been done was announced last week from Ithaca. It has taken five years of persistent effort to do it, and now the American School of Classical Studies in Rome passes from the time of trial to an era of assured support. It has been one of the only two schools of higher scientific learning sustained by American generosity on the Continent of Europe; but it has had to struggle hard, first for its life, and then for due recognition. All the time it has gone quietly about its work, living frugally, husbanding its energies, and winning year by year the increasing respect of the Italian Government, the Vatican, and the German, French, and British Schools. It has produced a small group of trained investigators and museum experts. It has sent back to our schools and colleges nearly one hundred and fifty instructors, newly vivified and alert from contact with the quickening influences of the greatest teacher of ancient history —the Eternal City. It has won its way for the best of reasons—it has proved its right to live. And the success already won by economy and well-directed hard work should lead to greater things. Its endowment should be enlarged and a permanent home provided for it.

With Campbell-Bannerman's flat statement that Irish Home Rule does not mean Irish independence, and the Duke of Devonshire's advice that Liberal Unionists should vote for Liberal candidates rather than for Chamberlainites, the separatist skeleton has been quietly put back into its closet, and the general election will be fought on the immediate issue of protection and free trade. As if to emphasize this fact, Mr. Chamberlain's election manifesto distinctly demands a tariff which will "secure the largest amount of employment at fair wages for our people." Yet with a consciousness that fiscal reform is a little heavy to float alone, he buoys it up with abuse of a "Home-Rule-Little-Englander Government." But, for electoral purposes, the Prime Minister appears to have plain sailing. Mr. Balfour has been as unsuccessful in interpolating the Home-Rule issue as he has been in suppressing that of Imperial reciprocity. With the issues clearly defined for the battle before the constituencies, the Liberals may remain well content. In case of their success, there will, of course, remain the Irish members to deal with. Home Rule is, after all, only adjourned, and Mr. Redmond's followers may not like Campbell-Bannerman's and Mr. Bryce's recipe for "devolution of power" much better than Balfour's and Mr. Wyndham's.

John Burns, the first Labor member of Parliament to become a Cabinet Minister, displayed good sense in his first official speech, on December 20, on the subject of the unemployed. For loafers and drunkards, he declared, he had no sympathy. In this he is in accord with a clergyman, the Rev. Mr. Watts-Ditchfield, whose life is devoted to the service of the London poor, and who holds that the two most troublesome classes are the worthless vagabonds, not far removed from criminality, and those without any trade, and therefore so frequently without occupation. He, with Gen. Booth of the Salvation Army, favors colonization for the latter, though he would have them settled in the sparsely populated parts of Ireland, rather than in Australia. For that matter, Australia does not appear to want these superfluous and helpless Englishmen. Gen. Booth has admitted that his plan of colonizing them in the interior of Australia is opposed by the authorities. The latter argue with much force that such feeble and feckless settlers, even if given 200 acres of land, would not be able to support themselves, and might be expected soon to become a public charge.

In France also the question of the unemployed is serious. The latest statistics show that there are in that country twenty thousand men who are without work simply because they do not wish to work. During the winter many of them are glad to drift into the prisons, where they find it more comfortable than to wander through streets and lanes by day, and to sleep under the shelter of bridges and outhouses by night. But during the warmer months their roof is the sky, and they feed themselves by begging in the smaller towns and hamlets. Unfortunately, it is not upon the rich that the burden of this vagabond class weighs most heavily, for they are difficult of access and enjoy police protection. The industrious laborer, the small farmer and tradesman, the unprotected women and children, have to support this shiftless, wandering army and endure its importunity and half-veiled threats. In England under the Tudors the man who gave to a beggar was fined, and the recipient of the gift was punished. It seems to have been perceived that the vagabond is potentially a criminal, and that it is usually his cowardice, not his conscience, which deters the street beggar and the tramp from robbery and violence. Certainly, as John Burns holds, no plan of dealing with the unemployed will commend itself which does not rule out these wastrels and semi-criminal idlers, or deal sharply with them.

With King Edward and President Loubet known to be delighted with the outlook for peace, rumor-mongers are hard put to it to get up the war scare so essential to all "forecasts of the year" of the time-honored kind. Berlin, too, is insistent that there are no war-clouds on the horizon. But even this assurance is not enough for the London *Times*—now one of the most sensational journals—and its anonymous "military correspondents." They can get you up a war-scare at any time on any order, having the finest possible nose for fighting on the Indian frontier. If you show them the folly of that, they are persuaded that the Emperor of Germany means to steal the Baltic provinces from his brother of Russia. With this officially denied, there is always the opportunity to hint that the Moroccan difficulty has just reached a "very critical stage" known only to insiders. Finally, when this bubble is exploded, there is ever the Far East to turn to. As matters stand now, the would-be manufacturers of war seem to be trying to get up a fight between France and Germany which shall be labelled, "Made in England." As such it need cause no worry.

No one deplores the lack of method in the revolutionary madness of Russia more than the recognized leaders of the Liberal movement. Peter von Struve protests, in a recent number of the Moscow *Russkiya Vyedomosti*, against the dictatorship of the "revolutionary proletariat," no less fatal, in his opinion, to the cause of freedom than the dictatorship of the "Black Hundred." He warns laboring men and the peasantry against the folly of being drawn into social anarchy, and condemns in the strongest terms the current strike. He contrasts its excesses with the well-considered aims of the strike of last October, and remarks: "Let us beware of making an idol and a fetish of so dangerous a remedy. What is to-day a glorious strike, may to-morrow be destructive and criminal."

A TREATY WITH CHAOS.

Newspaper readers must have rubbed their eyes at the dispatches telling of another revolution in Santo Domingo. Only a month before they had been assured on the highest authority—that of President Roosevelt—that such a thing was impossible. In his last message to Congress, the President explained that the wise "temporary arrangement" which he made after the Senate had refused to ratify his treaty with Santo Domingo, had "completely discouraged all revolutionary movement" in the island. His firm but kind intervention had enabled "the poor harassed people of Santo Domingo once more to turn their attention to industry, and to be free from the curse of interminable revolutionary disturbance." "Stability and order and all the benefits of peace are at last coming to Santo Domingo." True, Mr. Roosevelt contemplated a distant possibility of "chaos." That was to be feared, he informed Congress, only in case the "arrangement" was allowed to terminate and the treaty to fail. But chaos has arrived ahead of time.

To go back over the President's course in all this Dominican adventure is to discover great vacillation on his part. He does not appear to have been clear in his own mind as to either the grounds of his contemplated action, its method, or its scope. First came that extraordinary agreement of January 20, which has not yet been fully explained, but which was, in effect, a treaty to be put into force without ratification by the Senate. That the President's agents, under his instructions, so regarded the remarkable document is certain; the *Tribune's* inspired Washington correspondent announced that this was also the Administration view. But strong opposition arose, and a new treaty was framed and submitted to the Senate on February 15. This was the treaty of which Secretary Hay wrote, at about that time, to a friend that he should not be inconsolable if the Senate killed it, though the President assured the Senate of its vast importance, and dwelt on the "urgent need of prompt action." In a special message on March 6, he renewed his demand for "action at an early moment." But an unfeeling Senate turned a deaf ear. Things dragged along under the "arrangement," and, meanwhile, the treaty was patched up again, and again laid before the Senate.

What was the main reason given by Mr. Roosevelt for the action he proposed to take? The Monroe Doctrine. That was thrust to the front both by himself and by his apologists. It was "the late Colonel Monroe" who was compelling us to readjust the finances of the Dominican republic, or of any other bankrupt country in this hemisphere. "Those who profit by the Monroe Doctrine," said the President, "must accept certain responsibilities along with the rights which it confers"; and the responsibility for the foreign debts of Santo Domingo was deduced with irrefragable logic. So, too, Prof. J. B. Moore, who has so often been called in by the Administration as a convenient expounder of its international law, explained in the *Review of Reviews* that the Dominican proposal was simply "the Roosevelt corollary from the Monroe Doctrine." But there were Monroe Doctors in the Senate, too, and they would not admit the "corollary" at all; in order to placate them, its only begetter has now thrown it out of the window, Professor Moore and all. Says President Roosevelt in his latest message: "It is not of the slightest consequence whether we grant the aid needed by Santo Domingo as an incident to the wise development of the Monroe Doctrine, or because we regard the case as standing wholly by itself, and to be treated as such and not on general principles or with any reference to the Monroe Doctrine."

In that last sentence is indicated a fatal weakness of many of President Roosevelt's proceedings. "Not on general principles." A friend and even admirer of Mr. Roosevelt's has said that his mind seems incapable of grasping a general principle. He is strong on specific instances, but seldom sees their logical connection, and is indignant if told that given action in a given case will compel him to act similarly in another one just like it. It is the thing he immediately wants to do that fills his mind; remoter consequences, the question of applying like measures to like circumstances, the great political truth that when you say A you must also say B—all these things he sheds impatiently. He will not admit, we see, that he is laying down a "general principle" in his plans for Santo Domingo; another republic in distress that might come along and appeal for aid on exactly the same basis, the President would feel at liberty to send away with soundly boxed ears.

It is unfortunately true, however, that statesmanship cannot get along without general principles. The distinction is at least as old as Aristotle between what he called the "emotional" ruler, who puts his will or whim in place of statute, and the public man who governs his conduct by general laws. In the mortifying muddle into which the President has fallen in Santo Domingo we see what comes of putting personal wishes in the place of hard facts. Mr. Roosevelt wished to think of President Morales as a strong "ruler," with the people of his country behind him, and consequently so described him; whereas the slightest study of recent Dominican history would have shown of what type of desperate adventurer he was, and how wildly imprudent it would be to tie to him. In trying amiably to prevent "chaos," Mr. Roosevelt has, in fact, made a treaty with it. It is doubtless the dawning of this fact upon Washington which now makes even "Administration circles" confess that the chances of the treaty's ratification are almost nil. As the terrible hurricane in St. Thomas in 1870 had much to do with the Senate's rejection of President Grant's treaty to annex that island, so, it seems certain, will the news of a revolution in Santo Domingo "against the Government and the Dominican-American fiscal convention," as the dispatches report it, give President Roosevelt's Santo Domingo treaty its quietus.

REFORM BETWEEN FRIENDS.

Secretary Shaw comes gallantly to the rescue of his friend, John R. Walsh, who caused three Chicago banks to become insolvent. There was nothing "criminal," he declares, about Walsh's methods. To be sure, "that part of the banking law which prohibits the loaning of more than 10 per cent. of the capitalization to one man may have been violated"; but even that is not criminal, and Walsh "did no more than many other bankers are doing all the time." Besides, "the depositors will get every dollar," so what possible ground of complaint is there? The rumor of prosecution by the Government, Mr. Shaw added, is "nothing but talk."

It is more than "talk," however, when the chief minister of finance thus poohpoohs serious financial irregularities. At a time when there is so much suspicion and distrust in people's minds, following the financial scandals that have leaped to light, the Secretary of the Treasury should be the last man even to appear to lower the standards. He should lead all the rest in insisting upon absolute probity, faithful compliance with every provision of the law, maintaining sacredly each safeguard. The defence, "they all do it," ill becomes a man in a position of his high responsibility; and as for the excuse that no money was lost to innocent parties by the improprieties and illegalities, that is something which Mr. Shaw had better leave to George W. Perkins. For our part, we find the Secretary's condonation of Walsh simply shocking—most shocking of all, perhaps, from the fact that Mr. Shaw appears to think it the most innocent thing in the world. Walsh is his personal friend. It is in the guise of friendship that Mr. Shaw comes forward to make light of the charges against the Chicago banker and promoter.

In this respect, it must be confessed, he is following an exalted precedent. It is characteristic of this Administration that it can see nothing wrong in any of its friends. Very kind to their virtues, it is stone blind to their faults. What would be outrageous or unlawful in an

ordinary citizen, is, at the worst, mistaken zeal in the case of a friend of the Administration. Washington has, in fact, seen a revival of the political classification of London, more than a century ago. Men fall into one of two groups—"Enemies of the Administration," or "Friends of the Administration"; and the latter meet the theological definition, *non possunt peccare*. The theory is this, and it is so firmly held by the President that it is no wonder his Secretaries take it up: "We are conscious of only the purest motives; reform is our daily bread; we think of nothing but the public good. Our virtues are, in short, so miraculous that they necessarily impart something of their supernal quality to our friends. Hence any appearance of unfitness or wrongdoing on their part is deceptive. Any man who brings an accusation against them is either misinformed or malicious."

We were used in Grant's day to seeing the President "stand by" his personal friends when "under fire." Nowadays, however, the ones who are under fire are those who dare to insinuate a doubt against the President's friends. The Presidential batteries open with the fury which we still remember in the case of Paul Morton. Mr. Roosevelt's indignation burned hot at the supposition that the crime of railroad rebating could any longer be a crime when committed by a friend of his. People hastily call this a glaring inconsistency; but it really shows that the President is so dead in earnest about himself and his work, so convinced that all his acts are unimpeachable and his friends flawless, that he simply cannot see what others see. The wicked laugh, but the President perceives no joke whatever.

The publication of the report of the Isthmian Canal Commission serves to demonstrate how Mr. Roosevelt's mind works in this matter. First, we have his letter of April 1 (not taken at the time for an All Fools' Day jest), reorganizing the Commission, and describing the high technical requirements of the appointees. Then we have his speech of May 10, at Chicago, telling the people how he had asked Congress for power to remodel the Commission, and how, when it did not do so, "I remodelled it anyhow, ... and made up my mind to put the best man I could in any given position." Following all this, we have had President Roosevelt's nomination as Canal Commissioner of a man whose warmest champions do not pretend that he has any special qualification for that office. But Mr. Bishop is a personal friend of the President, and that is sufficient to make him fit for any position within Mr. Roosevelt's gift.

If any President but Mr. Roosevelt had tried to foist a crony upon the Commission, all would have thought it a job. People would have said that Jackson or Grant or McKinley never made a more flagrant misuse of public funds to take care of a friend. They would have pointed out that Mr. Bishop's first appointment as "agent of publicity" at $10,000 a year had proved indefensible, and that then the President, in his "anyhow" spirit, had set about making him a "place" at the same salary, fitness or no fitness. But this would be to do the President wrong—to overlook his profound conviction that any friend of his is, *ipso facto*, capable of adorning any position. The long line of Rough Riders and "old guides" whom he has appointed to office does not prove favoritism, but only his firm determination, as he says, to get the best man. Only, with Secretary Shaw, he regards best man as synonymous with friend. It all depends upon the point of view. If President Cleveland had been caught in such an abuse of patronage as the Bishop nomination, Mr. Roosevelt, as stern insister upon Roman virtue in a Democratic Executive, would have made the heavens ring. But Mr. Cleveland had not the great administrative gift of feeling in his heart that he was impeccable and his friends necessarily beyond criticism.

THE PHILIPPINE RAILWAYS.

Governor-General Wright announced on Christmas day that if the second attempt to secure bids on the Philippine railroads should prove unsuccessful, at least a part of the proposed system, "one or more of the important lines," would be built by the Government itself. Following the rejection a fortnight ago of all the bids thus far received, this announcement assumes not a little importance. It adds a new element to the confusion of the existing Philippine situation. There are now in the archipelago about 120 miles of railway, extending from Manila to Dagupan. The Philippine Commission, desirous of developing the economic resources of the country as rapidly as possible, has projected a complete system of railways, aggregating about a thousand miles and furnishing an outlet for the products of the most important regions. The Manila-Dagupan line was built by English capital under a guarantee by the Spanish Government of an 8 per cent. return on the investment. From Congress last year was secured the right of our commission to guarantee 4 per cent. return for thirty years on bona-fide capital invested in the new lines to be built. It is under this law, the Cooper-Lodge act, that the work of securing bidders is proceeding.

The situation at present may be aptly compared to that which exists with reference to the Subways in this city. The existing line has been turned over by its builders to American interests, which themselves put in bids on additional lines still to be constructed, so as to form one system. The only rival offer came from a newly formed American company, which would, if successful, operate the new lines only. The interest of the Commission, meanwhile, lies not only in securing as favorable terms as possible, but in getting the entire system constructed by some one. Secretary Taft stated before the House Committee that of the thousand miles of projected roads, perhaps 30 or 40 per cent. might be expected to make a profit within the near future. The others are expected to be unprofitable for a considerable period to come; those which will not pay are those which it is most important to construct in the interest of the islands; and the line probably most costly—from Manila through the Caravello Pass to Aparri on the Cagayan River—is, according to Mr. Taft, the most expensive of all. While the terms of the rejected bids have not been made public, it is a fair supposition that the bidder controlling the existing road would make the most favorable offers on lines naturally tributary to that road, while the opposing interest would endeavor to secure the lines which could be operated to advantage independently.

Failing to get satisfactory estimates, Secretary Taft has now liberalized the terms, and is making, very properly, a special effort to secure bidders who will waive the guarantee of interest. The new terms provide:

> "Whenever in any case a bidder proposes to build the whole or any of the routes specified in the original invitation without guarantee, he may make his bid deviate in any respect from the specified limitations set forth in the original invitation, provided his terms are such as may be granted by the Philippine Government in view of the provisions of the acts of Congress approved July 1, 1902, and February 6, 1905, as set forth in the original invitation."

A great deal was said in Congress about the impossibility of securing American capital to build the lines without Government aid, but that there should be any hitch in getting the work done with such inducements does not seem to have occurred to any of the members who took part in the debate. Taft himself, when civil governor, had said:

> "It should be noted that if American capital declines to come, English, Belgian, and other foreign capital is merely awaiting the franchises which are requested for railroad and other constructive enterprises; and that it will be the duty of the Commission to grant such franchises for the benefit of the Islands."

The argument that the execution as well as the conception of these important aids to the development of our wards ought to be in exclusively American hands, is one that falls in with the general idea of our Providential function in the Orient. We have no doubt there could be found defenders of even the bald proposition that it is better to pay an American for the work than to

let a foreigner do it for nothing. At the same time, the logic of the initial policies might lead us to some dangerous conclusions. Every concession in the islands which is predicated on the express or implied promise of the United States to retain ownership indefinitely is another obstacle in the way of free and enlightened action in the future. The Philippine railroads had better not be built at all if their construction commits us to permanent occupation. This is certainly a danger in our whole policy of material development. What effect did Secretary Taft's "injudicious" mention of Philippine independence have, for instance, on prospective bidders for concessions in the Philippines last year? The present guarantee of railroad profits would be made nominally by the insular authorities; but how far is the Federal Government's credit virtually to be pledged? The case has been stated very frankly. For example, Mr. Cooper, chairman of the Committee on Insular Affairs, said in closing the debate in the House:

"Mr. Speaker, American capital refuses to go into railroad building in those islands because of the risk—a risk in part, at least, attributable to the threats constantly made by gentlemen upon that side of the Chamber and by their political associates throughout the United States, that, give them the power, they will turn those Islands over to a native Filipino Government."

The argument was in effect that we must build Philippine railroads, whatever the cost and however far-reaching the consequences. If the present efforts result in getting the desired construction without creating too powerful vested interests naturally adverse to an ultimate separation, then the pen with which President Roosevelt signed the important bill, and which was destined—we do not know if it has got there yet—for a glass case in the Philippine Museum, may be a real object of inspiration.

FREEDOM OF OPINION IN THE SOUTH.

The late Chancellor Hill of the University of Georgia was a representative of the new school of thought in the South, and his death is a loss to the progressive men of that section. A Georgian by birth and lifelong residence, he was as loyal and as devoted to his State as any dweller in Dixie. But he was never one who believed that because a thing or an idea was Southern, it was *ipso facto* right; or that because a custom or a habit of mind commended itself to Southerners, it was therefore sacrosanct. A man of solid learning and sound principle, he naturally thought for himself, and it did not terrify him or silence him if by accident his notions went counter to certain accepted views of the community in which he happened to live.

It was this kind of courage which led him to head the Prohibition State ticket in one of its "forlorn-hope" campaigns; as it doubtless had something to do with his suddenly being called from a lawyer's office to become the head of his alma mater, without any previous teaching experience. Once there, he did not let his presidency padlock his lips or blind him to the truth that free speech is nowhere more necessary than within academic walls. It is related of him that when he heard, two years ago, that the trustees of Trinity College, North Carolina, had sustained the right of Prof. John Spencer Bassett to express himself in print in accordance with the dictates of conscience, Chancellor Hill called his students together and read them the news, declaring it a memorable event in Southern collegiate history. This it was in truth, since it marked the passing of the day when college professors could be driven from their chairs—as Prof. Andrew Sledd had been the year before—for printing opinions distasteful to a majority of their fellow-citizens.

Chancellor Hill was not content with thus putting himself on record. When, in February last, President Alderman of the University of Virginia was roughly assailed and dubbed a traitor by Senator Bailey for declaring that the South's political leaders of to-day were inferior to the Clays and Calhouns of long ago, Mr. Hill wrote out his views in the form of a plea for tolerance, and published it in the Atlanta *Constitution*. He dared to ask whether there really was freedom of opinion in the South; whether every man who "thought above a whisper" must do so "at the peril of his reputation, or his influence, or at the deadlier risk of having an injury inflicted upon the institution or cause he represents." In Mr. Hill's opinion, President Alderman went too far; to him it was wonderful that the South had so many good men in political life when one considered how unfriendly the situation is to the development of strong leaders—that "deadly paralysis of intellect, caused by the enforced unanimity of thought within the lines of one party." Senator Bailey's conduct gave him the text, he declared, for a "warning against that worst evil in our intellectual, social and political and religious life—the illiberality that is ready to inflict the injury of rebuke and ostracism as a penalty for difference of opinion." And, he added: "We all know whence this situation comes. It is one of the entailed curses of slavery," resulting from a unanimous Southern "defence of slavery after the world at large and the thought of the age had entered up judgment of condemnation against it."

Had these words come from the pen of a Northern editor, many others besides Senator Bailey would have wrathfully denounced it. In a Southerner, they implied great courage, as all understand who know what Mr. Hill described as the South's "morbid self-consciousness," its "touch-me-not sensitiveness"—a fundamental defect. It is this absolute domination of a narrow public opinion which is to-day the intellectual undoing of the South. Save at Washington and Lee, at Vanderbilt, at Sewanee, at Trinity, and one or two other colleges, it would stifle freedom of thought and of utterance in the institutions of learning, and drive away men of literary gifts and learning. Before it the press cringes and cowers, when it does not bow down for the sake of gain. Politicians fatten by harping upon it, cheat the people into electing them by basely playing on their prejudices, and predict impossible disaster if there be any break in that paralyzing unanimity of thought which Mr. Hill deplored so manfully. In many of its aspects history is repeating itself: the Southern woman who should dare to-day to teach negroes in the far South, would be as socially dead as was Mrs. Margaret Douglass after her month's imprisonment in Norfolk in January, 1854, for daring to teach free negro children, she being a Southern white woman of good standing.

But there is one difference—a most encouraging and happy one. Where no one could live in the South before 1861 and betray a difference of opinion as to the divine inspiration of slavery, there are more and more men like Walter B. Hill who are speaking out against an abridgment of that liberty of thought and speech which Mr. Hill defined as "the indispensable requisite for the ascertainment of truth." More and more colleges are coming to search for truth in the scientific spirit which knows no metes of section or of nation, or bounds of creed or shibboleth. The same Professor Sledd who was driven from Emory College in 1902 for his *Atlantic Monthly* article, was chosen president of the Florida State University in 1905. If the editor of the *World's Work*, himself a Southerner, is to be believed, the people are more and more beginning to look behind the bogies of the politicians; Mr. Roosevelt's trip South having opened the eyes of thousands who were misled into thinking him an unspeakable villain two years ago. Sooner or later the South will be freed from its voluntary chains, and will grant freedom of thought and freedom of criticism, not only to those who live at a distance, but to its own moral heroes as well.

THE ROUSSEAU REVIVAL.

The revolutionary upheaval in Russia may seem to lend significance to the fact that last year there was begun at Kiev a translation of the complete

works of Jean Jacques Rousseau. Perhaps it does, seeing that the cultivated classes have long been as much at home in French as in the vernacular, which was at one period affectedly displaced as the vehicle of social intercourse for the *bon ton*. On the other hand, when we reflect how much of this voluminous writer's output has by lapse of time become either tedious or obsolete—when one recalls, among other things, his dictionaries of Music and of Botany—a non-selective translation of the *whole* appears rather a literary than a political event; a chapter in the history of the human intellect rather than in the development of human society.

Yet again, in the first volume of the *Annales* of the year-old Geneva Société J.-J. Rousseau, in which we find the above bibliographical item, occurs a letter from Tolstoy, written in French under date of March 7-20, 1905, giving his cordial adhesion to the Society in these terms:

"Since the age of fifteen, Rousseau has been my master. Rousseau and the Gospels have been the two great and beneficent influences in my life. Rousseau does not grow old. Quite recently I happened to reread some of his writings and I experienced the same sense of elevation of soul and admiration that I did in reading him in my early youth."

Here the circle of communion between the modern apostle of a return to primitive simplicity in living and the author of the 'Discours sur l'origine et les fondements de l'inégalité parmi les hommes' is obviously complete. Indeed, it is almost startling to discover a contemporary mind of the first order confessing to that subjection to the magic stimulus of Rousseau which was felt by Goethe and Schiller, Mme. de Staël, Bernardin de St.-Pierre, Byron, Shelley, Chateaubriand, Lamartine, Pestalozzi, and a host of other geniuses in close succession to the most eloquent of French writers.

Our present concern, however, is not with this theme, but with the manifestation which we have called a revival, though it is really the organized gathering up, in archives and in annual publications and in prospective editions of Rousseau, of the incessant researches concerning the man and his work, in Switzerland and Savoy particularly, which have of late years thrown a flood of light on the dark places of the 'Confessions.' The solid character of the new movement is attested by the scholars and specialists who have founded and will direct the Society, but also emphatically by the volume of *Annales* just issued by the house of A. Jullien at Geneva. Of its contents we shall not undertake a detailed account. Following the history of the foundation, the two leading papers are chapters of forthcoming works, one a memoir (by a descendant) of Dr. Tronchin, for his relations with Rousseau. In this is lucidly revealed the psychology of the detachment of a devoted admirer, at first sympathizing more, through his Puritanism, with Rousseau than with Voltaire; then, after the appearance of 'Émile,' siding with the latter in his open and veiled attacks on Rousseau, from a religious intolerance not shared by the cynic philosopher of Ferney, and creating a situation that justified the half-informed victim in inferring a close conspiracy. The other paper, not inferior in interest and but little in importance, is taken from the captivating memoir, 'Madame de Charrière et ses Amis,' just now issued.

Next to be remarked are some forty pages of unpublished, or hitherto imperfectly printed, fragmentary writings of Rousseau. Among these, the first, "On Women," dates from 1735, in the midst of his formative relations with Mme. de Warens. It is a defence of the sex against its alleged petty figure in the heroic annals of the race. When we read: "First consider women deprived of their liberty by the tyranny of men, and these the masters of everything (for crowns, dignities, offices, the command of armies are wholly in their hands) through seizure from the earliest times by I know not what natural right, which I have never comprehended, and which may well have had no other basis than the strong hand"—we seem to hear that passage from the *Chant du Lévite:* "Sex always either slave or tyrant, whom man by turns oppresses and adores, yet cannot make (or be himself) happy save by allowing her equality with himself." It is still a far cry to 'Émile' and Mary Wollstonecraft's counter 'Vindication of the Rights of Woman.'

Chief curiosity in this rich collection is the unpublished marginal notes by Voltaire written in a prompt copy of 'Émile' in 1762, as evidenced by a facsimile. The general tone is depreciatory, often personally contemptuous and bitter, yet "bon," "très bon," and "excellent" are sometimes extorted; for Voltaire is commenting on the Profession of Faith of a Savoyard Vicar, almost to the exclusion of the rest of the work.

"The Original Score of Rousseau's 'Pygmalion'" deals with a fundamental aspect of the many-sided man. The love of music and the cultivation of it were the constant strand in the web of his existence. Mme. de Charrière wrote that she had always believed it was Rousseau's ear which made him what he was—but with reference to the music of style. This opera dates from 1762 (the year of 'Émile'), and, like the earlier and world-pioneer "Devin du Village," was composed both for the words and for the music by the same brain, but at first, for the music, only in part. The two andantes were Rousseau's; the rest was claimed by a Lyons collaborator, Horace Coignet. Hence some cross-pretensions, which Rousseau finally met by recomposing the whole, and it is this second score, now preserved in the Royal Library at Berlin, which is discussed, with a reproduction, in the *Annales*. Authorship, however, is a consideration secondary to the conception of "Pygmalion," in which the title character does not sing, but speaks and recites, while the interspaces are filled sympathetically by the orchestra. Herr Istel properly couples this exposition of Rousseau's intent with a passage from the article *Récitatif obligé* in the 'Dictionnaire de Musique' (one of many, by the way, which enliven what is now pretty difficult steady reading), that dwells on the immense effectiveness of such coöperation between the actor and the orchestra—the crude germ of Gluck's subsequent practice and of Wagner's magnificent development.

We shall say no more except that the frontispiece to the *Annales* is a carbon print direct from Ramsay's portrait of Rousseau (1766), now in the National Gallery at Edinburgh—one of the two authentic paintings from life and by far the more interesting. On the cover is stamped the herborizing Jean-Jacques, as if in propitiation for a character so vehemently assailed by clergy and Philosophers alike. (So, a little more than a century ago—in 1801—a British engraving after the first mezzotints from Ramsay's portrait commended itself as the effigy of the author not of the 'Contrat Social,' the 'Nouvelle Héloïse,' or 'Émile,' but of "Letters on Botany, etc.") But this figure is really the Society's chosen emblem; and M. Eugène Ritter, in his introduction to the *Annales*, disclaiming for the Society any doctrinaire spirit or design of blind hero-worship, shows that it has deliberately passed over all other phases of Rousseau in favor of "the solitary pedestrian, Rousseau pacified and reconciled; the dreamer; bare-headed to the sky, meditating on the posy of wayside flowers and herbs he regards in his hand." "To him all can be grateful for having loved God, love, childhood, and the free and simple life in the midst of nature."

THE AMERICAN HISTORICAL ASSOCIATION.

BALTIMORE, December 30, 1905.

The programme of the Baltimore and Washington meeting of the American Historical Association, December 26-29, has been devoted almost entirely to American history. Of some twenty-five addresses or papers, only five dealt with other than the American field; and of those five, one—Professor Cheyney's paper on "The England of Our Earliest American Forefathers"—had an obvious American aspect. Such a predominant devotion to domestic matters seems hardly to show the reaction against American history which has come to characterize many of our colleges and uni-

versities, though of the fact of such reaction there can be little doubt; but it is frankly to be regretted that European history, in which an increasing amount of good work is being done in this country, was not more largely represented here. Further, of those who discussed European subjects, only one—Col. William R. Livermore of the United States army, whose paper related to plans for a new atlas of Europe—was a new name at the meetings. Clearly, however, the overshadowing Americanism of the programme did not act as a deterrent, for the sessions were well attended, and the meeting as a whole must be reckoned, both in numbers and in interest, one of the best ever held. As for the hospitality of those who received the Association as their guest, it was both gracious and abounding.

Professor McMaster, the first of the professorial presidents of whom the Association seems to have prepared a long line, chose for his address the alluring subject, "Old Standards of Public Morals." Those, however, who had anticipated some more or less obvious reference to current phases of public morality were disappointed, for Professor McMaster confined himself mainly to an historical presentation of certain striking instances, such as those afforded by religious intolerance, the cruel punishment of crime, and the repudiation of public debt, in which the moral shortcomings of our forefathers in America were only too painfully exhibited. Particularly effective, because in part more novel, was his condemnation of the bad faith of Congress in repudiating the Continental paper currency, for whose redemption the faith of Congress and of the country had repeatedly been pledged, and of the three generations of evasion and delay which characterized the treatment by Congress of the French spoliation claims.

Of the formal papers, two may be singled out for special mention. In a notably lucid and well-ordered paper, Prof. Ralph C. H. Catterall of Cornell traced in detail the part taken by Neuville, the French minister to the United States, in the negotiation of the Florida treaty of 1819. Neuville early pointed out in his dispatches the certainty that the United States would sooner or later have the Floridas, and with them, probably, a considerable extension of its territory west of the Mississippi; the only real question being when the appropriation would be made and how much would be taken. Spanish procrastination, joined to American persistence in the person of John Quincy Adams, eventually brought negotiations to a dangerous pause; and but for Neuville the treaty could hardly have been concluded at all, or war between the United States and Spain avoided. The paper was a good illustration of the wealth of important material still buried in diplomatic archives at home and abroad. Prof. William A. Dunning of Columbia, on the other hand, traversed the contention that the Republican party, whose alleged semi-centennial was celebrated with acclaim in 1904, is historically the Republican party of 1854. Whatever the traits by which a political party is to be defined, the facts seem to be that the Republican party of the late fifties and early sixties underwent a "new birth" in 1867 and 1868, through which, though retaining the old name, it came to occupy new ground and to profess new principles. Here, again, as in Professor Catterall's paper, was the indication of a large field—in this case that of party history—as yet little tilled.

The other papers on the programme—a few of which, unfortunately, were not read—covered a wide area, those in American history paying special attention to the South. Virginia and the English colonial system, 1730-1735; why North Carolina at first refused to ratify the Federal Constitution; Marshall and the Virginia Supreme Court; the freedmen's savings bank; Avalon and the colonial projects of George Calvert; and the theatre and combatants of the civil war, were among the topics treated with more or less fulness. Two of the papers on other than American topics have already been referred to; besides these, special mention may be made of Prof. A. C. McGiffert's paper on the rise of the modern conception of the Divine immanence, and that of Prof. J. H. Robinson of Columbia on recent tendencies in the study of the French Revolution.

Ever since the publication of the report of the Committee of Seven, the Association has maintained a lively interest in the teaching of history in colleges and schools, and the conference this year on the first year of college work in history was largely attended. The accounts of the methods pursued at different institutions showed, to be sure, much diversity of practice as well as wide difference in material equipment and resource; but there was substantial agreement upon the necessity of first of all interesting the young student in the subject, and of laying a sure foundation of historical method. The preceptorial system at Princeton received attractive, if not entirely convincing, exposition at the hands of Mr. Hiram Bingham, himself a preceptor; while Prof. H. Morse Stephens's plea for greater attention to the formal lecture touched one of the weakest spots in our present scheme of historical instruction. Doubtless it is given to few teachers to win and hold the interest of young men with the success which Professor Stephens himself happily enjoys, or which Prof. J. Lewis Diman achieved at Brown a generation and more ago; but the steady decline, in both literary and scholastic power, of the university lecture in this country is surely matter of serious import.

The varied activities of the Association continue with undiminished vigor. The Historical Manuscripts Commission will henceforth confine itself to the publication of such papers in private hands as are not likely to appear through other channels, leaving to the Bureau of Historical Research of the Carnegie Institution the task of making available the larger, more public, or more widely scattered collections. The Public Archives Commission is making steady headway with its great task of investigating the character and condition of State and local records, submitting this year reports on the State archives of Michigan and Wisconsin, the French archives of Illinois, and the local records of Georgia. Prof. Charles M. Andrews of Bryn Mawr and Herbert L. Osgood of Columbia, as a sub-committee of this Commission, are overseeing the transcription of papers in the Public Record Office for the Library of Congress—an undertaking which, if carried to completion, will eventually make accessible at Washington copies of all important documents in European repositories relating to America. Towards the State and local historical societies the Association can never, of course, hold any official relation, but such conferences as were held last year and this, in connection with the annual meeting, contribute appreciably to effective coöperation as well as to good fellowship. The membership of the Association grows apace, exceeding now 2,500, while the financial gain is, as usual, satisfactory. The meeting in 1906 is to be held at Providence, in connection with the meetings of the American Political Science Association and the American Economic Association.

INDUSTRY AND TAXES IN FRANCE.

TOURS, November, 1905.

The rapidity with which countries, even when devastated as thoroughly as the Palatinate, recover from the ravages of war, has led economists to compute the accumulated wealth of the civilized world as amounting to no more than three or four times the annual production. How comes it, then, that, in a country like France, where population is stationary, and where peace has prevailed for more than a generation, the condition of the peasantry has so little improved? Their industry is incessant; not always directed most effectively, but in the main intelligently, and often attaining a high degree of perfection. Their toil is not only assiduous—even the women not ceasing to knit when they are gossiping—but also severe. Even with antiquated methods, the product of such enormous—one might almost say such terrible—industry should raise the laborers to affluence. Yet in the most fertile parts, such as those watered by the Indre and the Loire, the life of the peasants seems not much better than what we read of in the descriptions of the times before the Revolution. The habitations, both of man and beast, are generally the identical ones then used; because of their solid construction not needing much repair, but inconvenient, dark, cramped, and generally the worse for wear. People stump and clatter about in wooden shoes, and their ordinary garments are of coarse cotton cloth. They are starved with cold, for they have little material for fire, except their pitiful fagots of brushwood and dead limbs, such as in our country are burned as rubbish. To be sure, their cooking is a small matter; the baker does most of it (and very well, too), and not much fuel is needed to stew a few vegetables and boil that mysterious substance called coffee. As there is little reading, artificial illumination is not of so much importance; but it is painful to see the women bending over their needlework in their struggle to discern the stitches by a feeble lamp. Probably the standard of life is higher than it appears, for the French peasant has been taught by centuries of oppression to be secretive, and he may have invisible resources; but it is not what his labor would justify. He has much comfort in his wine, even if it is only the poorest that he keeps for himself, and a meagre pleasure in the vile tobacco provided by the Government's monopoly—a pleasure lessened by the viler matches likewise purveyed; but he does not get his deserts.

What becomes of the product of his in-

dustry? In part, the eye gives answer. The magnificent châteaux, the costly churches, the enormous convents, show what was done under the feudal system; and the vast casernes thronged with myriads of peasant lads in blue coats and red trousers show what is done now. This half-million of able-bodied men, withdrawn from productive industry, must be fed and clothed and housed and officered by the labor of perhaps twice that number of workmen—a burden of appalling magnitude. The naval establishment, although on a smaller scale and less conspicuous, is also an enormous burden. The employees in the navy yards, exercising a dubious right, have formed unions, and recently struck work because some of their number had been disciplined for denouncing militarism. The Government, depending for its existence on the workmen's votes, was obliged to justify its denial of the right to strike on the ground that its employees were a favored class. Other workmen must toil ten or twelve hours; its workmen only eight. Other workmen are laid off when they are not needed; its workmen are paid whether there is anything to do or not. Other workmen are liable to be dismissed by their masters; its workmen hold their places until they are of an age to retire on their pensions, which are payable also to their widows and children, and are twice as large as those offered to outside workmen by the bill now pending. Under these circumstances, the ordinary workingman can hardly be expected to think that the employees of the Government need the right to strike.

Further evidence is afforded to the senses in the enormous public buildings that have sprung up in the towns, large and small, flaunting extravagance in their gaudy architecture. Here in Tours, for example, there is not only the vast Préfecture, but also, in addition to many other buildings, an enormous, and enormously expensive, new Hôtel de Ville. The population of the town is 65,000; but this building would be sufficient for the proper administration of a town ten times as large. Many of the railroads, constructed by the Government or with its guaranty, are obviously unprofitable; and even the roads, brought through centuries of labor very nearly to perfection, often bear signs of the stupidity and extravagance of a centralized administration. Yet here, we must concede, the peasant receives something like an equivalent for his tax, and it is pleasant to see the draft horses so aided in their work. As to the schools maintained by the Government, it is hard to make out that they increase the intelligence of the common people; and the quality of the teaching is bitterly complained of. Still, the ability to read and write is worth paying for, and may be said to be cheap at any price.

But the great burdens upon industry are not disclosed to the eye. To understand them it is necessary to study the history of France for five centuries, to compute the debts which represent the price of military glory, and to examine the details of the terribly intricate system of taxation which now prevails. It is unnecessary to dwell on the results of a protective tariff. France is naturally a poor country. The soil is in many regions sterile, the forests are inferior, and there is little mineral wealth. But it has a population capable of intelligent industry, capable of giving to matter attractive and beautiful forms. To such a country free importation would be peculiarly advantageous, resulting not only in large exportation, but also in better conditions of life. France is poor in coal, but the coal of England is easily accessible, and if it could be imported freely the stimulus to many forms of industry would be great. Could sugar be imported freely, no people could manipulate it with greater skill than the French; but the miserable history of the beet-sugar industry is notorious. The careful investigations of M. Zolla indicate that the tariff enhanced the price of wheat from 1896 to 1900 by four francs the hectolitre; and bread is the staff of life in France. M. Caillaux (former minister of finance) considers that the protective tariff imposes a burden of probably two milliards of francs on the consumer.

It may be added that before the Government monopolized the making of matches, the exports of that article amounted to eight millions of francs a year. With the growth of trade during the last thirty-five years, these exports might well have attained to twenty or thirty millions. They amounted in 1904 to less than forty thousand francs! Sometimes the Government fails to furnish the requisite supply, and Belgian matches, of better quality than the French, are bought at a cost of 130 francs the million. The cost of making that number in the Government shop is 180 francs, and this does not include the charge for pensioning the workmen when they retire. These posts in the shops of the Government are apportioned, of course, as political favors, and those who yield them usually succeed in keeping the office in the family.

If the tariff taxes are ruinous, what shall be said of the internal imposts? To try to number them would be vain; they begin with the birth of the child, cover his every act in life, and fall on his estate after his death. The system of petty entails established at the Revolution, and the restriction of testamentary disposition, compel the division of land into fractions, or its sale at a ruinous expense. After the onerous taxes on these operations are paid, the portion of the widow, should the estate going to her equal $200,000, is taxed $14,000; that of the children, should they succeed, $6,000—to say nothing of the enormous legal charges affecting the complicated process. Of course, gifts during life are taxed to correspond, and transfers of property of every description are so costly as to discourage every form of investment. Every transaction requires the use of stamped paper; and for fear that enough may not be used, the number of lines, as well as the size of the page, is prescribed. The complexity of the system is so frightful that professional aid is constantly required. A body of intermediaries, charged with applications made to the various bureaus, has grown up, and their existence has been recently recognized by the law, the annual value of their offices being placed at 100 millions. The number of claims arising from a single department of taxation, the direct contributions, averages over 300,000 a year. The amount of annoyance and distress expressed by such figures cannot be measured in money, but it represents a terrible economic loss. Any one accustomed to watch for opportunities for investment can see that France requires many things that capital would be glad to furnish. Outside of Paris, even in large towns, the conditions of life are frequently rather primitive, and it would apparently be profitable to improve them. But when one ascertains the number and extent of the taxes on corporations, their capital, their obligations, and their ordinary proceedings, there is little inducement to invest in any French enterprise—unless one can obtain a subvention from the Government. The expense of transferring title to a piece of property often equals two years' income therefrom. This is the reason why the French have taken so many hundred millions of Russian bonds. From political considerations the French Government does not tax these bonds, and it has seemed preferable to obtain a return of four or five per cent. in this way, rather than to encounter the exasperating obstructions of the fiscal régime at home.

The industry of France has thus to support not only the army of soldiers, but also the equally large army of public functionaries. The total of the budgets is probably not less than four milliards; the service of the national debt, together with the pensions, costing 1,300 millions. To some extent the national debt, to a greater extent the debt of the minor political organizations, represents productive investment. But by far the greater part stands for losses incurred in war and in preparation for war. The interest paid on this debt brings no return to the country; it means that those who draw it render no service to production. Under the republic this debt has steadily increased, and there is always a deficit. The deficiency cannot be covered by new taxes, for it is doubtful if higher taxation would bring in more revenue. Every one shudders at the budget, but the Government will not economize, and it must therefore borrow. To go to war would mean national bankruptcy, and the great army of office-holders is interested to maintain itself, and throws its influence with that of the *rentiers* in favor of peace. The evils of the situation are clearly understood, and the remedies are known; but, as I have said, the Government will not economize. To explain why would make this letter too long; but the difficulty is stated by M. Caillaux. "Mettre un terme aux privilèges. Or, c'est la chose la plus difficile qui soit dans un pays où les classes qui détiennent le pouvoir ou en approchent ont toujours déployé une sauvage énergie pour défendre les abus dont elles bénéficient." MacG.

Correspondence.

"THE COLUMBIAN IDEA."

To the Editor of The Nation:

Sir: Anent Mr. Penniman's note in your issue of December 21, permit me to say that the practice of allowing students to carry extra courses and to graduate on the completion of the required work is not confined to Eastern universities. This custom has been in vogue in the University of Iowa for fifteen years, though it has never been

styled the "Iowa Idea." However, it is our policy to grant this privilege to those students only who have proved their capacity to do this added work and maintain high scholarship. For the average student, four full years in the university atmosphere, employed with strictly undergraduate courses unmixed with technical or professional studies, is quite brief enough.

AMOS N. CURRIER.

UNIVERSITY OF IOWA, December 26, 1905.

KEATS'S PAYNIMS.

TO THE EDITOR OF THE NATION:

SIR: I am gratified at having been pilloried in the *Nation* (November 23, 1905) for my rash attempt to emend a line of Keats, inasmuch as the incident has called forth the interesting comments of Dr. Garnett in your issue of December 21—this, even though I find myself classed, for my lack of understanding, with the French translator who rendered "Paynims" by "prêtres." But I must disclaim the imputation of having thought that "clasp'd" (the line reads, "Clasp'd like a missal where swart Paynims pray") here means "embraced." The rejected variants, "Shut like a missal," and "Like a shut missal," recorded in Buxton Forman's edition, are sufficient commentary. Nor does it seem to me that Leigh Hunt fell into any such error. The head and front of my offending is simply this, that, in view of Keats's somewhat erratic spelling, I suggested in *Modern Language Notes* (September, 1905) that "pray" might be really an error of the pen for "prey," especially as Keats must have seen the word regularly so printed in the text of his favorite Spenser. To my poor judgment, "prey" seemed a more likely reading than "pray," in that it calls up the image of the Paynims in what is in all romance their characteristic aspect, that of enemies of Christendom.

All that is unselfish in me is gratified even at the pillorying itself, for "Philologus" certainly afforded the readers of the *Nation* mirth, albeit at my expense. It is something to have added to the gayety of the *Nation*.

W. STRUNK, JR.

ITHACA, N. Y., December 26, 1905.

THE ARRANGEMENT OF MUSEUMS.

TO THE EDITOR OF THE NATION:

SIR: The policy of æsthetic management of museums of fine arts, which you advocate in your editorial entitled "Two Theories of Museum Policy" (*Nation*, No. 2113), appears to me beset with dangers. The primary function of a museum of fine arts is, I conceive, to make accessible a wide range of materials—chiefly works of art of past ages (contemporaneous art being accessible enough outside of museums). The objects in museum collections ought to be, as far as possible, well lighted, arranged in their natural groups, properly catalogued, and properly cared for. Beyond this, museum management ought not, I think, to go. To influence choice as to what should be studied, any further than to include only objects which have stood the test of time and are thus recognized by a general consensus of opinion as of standard quality, appears to me questionable, and even hazardous. The proposed æsthetic policy would undertake to direct choice. It would assume that the intelligence of the public cannot be trusted, and that museum directors are competent to direct choice wisely. But certainly, at least in the present confused state of ideas on the fine arts, no director, or body of directors, can be safely entrusted with any such function. Neither personal nor corporate preferences ought to be imposed on the public. To cull out of a large collection a few objects that a given body of administrative officers may consider most worthy of display, and to arrange these on supposed æsthetic principles, about which there would be an endless variety of opinions, appears to me objectionable on all grounds.—Yours very truly,

CHARLES H. MOORE.

CAMBRIDGE, MASS., December 30, 1905.

Notes.

The Macmillan Co. have just issued the first volume of 'Supplementary Papers of the American School of Classical Studies in Rome.' This series is made necessary by the fact that it is not possible to find room for all the material in the *American Journal of Archæology*. The volume contains papers by the director of the school, Prof. Richard Norton; by Mr. Thomas Ashby jr., the vice-director of the British School in Rome; by Dr. Arthur Mahler, lecturer in the American School, as well as by several of the fellows and students. The price is three dollars, and correspondence with reference to it may be addressed to the publishers, or to Prof. Samuel Ball Platner, Western Reserve University, the secretary of the committee.

Quicquid delirant reges, plectuntur the editors of the *Almanach de Gotha*, whose 143d issue is before us (Lemcke & Buechner). Both Russia and Japan had warring hands too full to extend the usual statistical courtesies to this most respectable of year-books. Even the financial minister's annual financial report had to be procured from Tokyo through the German legation. The editors were mighty curious, also, as to Japan's strictly honorable intentions towards Korea, but going to press was imperative at an hour too early for the news of the protectorate. The little trouble between Sweden and Norway and the doubt as to the new King further heightened the *Almanach's* perplexities as a faithful, up-to-date chronicle. The four regulation portraits this year are all German—the newly-wedded Prince and Princess Imperial and Duke and Duchess of Saxe-Coburg and Gotha.

The plain form of Ginn & Co.'s "Standard English Classics" suits very well the chunky volume of 'Henry Esmond,' edited for school use by Hamilton B. Moore. As all the apparatus, save a brief introduction, is at the end, the reader will not be conscious of using a text-book, though now and again he may gladly resort to the judicious notes.

Three historic New England families are interwoven in a quaint little output of the Merrymount Press, Boston, entitled 'The Course of True Love in Colonial Times: Being the Confessions of William Palfrey of Boston and the Friendly Advice of Moses Brown of Providence concerning Polly Olney.' The letters are in the possession of the Rhode Island Historical Society. The chief writer was grandfather of the historian Palfrey, less well remembered than his brother-Mason Moses Brown, though his rank and services during the Revolution were conspicuous; but this little tragedy, ending, as the advertisements at the end show, in Thomas Greene's getting Polly, and Palfrey solacing himself with Sally Cazneau, was enacted in 1761-4. The booklet has been happily conceived by editor and printer.

The innumerable tribe of the Pilgrim father John Alden is partially illustrated in a thin volume, noticeably free from padding, very businesslike, very candid in keeping within the region of the known rather than the traditional, entitled 'The Descendants of Polly and Ebenezer Alden,' and prepared in two sections by their grandsons, Ebenezer Alden and Henry Shaw, M.D. The prefatory chapter on Alden history is made valuable by several unpublished documents, especially a deed of Deborah Allen's in 1789, which indispensably straightens out the pedigree. Some autographs of the *Mayflower* Pilgrims are given. These excellences are offset by a mode of reference from father to son truly antiquated. New England genealogists of the first rank have established a system not to be improved upon, and we regret that it has been discarded in this instance. The publishers are George H. Ellis & Co., Boston.

We trust that the group of tourists whom Mr. Charles Gibson has bundled about 'Among French Inns' (Boston: L. C. Page & Co.) are not really typical of their respective nationalities. His conventional rich American couple, with a marriageable daughter and three foreign suitors in tow, lend no added charm to travel in France; they are, indeed, the very kind of wanderers the real traveller will with alacrity avoid. The guide-book information with which the story is interrupted, is generally sound; the illustrative photographs are successful. But we see no *raison d'être* for such sage remarks as that "Men and women, under the cardinal influence of love, are not as others, and may not be judged as they are" (p. 307).

Miss Wormeley's 'Portraits of the Eighteenth Century' (Putnams), translated and adapted from Sainte-Beuve, include some of the critic's most complete studies, such as Lesage, Montesquieu, Voltaire, etc., for the most part accurately rendered, and disposed in such fashion as to convey a general impression of the interesting pre-Revolutionary epoch. On page 82, however, the omission of the first clause robs the following epigram of its point: "*On nous réconcilia*, nous nous embrassâmes, et depuis ce temps-là nous sommes ennemis mortels." In the article on Madame Geoffrin, the expression, "un homme *d'esprit*" applied to the Abbé Trublet, should not be rendered "a man of intellect" (p. 397). Scherer's judicial essay on Sainte-Beuve introduces this collection.

In the translation of Mme. Arvède Barine's excellent work, 'Louis XIV. et la Grande Mademoiselle' (Putnams), fair justice is done to the original; with a few apparently inevitable lapses, however, which seem to indicate slackened attention. Who, for instance, are the *Euridite* (p. 63) consulted in regard to Mazarin's supposed marriage? The French text is *les Érudits*. Charles II. (p. 137) *guards* a grudge, because

the original says *gardait*. "The peasants of Eu were *deranged* in their work of moles" (p. 163) is certainly not English. We do not wish to carp over trifles, but inaccuracies of this sort have still their excuse to find.

Dr. Carl Schnabel's 'Handbook of Metallurgy' for all the useful metals except Iron was first issued in 1894, and the English translation of Henry Lewis followed in 1895. The first volume of the second German edition came out in 1901, and has just appeared in translation by the same author (Macmillan). The second volume of the English translation of the second German edition, which appeared last year, is promised in 1906. It is the best book of its kind, and that is the best that can be said of it. Any single treatise covering so wide a field as universal metallurgy must be a compilation, and all compilations must of necessity contain much irrelevant and incorrect material. The arts are progressing so rapidly, and their practice is becoming so specialized, that few men are competent to tell the whole story of such an intricate and diversified subject as the treatment of all the metals; and if any man were competent, while writing it most of what was new when he began would be old ere he had finished. It is true that antiquated methods may be historically interesting and useful in the discussion of principles, but a handbook which should undertake to deal intelligibly and exhaustively with theoretical as well as practical details, would extend into far more than two volumes, and would cease to be a handbook. Nevertheless, Professor Schnabel's two volumes constitute a useful textbook, replacing Crook and Ruhrig's edition of Bruno Kerl, now quite out of date, and Percy's famous series of treatises, in which metallurgy was treated theoretically and experimentally. These are not only out of date, but out of print. This first volume of the second German edition treats, as did that of the first edition, of the metallurgy of copper, lead, silver, and gold. In the section on copper, greater space is given than in the first edition to two departments which have of late years acquired increased importance, namely, the pneumatic method (the Bessemer) of concentrating copper mattes, and the refining of copper electrolytically. But in the section devoted to lead, nothing in the second edition is added to what appeared in the first except a few paragraphs on the smelting of mixed ores and the manufacture of some merchantable lead compounds. Even such an improvement as the Heberlein process is not referred to. In the description of gold processes the cyanide method and its application, especially in the Transvaal, are treated with fuller detail than in the first edition.

The *Geographical Journal* for December contains the suggestive address of Sir C. R. Markham at the opening of the new term of the School of Geography at Cambridge University, on the sphere and uses of geography. He sketches the development of "the mother of all sciences," and, with interesting illustrations from facts, shows its importance in settling international questions as to boundaries, in explaining history and developing commerce and industry. Dr. Nansen discusses the problems presented by the oscillations of shore lines, and remarks in conclusion that the evidence seems to indicate that the level of the ocean has, on the whole, risen somewhat during late geological times. This article, and L. C. Bernacchi's account of the physical observations conducted on the National Antarctic Expedition, are accompanied by a full report of the discussions following their presentation to the Royal Geographical Society. Lieut.-Col. Delme-Radcliffe describes most graphically the western part of Uganda, its people, animals, and more especially its botany, and Mr. Ravenstein contributes a biographical notice of the late eminent geographer, Baron von Richthofen.

Substantial progress in Asia is indicated by two noteworthy incidents in the tour of the Prince of Wales in India. Among his guests at the great camp at Rawalpindi on December 7 was the Grand Lama of Tibet, the spiritual sovereign of the Buddhists since the flight of the Dalai Lama of Lassa to Urga in Russian Mongolia. That he should undertake a journey of more than 2,000 miles to greet the Prince, shows that the opening of Tibet is an accomplished fact, and that the century-old seclusion in which her ruler lived is no longer enforced. Two days after this reception, at a banquet given the Prince at Satwarl, the Maharaja of Kashmir announced his intention of establishing a State College for the benefit of all classes and creeds among his subjects, and asked permission to name it the Prince of Wales College. This native prince, it may be added, is also building an electric railway, the motive power being furnished by the River Jehlam.

In the *Globus*, Dr. Goldberg of Wilna furnished some interesting language statistics of the five million Jews of Russia, according to which they constitute a national and linguistic contingent unassimilable with the general body politic. Their language is the "Yiddish," the well-known composite or jargon based on the German, but with Russian and Hebrew admixture. The writer asserts with a show of statistics that 976 out of every 1,000 Jews in Russia speak this dialect. Only 65,000 Jews make use of the Russian and 98,000 of the Polish tongue. He declares that the Jews as a body show not the slightest indication of assimilation with the State in which they live.

The Berlin papers report that the Royal Library in that city is already giving evidence of the management of the new General Director, Professor Harnack. Changes in the rules regarding the time during which books may be kept, a decrease in the fines imposed on delinquents, the introduction of a system of notification in case books are not returned promptly, the opening of the entire library to the student body, and similar innovations show that the purpose is to expand the usefulness of this great institution.

The papyri found in the University Library of Strassburg, one of the best collections in Europe, are now to be thoroughly examined and catalogued by Dr. Preisigke. The *Vossische Zeitung* states that he has already begun the task, though he cannot give it his undivided attention, as his profession is that of telegraph director; yet he has promised to publish the first *Heft* soon after New Year's. The collection is particularly rich in documents from the period of the Ptolemies. The next best collection of papyri in Germany is found in Heidelberg, and here Dr. Gerhard has been engaged in cataloguing for months. As first-fruits Dr. Deissmann has published a beautiful edition of Septuagint fragments, and these are to be followed by other documents.

Hitherto it has been generally accepted that the oldest recorded reference to the use of stenography among the ancients was in a papyrus found by Grenfell and Hunt, dating from the year 155 A. D. In the tenth *Heft* of the *Archiv für Stenographie*, however, Dr. Priesigke describes a reference of a much earlier date. In the new Oxyrhynchus finds a letter has been discovered written by a certain Dionysius to his sister Didyme, dated the 15th of November, 27 A. D., in which he complains that she writes to him neither in the ordinary nor in short hand.

On December 15 a dinner was given by the history tutors of Balliol College in honor of Mr. R. L. Poole and of the twentieth year of his connection with the *English Historical Review*. A remarkably representative gathering of its contributors assembled to the number of nearly 150. Men predominated numerically only, since the activity of the women contributors has been a remarkably conspicuous feature of the *Review*, and many of these were present. The dinner gave occasion for the presentation of what Mr. Poole appreciatively designated in returning thanks as "splendid trophies." Mr. James Bryce, who tendered them, spoke not as the new-fledged Irish Secretary, but as the writer of 'The Holy Roman Empire.' Indeed, it was Mr. Bryce who, with the late J. R. Green, conceived the need for an historical Review nineteen years before he joined Mr. Poole and others in actually founding one—the one which all know. Mr. Bryce was followed by the Regius Professor of Modern and the Camden Professor of Ancient History, and by others as well as the Corpus Professor of Jurisprudence. It was universally acknowledged to be most fitting that Balliol College, where the teaching of history has been developed upon such unusually solid lines since the founding of the *Review*, should gather within its walls all the scholars, wherever trained, who have recently illustrated English historical study—the more so, no doubt, because Mr. Poole, now a fellow elsewhere, spent his undergraduate days at Balliol.

Elsewhere we have spoken of the Swiss Société Jean-Jacques Rousseau, and we bespeak membership in it for every public library in the country. The *Annales* alone will more than repay the very moderate yearly fee of twelve francs, while putting all Rousseau students abreast of the progress of research and publication. The president is Prof. Bernard Bouvier; the treasurer, M. Alfred Cartier, 11 Boulevard des Philosophes, Geneva.

—The Caxton Club of Chicago has recently broken away from its custom of issuing chiefly books of interest to collectors and students of Americana, and begun to put forth works that are of direct value to collectors and bibliophiles *per se*. Last spring we had occasion to notice Mr. E. Grant Duff's monograph on William Caxton, and a few months ago a translation, by Miss Mabel McIlvaine, of M. Octave Uzanne's 'French Bookbindings' appeared under the auspices

of this club. Its latest publication is Mr. A. W. Pollard's 'Essay on Colophons,' with an introduction by Richard Garnett, which presumably will prove to be most practically useful of all its publications. Dr. Garnett tells of the origin and meaning of the word, and shows how the custom of adding colophons to early printed books, giving the title, the name of the author and printer or publisher, and the place and date of printing, was adopted, like so many other technicalities, from the practice of the scribes, and points out its significance in the history of early printing, and the need of studying it. "It is no unimportant matter," he says, "for every determination of the locality of an early book is a paragraph added to the history of the culture of the country where it originated." To offer an introduction to such study is the purpose of Mr. Pollard's essay. It is virtually a collection of colophons, in original and translation, connected by a slender (but by no means too slender) thread of comment, and grouped under such heads as "Colophons at Maiuz"; "Colophons at Venice"; "Printers' Colophons"; "Colophons of Authors and Editors." They are arranged, in each group, so as to show their value as materials for the study of printing and publishing, and the author's comment serves to bring out their salient points; for instance, where he shows from the colophons of four books printed by Jenson in Venice that one of them contains an error in the date of imprint. The last chapter is wholly devoted to the subject of "Dates in Colophons," and contains some useful tables, such as lists of popes, kings of England and France, and doges of Venice during the latter part of the fifteenth and the major part of the sixteenth centuries, and the dates of Easter Day from 1470 to 1521. The book was printed at the DeVinne Press, in fine shape, aud contains several facsimiles.

—The first volume of Albert H. Smyth's 'Writings of Benjamin Franklin' (Macmillan) outliues the plan of the work, and contains a sketch of Franklin's many activities. As the third general compilation of Franklin's writings, it must stand against the work of Sparks and Bigelow; and if the promises made are performed, it will surpass in scope and in utility these earlier issues. The editorial vagaries of Sparks are to be corrected, and a return had to the original manuscripts, wherever found. A more careful examination of original sources, for which Mr. Smyth has exceptional opportunities and a sharpened critical sense, will enable him to correct the errors of Bigelow and add to the quantity of available Franklin material. Above all, the Franklin Papers in the American Philosophical Society, comprising some 13,000 documents, will now be studied for the first time in connection with such a compilation, and this study already bears fruit in the side-lights thrown on Franklin's productions. Yet Mr. Smyth does not promise to use all that Franklin wrote. He rejects the essays on free thought and on earthquakes as too crude and immature; he will omit what Franklin said of the effect of the diurnal motion of the earth on the length of sea voyages; and, while printing the pamphlet prepared by Jackson and Franklin, he will not include the "Historical Review of the Constitution and Government of Pennsylvania." The idea recently advanced by Bigelow, that the speech attributed to Jonathan Shipley was the work of Franklin, is not accepted, for very good reasons. But 385 letters and forty articles not previously printed by any editor will atone for omissions. The claims of Franklin as an economist are examined. He anticipated Turgot in the explanation of natural interest, and Malthus in one feature of the theory of population. He followed Petty in a labor theory of value, and the Physiocrats in believing agriculture to be the only legitimate source of wealth. He was a free-trader, and Mr. Smyth quotes from a hitherto unknown letter to Collinson (1764): "In time perhaps mankind may be wise enough to let trade take its own course, find its own channels, and regulate its own Proportions, etc. At present most of the Edicts of Princes, Placærts, Laws and Ordinances of Kingdoms and States for that purpose, prove political blunders. The advantages they produce not being *general* for the Commonwealth; but *particular*, to private persons or bodies in the State who procured them, and at the expense of the rest of the people." The editor points out that the political and economic writings of Franklin were in the nature of campaign pamphlets, written for a particular occasion rather than to embody a general view or theory of the matter treated. This in no degree takes away from the merit of these pieces, which are replete with sound maxims. No little stylistic repetition is to be found, and Mr. Smyth counted seventy-three repetitions of "industry and frugality" without exhausting the number of times the phrase occurred. This volume contains the autobiography, the complete text of Bigelow being used. We have noted a few slips in proofreading—"Simancos" for *Simancas*, "Whatly" for *Whately*, and the "Duc de" Nemours where Dupont de Nemours is clearly intended.

—We have before us a pamphlet, by Mr. Joseph De Perott, entitled 'The Probable Source of the Plot of Shakspere's "Tempest,"' which was issued in October as No. 8 in the first volume of "Publications of the Clark University Library" (Worcester, Mass.). We confess we do not see how even so guarded an adjective as "probable" is applicable in a case where the unbiassed reader requires some moments of reflection to detect any resemblance at all. The supposed source is a Spanish romance of chivalry called 'Espejo de Principes y Caballeros,' which in its original form was published at Saragossa in 1562, and of which two successive continuations by different hands appeared in the course of the next thirty years. The work was translated into English, as "The Mirrour of Princely Deedes and Knighthood,' in nine volumes, which were issued at intervals between 1579 and 1601. It was also translated into French under the title of 'Le Chevalier du Soleil,' a copy of which work is to be found in the Congressional Library at Washington. Neither the Spanish nor the English form of the romance seems to be accessible in this country, and Mr. De Perott's discussion is based on the French version. As already intimated, this scholar in our judgment fails entirely to establish his main thesis. The pamphlet, nevertheless, has a certain interest as offering a new and undoubted parallel—from the same Spanish romance—to the cardinal incident of the plot of another one of Shakspere's plays, viz., "Much Ado About Nothing." We refer to the incident of the impersonation of Hero by her maid in that play. To be sure, the version of this story in the Spanish romance is not only not original, being probably based on the similar episode of Ariodante and Ginevra in Ariosto's 'Orlando Furioso,' but is, on the whole, inferior in its variant features. Nevertheless, it will have to be mentioned among the parallels in any future treatise dealing with the sources of Shakspere's plays, although certainly not itself a source, as, with a discoverer's enthusiasm, Mr. De Perott claims it to be.

—Inasmuch as the pamphlet in question is not likely to come into the hands of many of our readers, we will say that the main feature of the story in this Spanish version is that the Don John of the plot (here called Robert, Duke of Saxony), being himself in love with Policena, a princess of Austria (who corresponds to Hero), bribes a female attendant of this lady to personate her mistress, and in his own behalf plays the rôle which is assigned to Borachio in "Much Ado About Nothing." So far the author apparently is simply following Ariosto. Instead of making the successful rival, however, the witness of the pretended shame of his lady-love, as we have it in Shakspere and Ariosto, and as a proper dramatic interest requires, in the Spanish romance the villain arranges that three knights shall be present, who afterwards support with their testimony the accusations against Policena's honor made by their chief. Unlike Claudio and Ariodante, however, the lover in the Spanish story, Luciano, never wavers in his faith in the innocence of his mistress. He denounces her accusers before the King as traitors, and it is decided that the question shall be settled by a combat between the principals, assisted by their knights. In this combat Luciano triumphs, and his rival is forced to confess his villany. It is hardly necessary to point out that the story in "Much Ado About Nothing" is closer to Ariosto than to the Spanish romance, although the majority of Shaksperian students are hardly inclined to accept even Ariosto as the immediate source of the story of Hero, as Mr. De Perott seems to assume.

—'Who killed Sir Edmund Berry Godfrey?' is a question which has frequently been asked, but it is reserved for Mr. Alfred Marks to use it as the title of a book (Burns & Oates). No one writing on a great historical mystery can avoid the tone of a controversialist, and in the case of Godfrey's assassination the evidence of the seventeenth century is so open to suspicion that every incentive is given the ingenious mind to work out a new hypothesis, or to defend an old hypothesis by novel arguments. In opening this little study by Mr. Marks, one thinks at once of Mr. John Pollock's book on the 'Popish Plot'; and though perhaps we should not be justified in styling the present essay a set answer to Mr. Pollock, it is to all intents and purposes a rejoinder. According to Mr. Pollock's view,

the evidence of Bedloe and Prance regarding Godfrey's murder in Somerset House cannot be set aside, despite the discrepancy of these two witnesses in point of detail. The 'Popish Plot,' he further maintains, was not wholly a ghastly hoax, but took its rise from a genuine attempt of the Papists to capture the Government of England. "Some truth there was, but dashed and brewed with lies," says Dryden; and Mr. Pollock, while not so paradoxical as to defend the testimony of Oates and his fellow, considers that in Coleman's correspondence with Père La Chaise may be found proof of definite and treasonable plotting. Godfrey came to his end through Jesuit instigation because, by accident, he had gained possession of a secret which, if revealed, would have cost the Duke of York his last chance of succession to the Crown, and perhaps his life.

—Mr. Marks's attitude toward the plot is altogether different. In his opinion Godfrey was not and could not have been killed in Somerset House, and all the arguments which can be collected to show that he had an erratic and melancholy disposition are marshalled in favor of his suicide. Not only does Mr. Marks strike at Mr. Pollock's version of the case so far as the testimony of Bedloe and Prance is concerned, but he scouts the notion that Godfrey was in possession of a fatal secret. "Every Christian community, from the Catholic to the Muggletonian, applies to itself the divine command, 'Go ye into all the world and preach the Gospel to every creature.' . . . But what we have to consider when we are asked, Was there a popish plot? is not, Was there a design to convert England? but, Was there a conspiracy to murder the King, and to massacre Protestants, to burn London, to overrun England with foreign armies?" If there were no plot of this description, there could have been no special motive for taking Godfrey's life. Further considerations in favor of the suicide theory Mr. Marks derives from the opinion of a surgical expert, Dr. Freyberger. Stripped of technical language, and largely abridged, the professional testimony thus adduced may be summed up as follows: Godfrey was a tall, strong man, who could easily have destroyed himself with the thrusting sword of that period, a weapon which was sharpened at the end, "with blunt edges along the rest of the blade." The marks of strangulation and the "bruising" of the chest and abdomen were, according to Dr. Freyberger, due to post-mortem hypostasis. Mr. Marks writes forcibly, and makes the most of his arguments, but the contemporary evidence is so hopelessly tangled and open to suspicion that we fear the mystery must remain insoluble.

—That far from superfluous veteran, M. de Molinari, has republished from the *Journal des Économistes* a number of his studies, under the title 'Questions Économiques à l'Ordre du Jour' (Paris: Guillaumin & Cie). In one of the most effective of these essays ("Où est l'Utopie?") the author replies vigorously to those who sneer at the ideal of progress through free competition, by asking for the ideals of militarism and socialism. Judging by their results, these systems do not hold out an alluring future to mankind. In the essay on the Brussels Convention the author contends that the action of the English Government in agreeing to levy a tax on sugar imported from countries where bounties are paid for its production, was not opposed to the principle of free trade. His argument is that free trade is not a matter of policy on the part of individual nations, but a principle applying to all mankind. England, beholding the inhabitants of other countries groaning under these bounties, was not merely justified in taking measures to abolish them; it was required by humanity. The pecuniary sacrifice made by the English people was great, but the pecuniary gain of the peoples of Europe was greater. Furthermore, the suppression of these bounties was a blow to protectionism. Nations, no more than individuals, have a right to be selfish, and it is the duty of one nation to make sacrifices for the benefit of the rest. We are not sure that M. de Molinari's views are not those of a Frenchman rather than of a free-trader. In the first place, the English Government consented to impose the tax partly for the purpose of bolstering up the West Indian planters, partly as a sop to the Imperialists, and not from the exalted motives assigned by their French apologist. In the second place, to fix taxes under the influences of particular interests is of the essence of protectionism; and, in the third place, it is bad policy for any Government to allow the taxation of its subjects to be controlled by a commission of foreigners. We cannot think that protection has received a blow by the action of the convention; and, while we rejoice at the relief accorded to the subjects of the Continental Powers, we are unable to regard it as really tending to the attainment of M. de Molinari's lofty ideal.

SCOTT'S VOYAGE OF THE DISCOVERY.

The Voyage of the Discovery. By Capt. Robert F. Scott, C.V.O., R.N. London: Smith, Elder & Co.; New York: Charles Scribner's Sons. 2 vols. 1905.

The extraordinary activity which has marked the progress of polar research during the last fifteen years, must convince even those most skeptical as to the wisdom of this form of human activity that interest in its outcome shows no signs of waning. Neither the misfortunes of the *Polaris*, the *Jeannette*, and the "Lady Franklin Bay" expeditions, nor the still partially-veiled mystery surrounding the fate of the Franklin party, appears to have chilled the ardor of new aspirants for Arctic fame; nor have they blinded the eye of the scientist to the many possibilities for discovery which the regions of the far north and far south still offer. The remarkable success which has attended the explorations of Nansen, Peary, Sverdrup, and the Duke of the Abruzzi, and in a minor way those of Gerlache, Borchgrevink, Drygalski, and Nordenskjöld in the antipodal portions of the earth's surface—a success unquestionably due in greater part to a more accurate study of the methods of exploration—could hardly have failed to stem the tide of an opposing public sentiment; and one is forced to conclude from Capt. Scott's narrative that an entirely new lease of life has been given to almost every form of polar research. One need hardly seek for the basis of this conclusion in the work accomplished by the British National Antarctic Expedition of 1901-04, for the keynote is already sounded in the statement of its commander (vol. ii., p. 407)—a statement that many will consider the most astonishing in a narrative full of surprises—that during the month of February of any average year "a ship, by coming directly south on the 178th meridian, could reach the Great Barrier without encountering any pack-ice." And further: "It is strange to think there may be a season in the year when the enterprising tourist steamer may show its passengers the lofty smoke-capped form of Mount Erebus as easily as it now does the fine scenery of Spitzbergen." For upwards of half a century following the famous expedition of Sir James Clark Ross, when that intrepid navigator was stopped in latitude 78 degrees S. by the great ice-barrier which subsequently bore his name, it has almost universally been believed that the approach to the antarctic tract was one of extreme hazard; so difficult, in fact, as to relegate explorations in that "ice-barred region" to the category of mere ventures. On the other hand, we have already learned from the numerous Peary expeditions that Melville Bay, the great concern of earlier Arctic navigators, presents an equally free passage during several weeks of each year. One might be tempted to infer that physical conditions have undergone recent modification, but it is incontestable that such is not the case.

The narrative of Capt. Scott easily takes rank among the foremost books of travel and discovery which a half-century has brought out, and it will be read with the same pleasure that both old and young like to associate with the reading of Livingstone and Kane. It is, however, superior to these works, and we feel tempted to say to almost all works of travel, in the character of its illustrations, which, in a wholly exceptional way, give expression to the finer elements of photographic art and to an unusually skilful use of the brush. To the geographer and geologist the lavish use of photographic material will make a special appeal, nor can readers not directly interested in polar matters fail to be struck with it. In our necessarily restricted space justice cannot be done to a narrative which covers such a range of achievement and of speculative conclusion. To have penetrated to the high southing of latitude 82° 17′ S., or nearly 250 miles nearer to the South Pole than had been attained by any previous explorer, would of itself have entitled the commander of the expedition to the fullest recognition on the part of geographical societies; but to this greatest triumph he adds the hardly minor achievements of long-continued exploration on the great ice plateau of 8,000-9,000 feet elevation which, with singular uniformity and seemingly endless expanse, continues Victoria Land (or South Victoria, as it is now termed) westward of the lofty Admiralty and Albert chains of mountains; of a virtually complete survey of the Ross Barrier to where it abuts upon the new King Edward VII. Land; and of a reconnaissance of the easternmost portion of what had hitherto appeared upon most charts under the name of Wilkes Land, and which is now shown (in the part surveyed) to be sea-ice and water. The

intensity of this exploration can be judged from the fact that two surveying parties were in the field with the temperature registering below —70°.

What will probably be considered the most interesting outcome of the expedition is the determination that the vast ice mass, the Great Antarctic or Ross Barrier, which bounds Ross Sea on the south, and has by nearly all geographers and geologists been thought to represent either the front edge or the lateral margin of a vast continental glacier sweeping down from an interior height of land, speculatively figured by some authorities to rise possibly to 30,000 feet, is in reality a vast flat plain, with practically no rise to the interior. It was on this plain, so little undulating as to permit objects a few feet in elevation to be continuously observed for many weary miles of travel, that the long journey to the south was accomplished. Its remarkable condition, wholly unsuspected in the preliminary survey, coupled with the significant fact that it is bordered (on one side, at least) by a clearly marked-out land mass of lofty mountains trending in a definite (north and south) direction, has suggested to Capt. Scott the entirely plausible conclusion that the barrier so-called is merely an ice-charged or frozen sea-surface, which rests on water of considerable depth and closely follows southward the border of a continental area. This conclusion, however widely divergent it may be from the views heretofore held, has at least the merit of many supporting facts, not the least important of which are the recession of the ice-front by many miles since the days of Ross, and the disclosure in its ancient position of fairly deep water. The lofty mountain chain or chains of Victoria Land, moreover, whose ice-caps tower to 12,000 and 15,000 feet (Mounts Markham, Lister, etc.), were observed to continue the general features of the land-surface far beyond the furthest point reached by the expedition; and their direct meridional trend has even suggested to the author the possibility or even probability of a continuity (extending over the pole) with the mountains of Graham Land and with the shattered mass of the Chilean Andes lying northward of this island.

The journey on the Hinterland of the Ross Barrier was accomplished with great difficulty, and with the virtual complete destruction of the suffering dog-teams. Progress was restricted to a daily advance of some six to eight miles, although the traverse was effected over a low terrain and with the advantages of a markedly genial and seemingly not too high temperature. A comparison with Mr. Peary's famous 1,300-mile journey, twice accomplished, over the inland ice of Greenland, at elevations reaching to 8,000 feet and more, is entirely in favor of the American commander, and one marvels, while rejoicing in the extraordinary resolution and energy displayed by its leader, that the British expedition should have been so deficient in its appreciation of the conditions and contingencies of ice-travel, and reckless in regard to its food-supply, as the narrative of this portion of its activities plainly shows it to have been. The incapacitation of the dog-teams almost from the day of starting, the reduction of the members of the expeditionary force to such a condition that even the commander (as he himself naïvely states) was hardly able to interest himself beyond the weary details of the daily trials and the hopes of the morrow, and the outbreak of incipient scurvy, are hardly the lessons that should have been learned from the Greenland expeditions extending back to the year 1901.

One conclusion reached by Capt. Scott from the study of the glacial and climatic conditions of Victoria Land cannot fail to interest the geologist and climatologist alike. In the far south, as in the far north, evidence points clearly to a former more extended development of the snow and ice-cap, and to a considerable protrusion of the ancient glaciers beyond the present limits. Many of the latter now stop at considerable distances from the shore-border, and glacial markings of one kind or another, including the presence of high-level morainic material, plainly indicate a former thickness of the glacial tongues exceeding by thousands of feet the measure of what remains to-day. This recession and shrinkage of the ice, in the light of the diminished precipitation which characterizes this region of extreme cold, is considered by the author to afford proof of a general lowering of temperatures, rather than the reverse—and this view accords with that of the minor body of glacialists who have persistently insisted that the cause of the Great Ice Age was to be sought in the conditions associated with a warmer, rather than a colder, climate. The feeble ice-covering seen on many of the mountain summits of Greenland and Grant Land would also seem to give force to this view.

Captain Scott's work dispels many erroneous notions regarding the physical conditions that prevail in the south-polar tract, which, except in its deficiency of plant and animal life, stand somewhat more nearly on the plane of the regions of the far north. Especially noteworthy is the statement bearing upon prevalent exaggerated ideas regarding the size of the antarctic bergs. Of the chapters by the commander's associates on geology, meteorology and other branches of investigation, some will doubtless be elaborated into more complete monographs. Space forbids particular mention of the many interesting and important contributions which these faithful lieutenants have culled from their own special fields of observation, but we will single out a special study of the Emperor penguin; and we cannot close this review without referring to an extraordinary animal trait, perhaps as curious as any recorded in the domain of zoölogy—namely, the habit that some seals have, on the eve of death, of dragging their bodies to a distance of fifty miles or more over the inland ice, and to mountain heights of 5,000 feet.

WIGMORE'S EVIDENCE.

A *Treatise on the System of Evidence in Trials at Common Law;* Including the Statutes and Judicial Decisions of all Jurisdictions of the United States. By John Henry Wigmore. In four volumes. Boston: Little, Brown & Co.

These volumes, dedicated to the "memory of Charles Doe of New Hampshire, Judge and Reformer, and James Bradley Thayer of Massachusetts, historian and teacher," will no doubt for a long time to come be for the United States a standard treatise on Evidence. A work which not merely cites thirty thousand decided cases and some twenty-five hundred statutes, but reviews the whole field in the light of all the research and analysis devoted to it in the last hundred years by some of the acutest legal minds of England and America, is a monument of learning and industry which is sure of its reward. It must be studied and it must be used. But, more than this, Mr. Wigmore's work is also original, and is to be compared and tested only by comparison with that of the great writers on Evidence—Greenleaf, Thayer, Stephen, and Bentham.

Mr. Wigmore's effort has been (to state it in his own words) to search out and emphasize "the accepted reasons for each rule" of evidence, to sift and arrange the mass of precedents "as a consistent product of these principles and rules," and to furnish the materials for ascertaining the present state of the law in every one of the American jurisdictions. In expounding the Law of Evidence throughout as a system, he has endeavored to complete the work begun by Thayer. Speaking of the investigations of that writer, he says (p. xii.):

> "As rules directly appurtenant to jury trial, he made clear their development down to the 1600s, when the common-law system definitely obtained the upper-hand of its rival, the canon-law system; and some of the rules he brought down to the present day. It was a part of the aim in this work to fill out the missing places, accepting the results already reached by him. Portions of this remaining history, as here set forth, had been seen and accepted by him."

It must be confessed that Mr. Wigmore's arrangement of the topics dealt with is at first sight rather confused by the employment of a terminology to which we are not accustomed. Thus, in Part I., under Relevancy, we find that title ii. (consisting of twenty-one chapters) has to do with "Testimonial Evidence," and title iii. with "Autoptic Proference" (real evidence). Testimonial is commonly called Direct, and is opposed to circumstantial evidence. It is brought here under the head of Relevancy, on the ground (§ 475) that the question whether A's assertion that B forged a note *can be received to prove that B forged it*, is one of relevancy. We hesitate to say that Mr. Wigmore is wrong; but most people would hold that a statement by A that he saw B forge a note was direct evidence of forgery. The term Relevancy, as generally used, imports an inference from some piece of evidence to a fact in issue. We may say that an assertion like that given is relevant to the question of the truth of the fact, but have we advanced matters by saying so? Is it not too broad a generalization to be useful as a basis for classification?

The subjects of the qualifications of witnesses and impeachment of witnesses come under the head of Relevancy, and are brought into the same division with Admissions, as is also a part of the law of direct and cross-examination (§ 768). Leaving Relevancy, we find ourselves in Part II. in the region of "Rules of Auxiliary Probative Policy." In other words, assuming that the principles of Relevancy, to which it has been seen Mr. Wigmore gives a wide scope, are satisfied, and that certain

facts, so far as concerns their logical bearing and probative value, have passed the gantlet, other rules are encountered. To any one not at home in Mr. Wigmore's system, it will be a surprise to learn that the rules are divisible into five great classes, which he terms, respectively, Preferential, Analytic (or Scrutinative), Prophylactic, Simplificative, and Quantitative (or Synthetic). Preferential rules prefer one kind of evidence to another, though both are relevant—*e. g.*, the rule that calls primarily for the document itself rather than for testimony about its contents. Of analytic rules there is, in effect, but one—that which declares that hearsay is no evidence; prophylactic rules are those which prescribe expedients to remove sources of danger to testimony—the oath, the penalty for perjury, publicity of proceedings, separation of witnesses, and prior notice of evidence. Simplificative rules exclude evidence absolutely or conditionally, as in the case of evidence offered at an improper time, testimony merely cumulative, etc. Quantitative rules are such as prescribe a definite number of witnesses as a minimum (*e. g.*, on a charge of treason) or corroboration of some sort; of these there are very few in our system. Covering some of these rules is the "Best Evidence" principle, which, however, is more usually found as an alternative form of the rule calling primarily for the document itself. It has also often been employed to designate the Hearsay rule.

Part III. deals with rules of Extrinsic Policy, which are, first, rules of absolute exclusion, *e. g.*, for indecency, impropriety, or inconvenience; second, rules of optional exclusion (privilege and privileged communications). Part IV. treats of the Parol Evidence rules (an exhaustive and original monograph), burden of proof, presumptions, judicial notice, etc.

From this brief summary it will be seen that Mr. Wigmore has taken the whole law of Evidence to pieces, and put it together again in his own way, while the novelty of his arrangement is emphasized by a peculiar terminology, which is objectionable as not being that of the courts. His achievement is that he has produced a systematic treatise in which decisions and statutes are coördinated in a rational, probative scheme, this scheme embodying the English and American Law of Evidence. This has never been done before. Perhaps it never could have been done until the modern reformed procedure had disintegrated the old common-law system, and until modern research had made plain the historical development of this branch of jurisprudence.

Good examples of Mr. Wigmore's method are naturally furnished in his treatment of the Hearsay and the Parol Evidence rules. The former he treats (§1362) as being fundamentally a rule requiring the rejection of testimony not subjected to cross-examination. That the objection to it is not due to its being the testimony of a person not sworn, is shown by the fact that ex-parte affidavits are obnoxious to the rule; and that when hearsay evidence is permitted (§1422)—*i. e.*, where statements not subjected to cross-examination are received—it is not held necessary that they should have been made under oath. Confrontation is necessary because cross-examination is necessary (§1364)—it has the advantage of enabling the tribunal to observe the witnesses' demeanor on the stand; but this may be dispensed with when it is not possible. The Hearsay rule is only about two hundred years old; it is part of our modern system of jury trial.

The Parol Evidence rule is analyzed into something very different from what it used to be. That parol evidence is not admissible *to contradict or vary the terms of a valid written instrument*, is, in Mr. Wigmore's system, not a rule of evidence at all, because it does not concern a "probative mental process" (§ 2400 *et seq.*), nor exclude data as untrustworthy or undesirable means of evidence. As restated by him (§ 2425), it seems to be that "when a legal act is reduced into a single memorial, all other utterances of the parties on that topic are legally immaterial for the purpose of determining what are the terms of their act." This Mr. Wigmore treats as a rule of substantive law, and maintains that it has no necessary relation to any rule of law requiring acts to be put into writing, but would apply equally to an act embodied in oral form. The rule is then resolved into rules of substantive law dealing with acts, in four different aspects: the Creation of the act, its Integration, or embodiment in a single memorial; its Solemnization; and its Interpretation.

That Mr. Wigmore's treatise, based as it is on Thayer's investigations, is a veritable monument of analysis, it is unnecessary to repeat. Whether it is final or not, we will not undertake to say; at any rate, it marks the latest stage in a critical movement of the first order, which for more than a hundred years has had for its object the rationalization of the English law of evidence. Its results, many of them made efficient by reformatory legislation, have been two-fold; the old abuses of the law—*e. g.*, the exclusion of the testimony of parties in interest—have been swept away; and the law relating to the admission of all relevant evidence has been simplified and put on solid ground. But in this country other abuses have sprung up—Mr. Wigmore is, we believe, the first writer to call attention to them—which make the present law of evidence not a simple body of probative rules, but a tangled wilderness of cases, the mass of which is ever increasing, and through which analysis throws only a glimmering light on the path. The reason why we cannot understand the Law of Evidence without the aid of such profound analysis as Mr. Wigmore's, is because of the extraordinary multiplicity of cases by which its principles are obscured; and this grows out of a theory of judicial error and new trials which is wholly modern, which has been abandoned in England, and which, were it swept away here, would probably in fifty years effect as great a reform as any of Bentham's or Romilly's. The rule that there must be a new trial whenever it appears that evidence wrongly excluded might by possibility have affected the verdict, or vice-versa, makes it for the interest of every litigant to multiply exceptions to evidence. His stake is a new trial; his cards are the "rules of evidence"; and he is an unskilful advocate if he cannot contrive in the course of a case to get some rulings from a judge which, when passed upon by the appellate court, will swell the *corpus juris* of evidence. This is all unnecessary, and in England has been swept away by going back to the old rule that the erroneous admission or rejection of evidence was not sufficient ground for a new trial unless it appeared that the truth had not been reached. In England "there now occur annually not more than five rulings upon points of evidence, as against more than five hundred in the reports of the United States"—"and that in a community almost half as populous as ours, but more than twice as litigious." Of course, in any such comparison, it will not do to overlook the fact that there are some fifty courts of last resort in the United States; but this, again, only makes the necessity of the reform more urgent.

THE FASHION OF A DAY.

Kate Greenaway. By M. H. Spielmann and G. S. Layard. London: A. & C. Black; New York: G. P. Putnam's Sons. 1905.

The life of the artist whose delightful illustrations of children's books endeared her to two hemispheres is here admirably told. Innumerable pen-and-ink illustrations intersperse the text, many of them from Miss Greenaway's letters to John Ruskin, her friendship with whom was one of the important features of her life. The full-page illustrations have been done with particular care by the three-color process from hitherto unpublished work, *i. e.*, her water-color pictures sold out of the exhibitions or executed for presentation to friends. They have been especially well chosen and give a very adequate idea of her art, which she devoted to the graces of childhood and all the incidents that make the joys and interests of child life—gardens, flowers, toys, country cottages, village streets, and dainty interiors. Miss Greenaway also introduced a new fashion in children's costume. She dressed the children in her toy books in a modified form of what was worn at the close of the eighteenth century, and the admiration and enthusiasm these books received led to the clothes being copied for the children for whom the books were intended.

Kate Greenaway was born in 1846, at Hoxton. Her father was a prominent wood engraver and draughtsman who worked for *Punch* and the *Illustrated London News*. Her early years were uneventful, and are told from her own reminiscences, written a few years before her death. When she was quite a child, her father, through the failure of the publishers who had employed him to illustrate an important work, had to restrict the family expenses very considerably. They moved from Hoxton to Upper St. Islington, where Mrs. Greenaway, her mother, set up a shop for children's dresses, lace, and fancy goods. Their new home was a portion of an old Elizabethan country house in a very dilapidated condition, with rambling passages and certain rooms fallen into uninhabitable disrepair. These surroundings were well adapted to stimulate the fancy of the precocious child. Kate Greenaway went to a dame's school near by, where she learned to read and to sew from an old lady in a large frilly cap, a muslin dress, a scarf over her shoulders, and a long apron; the image of this lady lives on in her il-

lustrations. Her capacity for enjoyment and power of observation must always have been remarkable. She says of those early years: "I suppose my imaginary life made me one long continuous joy—filled everything with a strange wonder and beauty. There was always something more—behind and beyond everything—to me; the golden spectacles were very very big." They served her well in later years to see the beauty and poetry in scenes of everyday occurrence; but this great joyousness had its natural reaction in fits of gloom and depression.

It was at the age of twelve that Kate Greenaway showed her tendency for drawing, at the time of the Indian mutiny, when all England was stirred by the terrible events then taking place; the terror of Sepoys, and the excitement of people escaping, filled the child's brain and found expression on her slate at any leisure moment. Her parents recognized this budding aptitude, and sent her to an art class in Clerkenwell. In that same year she carried off a prize, and showed such unmistakable talent that her profession as an artist was determined, and she joined the chief school of the art department under Mr. Burchett, who from the first formed the highest expectations of her talent. She worked for several years with great diligence at South Kensington, and at the same time attended the life classes at Heatherley's, and later on she studied at the newly opened Slade School under Professor Legros. It was in 1868 that Miss Greenaway first exhibited works, at the Dudley Gallery. "Six little drawings on wood" attracted the attention of a discriminating editor, the Rev. W. J. Loftie, who secured the same for two guineas, published them in his *People's Magazine*, made the acquaintance of the artist, and procured her work in artistic Christmas cards and valentines in gold and colors, for the firm of Marcus Ward of Belfast, then a new departure. Miss Greenaway seems not to have been naturally gifted for color designing; her subsequent success in that especial line was due to her incessant study of old masters at the National Gallery and of mediæval illumination.

Her first great success was a valentine, of which 25,000 copies were sold in a few weeks, her part of the profits amounting to £3 only. On these same terms she continued to furnish many designs, improving all the while as she found out the capabilities of color printing, very restricted in those days, and her own developing talent for invention. Many of these were subsequently reprinted in a volume, together with designs of Walter Crane for the same firm, entitled 'The Quiver of Love: A Collection of Valentines, Ancient and Modern' (1876). Her connection with the Marcus Ward Co. ended after six or seven years; and then Mr. Edmund Evans went into partnership with Miss Greenaway for the production of her books. This was an especially happy arrangement, for Mr. Evans excelled above all others in his skill in producing color effects with a small number of printings, owing to his ingenuity, excellent taste and complete accuracy. He had already been publishing the toy books of Walter Crane and those of Randolph Caldecott when he arranged to undertake Kate Greenaway's designs; he had known her father since his earliest years. Mr. and Mrs. Evans, who became her fast friends, both contribute their recollections of her to this volume. It was the publication of 'Under the Window,' in 1878, which brought her immediate fame; 70,000 copies of the English edition were sold, and 30,000 more in French and German. Here she displayed for the first time her double gift of verse and design together, emancipating herself from the need of adapting her work to express the ideas of others. We quote from her biographers:

"It must not be supposed that Kate had any illusions about her literary gifts, or that she placed her own productions on a par with those of others whose work she illustrated. But she preferred her liberty, and found her pencil better inspired by her own pen than by the pens of others with whom she was called on to collaborate. Other verses were obviously cleverer and daintier than hers, but her own simple thoughts were more in harmony with her delightful little pictures."

Frederick Locker and Austin Dobson thought well of her verses. The latter says concerning them: "She was very deficient in technique, but she had the root of the matter in her." And with reference to the pictures:

"Since Stothard, no one has given us such a clear-eyed, soft-faced, happy-hearted childhood, or so poetically 'apprehended' the coy reticences, the simplicities, and the small solemnities of little people. Added to this, the old-world costumes in which she usually elects to clothe her characters lend an arch piquancy of contrast to their innocent rites and ceremonies. Her taste in tinting, too, is very sweet and spring-like; and there is a fresh, pure fragrance about all her pictures as of new-gathered nosegays."

Mr. Ruskin, with characteristic enthusiasm, devoted one of his Oxford lectures to the place Miss Greenaway held in art. Stacy Marks had always been a trustworthy friend and helpful critic; it was through him that Kate Greenaway first knew Ruskin. He wrote to her in 1880, but not till two years later did they meet. Ruskin very justly counselled her from his first letters to study nature, to draw from the nude, to strive for more accuracy and fuller color. These admonitions run through the whole correspondence, and very much annoyed he seemed at times that she did not pay much attention to his advice, but tranquilly pursued her own course. His praise is often excessive, but Ruskin always delighted in extremes of praise and blame in criticising the works of those who came under his influence. He writes of a Christmas card Miss Greenaway sends him: "To my mind it is a greater thing than Raphael's St. Cecilia"; and again, about another drawing: "This is quite the most beautiful and delightful drawing you've ever given me, and I accept it with the more joy that it shows me all your powers are in the utmost fineness and fulness, and that you are steadily gaining in all that is best—and indeed will do many things—Heaven sparing you and keeping your heart in peace—more than have ever yet been seen in all human dreams."

Here we must give an example of his blame in return for one of her Almanacs: "You are working at present wholly in vain. There is no joy, and very, very little interest in any of these flower-book subjects, and they look as if you had nothing to paint them with but starch and camomile tea." Inexpressibly touching are Miss Greenaway's constant letters to Ruskin during his years of suffering, in which she tells him all she can think of to interest him, with infinite tenderness and spontaneity filling her paper with delightful pen drawings wonderfully expressive in their simplicity and directness of execution.

Hers was a beautiful nature, which no success could spoil; a true artist, loving her work and seeking always to attain a high ideal. Her popularity for a time was almost unparalleled, her books being constantly in demand. But she made innumerable designs for various purposes, and was a constant exhibitor in the yearly picture shows, where her watercolors sold well. Then came a sudden change. Art in England is entirely a matter of fashion, which affects the Academy picture as much as the child's book of colored prints. The publishers found that Miss Greenaway's work was no longer in demand, and she had to consider some other branch of art as a means of livelihood. She was turning her attention to acquiring facility in oil painting with a view to portraiture, when her health failed. The last book she illustrated was 'The April Baby's Book of Tunes,' for the author of 'Elizabeth and her German Garden.' Various schemes were proposed to her which she did not feel strong enough to undertake—one of these the editorship of a new magazine for children. Another plan she had for a great dressmaking business, for which she was to be designer; another, for making decorative reliefs in gesso. During these last years Kate Greenaway occupied herself frequently with expressing her feelings in verse. We are told that she attributed to being "a quarter Welsh" the melancholy side of her nature and her passion for writing of unrequited love, imagining some love-lorn lady appealing to a heartless swain who too late relents. The poems given are for the most part unfinished sketches of her intentions. One little one, relating to her own case of having her work set aside by the world while her imitators were continuing on her lines, we must quote, for it expresses well her disappointment courageously borne:

"Deserted, cast away, my work all done,
Who was a star that shone a little while,
But fallen now and all its brightness gone—
A victim of this world's brief fickle smile;
Poor fool and vain, grieve not for what is lost,
Nor rend thy heart by counting up the cost."

Kate Greenaway died in 1901, and her friends, as a fitting memorial to this happy delineator of childhood, endowed a cot in her name in the Great Ormond Street Hospital for Sick Children. A dedication plate, specially designed, affixed to the wall, reminds inquirers of one who, in spite of suffering and physical weakness, brought delight and happiness into the lives of others.

MAGNA CARTA.

Magna Carta: A Commentary on the Great Charter of King John. With an Historical Introduction. By William Sharp McKechnie. Glasgow: James MacLehose & Sons; New York: The Macmillan Co. 1905.

It is a singular fact that not until now has Magna Carta been made the subject of a notable monograph. Every writer on

English history vouchsafes remarks regarding this great document, but, even when not of a rhetorical character, they are too often a mere abstract of terms or a tirade against John's iniquities. "Magna Carta," one man of genius said, "if it did not give us originally the House of Commons, gave us at least a House of Commons of weight and consequence." When Burke perpetrates such an amazing blunder as this, the average person, despite all the text-books of the past hundred years, may be credited with remaining somewhat in a haze as to what happened at Runnymede. The constitutional historians themselves have done a vast amount of talking round the subject, or have taken more knowledge for granted than is possessed save by the specialist. Stubbs, who was better qualified to give judgment than any one else of his generation, said that "the whole of the constitutional history of England is little more than a commentary upon Magna Carta"; but, though he edited a carefully revised text, he never took the charter up as an isolated theme, and doubtless many students besides Professor Prothero have deemed it impossible "to throw any new light on a subject exhausted by the ablest writers."

Dr. McKechnie, moved by the neglect to which we have just referred, comes forward with a book of nearly 600 pages, wherein he examines both the crisis of 1215 and the sixty-three sections of the famous agreement. He is not, however, the only historian in Great Britain to be agitated at the present moment by the Great Charter. In November, 1904, Mr. Edward Jenks attacked one of our most splendid traditions by an article in the *Independent Review*. Styling his paper "The Myth of Magna Carta," he not only denounced the selfishness of the barons and their lack of statesmanship, but maintained that the historical importance of the Charter has, since the days of Sir Edward Coke, been ridiculously exaggerated. When once the point has been raised, it matters a good deal whether we regard this document as feudal and reactionary in character, or continue to deem it the corner-stone of the whole constitutional fabric.

Dr. McKechnie is at one with Mr. Jenks in being able to see defects, but on the whole his criticism is far less radical. Obviously, the barons showed want of foresight when making provision for the enforcement of the terms they exacted. If the King were deemed guilty of infringing the Charter, the body of barons was authorized to appoint a committee of twenty-five in whom resided executive powers, both for negotiation with the King through a sub-committee of four, and for the declaration of formal war if the King would not keep his promise. How absolutely futile such machinery was bound to be we can see at this length of time, but when we consider the solidarity of feeling which for the moment existed in 1215, it is by no means difficult to understand why a scheme for controlling the Crown through a committee of the baronage should have appeared feasible. A more glaring weakness of the Charter is its failure to enlarge and endow with wider powers the *Commune Concilium*. The Council is not given any legislative functions nor is its status enhanced at any single point. To ratify or veto a schedule of feudal dues which is drafted by the King or his personal advisers seems to be its main privilege, while the veto it possesses can affect only a very limited class of exactions. These shortcomings Dr. McKechnie sees, and he also admits that in general the barons were unable to devise practical remedies for specific evils. Thus, for example, "when John promised in chapter 16 that no one should be compelled to do greater service than had been formerly due from any holding, no attempt was made, in case of dispute, to provide constitutional machinery to define what such service actually was; while chapter 45, providing that only men who knew the law and meant to keep it should be made justiciars, sheriffs, or bailiffs, laid down no criterion of fitness, and contained no suggestion of any way in which so laudable an ambition might be realized."

Dr. McKechnie is very guarded when expressing an opinion of a controversial character, but it is clear that he parts company entirely with Mr. Jenks when we pass from particular defects to the broad significance of the Charter. "The praise, justly earned by its framers, for the care and precision with which they defined a long list of the more crying abuses, must be qualified in view of the failure to provide procedure to prevent their recurrence." This, we should say, is Dr. McKechnie's heaviest indictment against the barons, and it is a long way from constituting an agreement with the view that Macaulay and Green, Stubbs and Maitland, besides the rest of the world, have been all wrong in identifying the barons' resistance and its fruit with a long step forward towards constitutional freedom. We discuss this point at some length because Dr. McKechnie is more willing to see flaws in the Charter than most commentators have been, while yet he is unwilling to join Mr. Jenks in denouncing the document as a poor thing.

Considered with regard to structure, this extensive treatise falls naturally into a general historical introduction and a commentary on the text. The events leading to Magna Carta are in essential respects familiar to all historians, nor is Dr. McKechnie on very new ground when dealing with feudal grievances. It is when he takes up the form and contents of the Great Charter that he comes to close terms with his subject. This latter part of the general introduction clears a way for the detailed commentary, which occupies about two-thirds of the volume, and is, for special students, its most valuable portion. Modern commentators have agreed to take over the sixty-three sections into which the Charter was divided by its original framers, and for each of these Dr. McKechnie has a corresponding chapter of comment. Text, translation, and glossary being brought together most conveniently, the reader has placed before him all the aids to interpretation which he can well desire.

As an example of the method followed, we shall single out sections thirty-nine and forty. Herein, according to a widely accepted view, will be found the vital paragraphs of the document. Whereas almost all the provisions refer to particular abuses arising out of the feudal relation, we seem to reach in sections thirty-nine and forty something that resembles a broad statement. No free man, says the King, shall be in any way molested save by the lawful judgment of his peers and by the law of the land. And, moreover, "to no one will we sell, to no one will we refuse or delay, right or justice." Section thirty-nine, of which the complete text can be printed in four lines, Dr. McKechnie makes a subject for nearly fifteen pages of compact and important comment. "This chapter," he begins, "occupies a prominent place in law-books, and is of considerable importance, although there are reasons for holding that its value has been grossly exaggerated." Under the ordinary legal interpretation of the past three centuries, the safeguard to the liberty of the subject which is provided by the phrase "lawful judgment of his peers" has been made to mean a trial by jury. "A promise of law and liberty and good government to every one" has even been found to lurk beneath the ample language of section thirty-nine. Dr. McKechnie, however, is convinced from the categorical nature of the demands made in other portions of the Charter that the last thing that the barons had in mind was the erection of an abstract principle. The clause, on close examination, really contains a special reference, and is not by any means the high-sounding platitude it appears to be at first sight. Judgment, the barons declare, must precede execution, and the clause glances at a specified abuse, namely, the packing of a tribunal by royal nominees. Even a sweeping allusion to "the law of the land" may be said to possess a specific meaning, since under it every freeman shall have a chance before judgment goes against him of proving his innocence by the law of battle or of ordeal unless some other procedure is prescribed for the case. Every one who has made the acquaintance of mediæval documents must realize how seldom an aggrieved magnate stops to discuss an academic proposition. Very probably the phrasing of section thirty-nine may, through its very looseness, have had some effect upon the shaping of political thought in England by giving radicals some standing-ground. But, with Dr. McKechnie, we must hold that the words in the first instance contained a direct and especial reference.

Were we able to do so, we should gladly touch upon other points which illustrate the style of treatment that is pursued in this elaborate commentary. As it is, we must conclude by styling Dr. McKechnie's work the most detailed and satisfactory examination of Magna Carta.

Grand Feu Ceramics: A Practical Treatise on the Making of Fine Porcelain and Grès. By Taxile Doat, of the Manufactory of Sèvres, France. From the French by Samuel E. Robineau. With numerous illustrations; and notes on the use of American clays for Porcelain and Grès by Prof. Charles F. Binns of the School of Ceramics, Alfred, New York. Syracuse, N. Y.: Keramic Studio Publishing Company. 1905. Pp. 207.

The author of this book is one of the artists employed in the Great National Manufactory of porcelain and other ceramic wares at Sèvres, Near Paris, to the westward, and on the left bank of the Seine, well within reach of the residence part of

the city by ordinary street carriage or by tram-cars going frequently, there is yet about the little town a certain aspect of antique gravity; and the buildings of the manufactory itself retain all of that regular ordonnance which one would expect of a great French national institution. The long buildings stand parallel to the high road, and attract the eyes of visitors; and behind or beside them stand smaller pavilions which are inhabited by the chief employees, all sheltered by great trees. For very many years this great manufactory had been identified with porcelain, in the strict sense of that word, with porcelain alone; but a new administration was organized during the last decade of the nineteenth century, and, very soon after the new officers had taken their places, the scope of the manufactory was enlarged in various directions. Of these expansions of its business, most interesting to artists are the employment of first-rate sculptors for the modelling of figures for reproduction in biscuit or in glaze and finished porcelain; a more general calling in of painters of merit, no longer to paint copies of pictures by Boucher upon vases, but to design abstract, purely decorative patterns and sprays of flowers treated severely; and, most important of all, the making of hard stoneware for architectural uses—architectural members carried out in this most permanent of ceramic wares, to which, by a new process, are given colored glazes. This last extraordinary new departure may not be entirely based upon new discoveries, though it is largely so based. It is probable that stoneware had been prepared with opaque colored glazes even before the nineteenth century; but to undertake it on a great scale and with the deliberate purpose of imitating in their brilliant colors the "majolica" crestings and crownings and bossed ornaments of the Renaissance, in a material of vastly greater endurance, was an achievement worthy of a national institution.

Some part of all this advance, artistical and industrial, was made evident by the Paris Exposition of 1900, where the display of the Sèvres manufactory was attractive and splendid, occupying a large pavilion of the main building on the Esplanade of the Invalides, and having in addition several larger exhibits in the open air under the trees of the different parks, or encrusted in the walls of the more permanent buildings of the Exposition. The chief of these was that extraordinary frieze in the wall behind the colonnade of the Greater Palace on the north side of the Seine. Concerning this display, much more might be said but that a sufficiently representative volume embodies it, to wit, that in small folio, bearing the name as chief author of E. Baumgart, the administrator of the Sèvres manufactory. Among the plates of this volume are vases adorned by Mr. Taxile Doat, the author of the book which we have undertaken to review; but it is not as designer that we have to do with Mr. Doat, for his book deserves and requires all the attention which we can possibly give to it and to him as historian and critic.

The first chapter of 'Grand Feu Ceramics' is devoted to the present ceramic movement in Europe, the second to the Sèvres exposition of 1900, and the third to the organization of the manufactory—together forming Part One, and filling about fifty pages. Part Two, next, with 120 pages, is divided into eleven chapters, and is devoted entirely to "Technical Instruction in the Making of Grand Feu Porcelain and Grès." And this seems to be the place to explain that by "Grand Feu" porcelain is meant that which bears the very great heat of the special porcelain furnace—a heat beyond that which Chinese porcelain (for instance) would bear. By "Grès" (printed in the most prominent place by some accident without the accent) is meant stoneware, familiar to all of us by its presence in ink-bottles, vinegar-jugs, and like articles, which must be non-absorbent and strong, and which is artistically famous for the splendid ware which we used to call Grès de Flandres, but now, more sensibly, Cologne ware, or simply Rhenish stoneware. Examination of the text discovers to the reader a very thorough treatise on the preparation of the paste, the casting, the glazing, the preparation for firing, the use of saggers (pottery boxes for holding the pieces of more delicate ware), and the painting of the ware with those few colors which can endure the heat of the furnace.

Finally, at the close of the book, a quite independent essay is printed. This is the treatise on the American clays, by Professor Binns, and it is divided into two papers, appropriated severally to the clays that are fit for porcelain and to those which are used for stoneware. It would seem that the presence of this essay is due to the publication of the volume by the owners and publishers of a journal called the *Keramic Studio*, in whose columns the several papers have appeared. The accompanying six half-tone illustrations from porcelain vases and platters made by Mrs. A. Alsop Robineau are explained by a note at page 190. It appears that these pieces are the result of experiments made during the publication of Mr. Doat's papers in periodical form. We are in the presence, then, of a book owing its existence to four persons, Mr. Doat, Mr. and Mrs. Robineau, and Professor Binns; and it is with no disfavor that we observe the alliance of several persons in the production of a treatise which must be of great value to the few American manufacturers and the many American collectors of delicate wares. One would be glad to see Professor Binns's essay enlarged and made to present specimens of other porcelains than those produced by one maker.

The illustrations of the chief essay are numerous, and many of them appear again after their presentation in the Sèvres folio of which we have spoken. Not all of these are the work of Mr. Doat. The great frieze of the Grand Palais was modelled by Barrias, nor does Mr. Doat's name appear among those who have worked upon it. The admirable Dancers modelled for table decoration by Léonard are given at page 33 as by one Leonard, without accent; the magnificent specimen of the intended pavilion for the Sèvres manufactory (to produce which complete there was not time enough) is the design of Mr. Risler, while the sculptures are by Messrs. Coutan and Corbel. This piece of decorated wall and window work and the admirable rondel signed by J. Coutan are to be found on pages 30 and 31. It will be seen, accordingly, that the book would have interest and value even apart from its primary merit as a thoughtful study and as a piece of technical instruction. But in these ways, too, it is valuable. Illustrations are used with great judgment, now in the form of outline diagrams, showing how a kiln is built and how the pieces are placed in it; again in the form of half-tone plates, showing how a bust (for instance) shrinks from its unfired condition by perhaps ten per cent. when it is first baked, and then fifteen per cent. more when it is fired with the great heat of the porcelain furnace (p. 121). There are added to the technical chapters various recipes and formulæ for the making of pastes and colored glazes.

Memoir of Colonel Henry Lee. With Selections from his Writings and Speeches, Prepared by John T. Morse, Jr. Boston: Little, Brown & Co. 1905.

It seems very appropriate that just when the grateful professors and tutors of Harvard University are gathering around Bishop Lawrence to express their gratitude for his successful labors in getting their salaries increased, there should appear in print the memorial of the daring originator of this and many another good project, Colonel Henry Lee of Boston. It would not be fair to say that Boston lost in him the last of its wits or of its millionaires, but it is safe to predict that it will be long before one will appear who can rival him in the combination of these two characters.

A mere glance at the portrait which introduces the volume will confirm this characterization in the eyes of those who never saw the man, and the memoir itself removes the fear which has been felt lest this rare combination of character might pass from memory through not being embodied in type. It is true that Harvard Memorial Hall, which Colonel Lee mainly planned and carried through, and to which he contributed the final twenty thousand dollars necessary for its completion, will stand as his lasting memorial; but the impulse, the independence, the wit, the daring of his character would have disappeared amid the vast miscellaneousness of the Boston daily press, had not a younger kinsman been luckily persuaded to preserve some lasting memorial.

Colonel Lee once said of himself at a meeting of the Harvard Overseers: "I offer to the President my purse and my advice, and I am reminded of the two women grinding at the mill—'The one shall be taken and the other left.'" The same might have been said with equal appropriateness during the Civil War, when he was chief of staff to Governor Andrew and had to struggle against General Butler on the one side, and what Lee himself describes as "the wise but maddening slowness" of President Lincoln (p. 256). He derived his military title only from his position on the Governor's staff at that period; but such service as he rendered counted for more than a hundred military titles may represent in time of peace, and his judgment, penetration, and fearless independence justified the claim. His biographer says well of him that "his bearing was simple, but very distinguished. No one ever looked more fully the gentleman, and his manners were those of the born aristocrat—unaffected, but of a certain courtliness—what is commonly described as of the 'old school,' . . . 'an English

gentleman in America,' as used also to be said of George Washington" (p. 216). It was Colonel Lee himself who also said: "Mr. [Wendell] Phillips is above all things an aristocrat." Lee was for many years the leading Bostonian, in this sense, that his biographer may well say of him, "as in the case of Miltiades, many individuals (or their friends for them) might have put their own names first, but each would have put Colonel Lee's name second" (p. 155). He also adds: "Sir Walter Scott said that if in any year he could not set his foot upon the heather, he should die; Mr. Lee might not have been quite willing to say that if he could not very regularly see the dome of the State House, he should die, but those who knew him would have said it for him" (p. 151).

He was "born with a terrible propensity for truth; a propensity to which he yielded until it became a passion that completely mastered him." His powers of description and characterization were unsurpassed in his day, and they were as telling when applied to a hand-cart man as to the reigning queen of Boston society, whoever she might be. When one of his young friends was engaged to be married, he said: "Get on your horse to-morrow morning and ride with me, and I will tell you all about the ancestors of your intended; you ought to know such things, and no one else can tell you so well as I can," and he fulfilled his promise (p. 164). When the editor of the 'Harvard Memorial Biographies' obtained an hour's interview with him, he talked through the whole list of the seventy or eighty men whose lives were to be written, describing each man; and, perhaps, if he had to do with a Bostonian, jumping up and imitating the way the man's father would walk down State Street. At one time, when a vacancy was to be filled in the Corporation of Harvard University, he drew up on a small sheet of paper, a list of the different men proposed, and briefly characterized them in such terse verdicts as follows: E. Rockwood Hoar, "Hereditarily fond of the College; strong-minded; but too much like the present Fellows: would swear that black was white, if contraried." Richard H. Dana, jr.: "A happy faculty at making enemies." Edmund Quincy: "Spoiled a horn, but never made a spoon." John Lowell: "Very eligible—if an orphan" (three of his name having preceded him in the office). Francis Parkman: "Of uncertain judgment, but abundant firmness" (pp. 166-7). These are but few examples of the many. The same power of terse and independent characterization is to be seen in his obituary notices of contemporary Bostonians in the *Daily Advertiser*, and it is pleasant to observe some of the same vigor applied in the final summing up of his character by his nephew and namesake, Henry Lee Higginson. Of the selections given from the 'Writings and Speeches of Colonel Lee,' those relating to the local history of Boston may be to many readers, though they should not be, less interesting than the personal reminiscences of Governor Andrew, or Lee's speech at "the Shaw Memorial." In these we get, as hardly anywhere else, the actual spirit of the war, as, for instance, in the glimpses afforded of the difficulty, during the war period, of selecting suitable officers for regiments of utterly raw soldiers. With all his aristocratic prejudices, Lee tells us (what has been pointed out by others) that the best officers culled from the militia were obtained from the ranks, but that

"as a rule those high in rank were imposingly absurd. A bit of uniform, an unnaturally stiff carriage, and rectangular movements when off duty, were deemed soldierly characteristics, and supposed by many to denote a commander, especially if further emphasized by a hoarse voice and peremptory speech. . . . The only brigadier who entered the service [from Massachusetts] drove all his best officers out of the regiment which he mismanaged. One of the three major-generals, after bustling about aimlessly, sought a command, but soon sickened of his colonelcy and retired to the more congenial position of sutler" (pp. 241, 242).

Of foreign officers, who were supposed to be much favored in the Governor's sight, Mr. Lee reports thus: "One Prussian of undoubted experience and instruction was a sorehead, never contented; one of his countrymen studied his music instead of his battalion; one Italian was neglectful of his command, another proved dishonest; one German was a brave soldier, wounded badly at Ball's Bluff, eventually killed in battle, but was always jealous of his better-bred, better-educated brother officers—absurdly suspicious. But these were striking exceptions; men who by merit rose from the ranks earned their promotion and the warm regard of their comrades" (p. 245).

A lady once told Colonel Lee, as he tells us, "that the reason I didn't get along better with Governor Andrew was that he was a poet" (p. 254). To this his chief of staff gives ready acquiescence. "The Governor," he says, "was a mute poet of the Whittier type, a New Englander with all the instincts and tastes and attachments of a New Englander. So while he grew daily and his sway over all increased, he was, peculiarly, the idol of the plain people" (p. 254). At the same time, it was true that "he was in the habit of visiting New York and conferring with Southerners at the New York Hotel; had he lived, his mediation would have been important" (p. 260). We can recognize this importance more truly, perhaps, to-day than even at the time when Colonel Lee wrote it.

The Life of St. Patrick, and his Place in History. By J. B. Bury. Macmillan Co. 1905.

Most lives of St. Patrick have been written by ecclesiastics, or persons subject to ecclesiastical or theological bias. Professor Bury, an historian by practice and profession, with an interest purely intellectual in the subject, treats the life and times of St. Patrick as an episode in the history of Europe. Though Ireland never was part of the Roman Empire, it was part of the Roman world so far as the Roman world represented Christendom.

Christian communities existed in Ireland before St. Patrick's mission; and, apparently in compliance with a request from the Irish Christians, Palladius was appointed bishop and visited the island about 432 A. D. This was the first manifestation of the authority of Rome in Ireland, and Professor Bury thinks that the visit of Palladius was directed towards the correction of the Pelagian heresy rather than the conversion of the heathen.

While the whole subject is wrapped in obscurity and encircled by an atmosphere of uncertainty and conjecture, the main facts of Patrick's life can be eliminated from the mists of legend and tradition. The most credible sources of information regarding it are two works which there is every reason to believe were written by himself, (1) his so-called confession, or rather apology for and description of his work and calling; (2) his letter against Coroticus, a British chief who had raided a Christian Irish community. The first of these is preserved in a manuscript known as the *Codex Armachanus*, along with other Patrician documents, the work of an Armagh scribe, who died about 847 A. D. The second exists in several manuscripts of different dates. The genuineness of both documents appears unquestionable. The earliest extant document giving an account of Patrick's life is a memoir written in the second half of the seventh century by Tirechan, a Connaught bishop, its object being to set forth the circumstances of the foundations of communities of Patrician origin. There is also a life of Patrick by Muirchu, at the end of the seventh century, which follows Patrick's confession till he came to Ireland, and then enters a world beset with legends.

The facts deduced by Professor Bury from the material which he says had never been critically sifted, are, that Patrick was born about 389 A. D., probably in Glamorganshire, on the northern shore of the Bristol Channel. His father was a Roman citizen, a decurion, and a Christian deacon. Patrick was brought up in the knowledge of the Christian scriptures. At the age of seventeen he was carried off by Irish freebooters to the "ultimate places of the earth." His captors appear to have brought him to Wicklow, and he remained a slave, a herder of cattle and pigs for six years. According to the more common tradition and general belief, his place of sojourn was in County Antrim, but Professor Bury gives reasons for thinking that it was more probably in the province of Connaught. There, as his confession states, "daily herding cattle and lifting up my heart in aspiration many times a day, the fear of the eternal grew daily in me. . . . I often prayed a hundred times a day, and as many times in the night. I often remained in the woods and on the hills rising to pray while it was yet dark, in snow, or frost, or rain; yet I took no harm." Influenced, he says, by a dream, he escaped from his master, took ship at Wicklow, and worked his passage to Gaul, landing probably near Bordeaux. After travelling across France into Italy he escaped from his companions, and shortly after became an inmate of the monastery presided over by Honoratus on the islet of Lérins, near Cannes.

After a few years he revisited his friends in Britain, who received him "as a son." A burning desire to preach the Christian gospel to the heathen Irish induced him to leave his kinsfolk and return to Gaul to prepare himself and obtain authoritative support for his mission. He chose Auxerre as his place of study, and remained there for seventeen years, being ordained deacon by Amator in 418 A. D., and bishop by Germanus in 432 A. D. Fortified by the prestige attaching to what was now the

official religion of the Roman Empire, and by his long preparation, and filled with enthusiasm, Patrick returned to Ireland, where his journeyings, his contests with the Druids, his foundation of churches are the themes of many legends. His work appears to have been mainly in the northern half of the island. It is possible that he made one journey to Rome; he founded the primatial church of Armagh, resigned his position as head of the church, retired to Saul, near Downpatrick, in the County Down, and died there 461 A. D.

By relegating the description and discussion of the Patrician documents to an appendix of 167 pages, the text of Professor Bury's book is clear, succinct, and well arranged chronologically. Chapter IV., on the political and social condition of Ireland, and Chapter X., Patrick's place in history, give a general view of the circumstances of Ireland so far as they are disclosed in the Patrician documents, and sum up the permanent effects of Patrick's mission. One of the notable consequences of his work was the diffusion of the knowledge of Latin in Ireland, and to this must be ascribed the rise of the schools of learning which distinguished Ireland in the sixth and seventh centuries.

Clear print, and the copious appendix containing a more technical discussion of the documents referred to than could be well given in the text, make the book easy reading for the general reader, and useful to historians and antiquarians.

A History of Ottoman Poetry. By the late E. J. W. Gibb. Vol. IV. Edited by E. G. Browne, Professor of Arabic in the University of Cambridge. London: Luzac & Co. 1905 Pp. xiv., 364.

An Abridged Translation of the History of Tabaristan. By Ibn Isfandiyar. By E. G. Browne. Printed for the Trustees of the "E. J. W. Gibb Memorial." Leyden: E. J. Brill. 1905. Pp. xiv., 356.

The fourth volume of Mr. Gibb's monumental work covers the period from A. D. 1700 to 1850, and tells of the final fall of the Persianist school before native Turkish influences. The spell which for so long had held the Turkish poets fast, failed with the failing of Persian literature itself, and they turned to their own land and language, its customs, ideas, and atmosphere. At last it seemed that a native poetry was to spring up.

But the change was only partial, and apparently in the Turkish race there was no such ebullient energy as could manifest itself in a genuinely native literature. The mystical dreamings pass in great part; the poet condescends to the earth and material things, and uses gradually a more and more genuinely Turkish vocabulary; simple human love takes the part of wire-drawn Platonisms; a healthy coarseness of idea and expression strikes its way through. As a consequence, the translations given in the present volume will be the first to correspond for the average reader with his traditional conception of the fleshliness of Oriental poetry and the sensuality of the Turk. Yet, though so much is plain and sure, the change was not absolutely fundamental, and the native popular influences which might have vitalized the new movement seem to have been most curiously weak. The old verse-forms still continued, the old verbal preciosity still ruled; the old affectation and subjectivity still too often appeared. Folk-songs and ballads had exercised a certain influence, but it was nothing like to that which they were exerting on the European Romantic movement. Of folk-tale influence there was apparently none. In fact, we seem to have rather a dying out from inanition of the Persian influence and a revolt of Turkish poets from their absolute servitude, than any great infusion of life from the soil beneath. Probably in all Oriental peoples the gulf between folk and book poetry is too great for any but an infinitesimal intercourse and influence. If a new impetus was to come, it had to be from without. It was from Europe, then, and chiefly from France, that it came. The result is the Turkish modern school, a complete transformation of method and spirit, and one probably unique in the literary history not only of the East, but of the West. The revolution wrought by the Romantic movement comes nearest to it in thoroughness, but, however great the leap from Pope to Scott, that from mechanical imitation of Persian mysticism to organic imitation of Victor Hugo is still greater, and was made in a shorter time.

By the death of Mr. Gibb this latter story has been left only half told; the volume yet to come will give what has been found in his papers, with such supplementations as Prof. Browne can secure. Unhappily, it was precisely here that Mr. Gibb's knowledge was most unique. Turkish literature has found few students; this phase of it fewer still; and of published studies there are almost none. The seventy-four pages contributed by Prof. Paul Horn to Amelang's 'Litteraturen des Ostens' is so far the fullest. Even the three chapters and other fragments, then, which Mr. Gibb left behind him, will be a welcome addition to our knowledge. He knew the work of this school, and believed in its future as few have done—perhaps no other European.

The publications of the Gibb Memorial Fund begin worthily with the above-named abridged translation by Prof. Browne. Tabaristan, with which it deals, is a province of Persia by itself apart; geographically cut off by mountains and forests; in history distinguished by its long and often successful struggle against the Muslim Arabs, and as a seat of the Zaydite Imams, one of the first of the Shi'ite dynasties successful in revolt against the Abbasids; in literature famous by many names, and with a dialect of interesting individuality. The charm of character continues with it until this day, although its history is, for the time, long over, and its literature neglected. Mr. Browne describes it thus:

"Of this strange and interesting country the clearest and most ineffaceable recollection must remain in the mind of every traveller who has visited it. I merely traversed it in about a week on my homeward journey from Persia in the autumn of 1888, yet of no part of that journey do I preserve a more vivid impression—the first entry from the great stony plain of 'Iraq-i-'Ajami into the lower hills at Agh, with its rippling streams and almost English hedgerows; the long winding climb to the eastern shoulder of the mighty Damawand; the deep cañons of the Lar; the Alpine beauties of Rene; the gradual descent, through rock-walled valleys, into virgin forests, bright with the red blossoms of the wild pomegranate, and carpeted with ferns and mosses; the sluggish streams and stagnant pools of the coastward fenlands; ancient Amul, with its long slender bridge, Barfurush and the swampy rice fields of Shaykh Tabarsi, memorable in the history of the Babi religion; and the sandy downs towards the Caspian Sea."

Of equal picturesqueness and color is the work of its first known systematic historian, Ibn Isfandiyar. He gives a gossipy chronicle, full of anecdotes, moral, historical, and literary, from semi-legendary times to A. H. 647, the very eve of the Mongol flood under Hulagu. Another band has continued his work to A. H. 750, practically the end of the Mongol power in Persia. The narrative is very broken and irregular, and movements affecting all Asia are seen as elements in local history without much suggestion of the width of their sweep. Therein, it is true, lies its value; we see these events as they were seen at the time. There is much amusement in it also. Witness the tragic tale of Harun ar-Rashid's tame monkey, which shows that Newport monkey dinners have not even novelty. Prof. Browne has translated excellently and given an invaluable index. Mr. Gibb's memory will abide green with such memorial volumes.

The Age of Transition, 1400-1580. By F. J. Snell, M.A. Vol. I., The Poets; Vol. II., The Dramatists and Prose Writers. With an Introduction by John W. Hales, M.A. London: George Bell & Sons; New York: Macmillan. 1905.

The period from the death of Chaucer to the publication of the "Shepherd's Calendar" is unquestionably the most barren in the whole history of English literature. Allegory holds in subjection practically every rival influence during the greater part of this period, and so, with a few notable exceptions, deprives the writings of the time of all interest for the more healthy-minded generations that were to follow. Then when, towards the middle of the sixteenth century, literature begins again to emerge from the shadow, we have, as was to be expected in the nature of the case, merely the first crude experiments which are destined to pave the way to a brighter era. With the scientific spirit, however, which governs even the study of literature in our time, it is not strange, perhaps, that the period in question should have received more adequate treatment than some more recent periods which stand far above it in the quality of their production. Such treatments we have in the standard works of Ten Brink and Jusserand especially, to say nothing of 'The Transition Period,' by Prof. Gregory Smith; and we are glad now to add to their number 'The Age of Transition,' by Mr. F. J. Snell, in the "Handbooks of English Literature," edited by Professor Hales. Mr. Snell had already proved his competency to deal with the earlier periods of English literature by his 'Age of Chaucer' in the same series of handbooks, and from his studies in the fourteenth century he comes well qualified to undertake the less inviting task which the literature of the fifteenth century and early sixteenth presents. In this as in his former work he shows himself, in nearly all instances, thoroughly abreast of the most recent research, and has managed to

prevent the dulness of the period from communicating itself to his treatment of it.

The book is throughout agreeably written, and the author, while rightly laying stress on the more attractive features of his subject, does not fall into the common error of students of mediæval literature, namely, that of overrating the value of the works he discusses. The chief omission which we note in Mr. Snell's volumes is with respect to the romances. This subject belongs in the main, of course, to earlier volumes in the same series, but neither in the 'Age of Chaucer' nor in the present work do we find any treatment of the metrical romances, which surely, with the exception of Chaucer and possibly Langland, constitute the most interesting and characteristic body of verse that England produced in the later Middle Ages. This is a serious defect of the volumes which Mr. Snell has contributed to this useful series, and ought to be remedied in a new edition.

There are other indications, indeed, in the pages which our author devotes to Malory's 'Morte d'Arthur,' which show that he is not perfectly at home in the literature of the romances. Leaving alone the somewhat exaggerated praise which he bestows on Dr. Sommer's edition of this book, he gives credit to Malory for an originality which we believe no one will allow him who is acquainted with the French prose romances from which that writer drew. He cites, for instance, Malory's constant use of dialogue as "a symptom of the dramatic instinct which is one of his strongest characteristics." As a matter of fact, whatever may be the value of this feature of the 'Morte d'Arthur,' it was derived directly from Malory's French originals, as Mr. Snell may convince himself if he will open anywhere, almost at random, for instance, the romance of 'Lancelot du Lac.' Again, the deterioration of Gawain in the 'Morte d'Arthur' is not due, as Mr. Snell imagines, to Malory, but to the author of the Old French prose 'Tristan,' who, to increase the importance of his own hero, tarnishes the fame of that "flower of courtesy." We should like to protest, furthermore, against the passage in which Mr. Snell dubs Bell's edition of Chaucer "a sort of Authorized Version" of the works of that poet. After this we are not surprised to find him citing Tyrwhitt as an authority on English pronunciation in Chaucer's time. Tyrwhitt will always remain one of the great figures in English scholarship, but surely there have been brave men since Agamemnon, among whom we should have reckoned Professors Ten Brink, Skeat, and Kittredge.

On the whole, however, Mr. Snell's 'Age of Transition' is a reliable handbook, and may be recommended as a guide for the period that it treats.

About Hebrew Manuscripts. By Elkan Nathan Adler. Henry Frowde. 1905. 8vo, pp. 168, plus index.

Mr. Adler is a brother of the Chief Rabbi of London, educated for the bar, a bachelor of about seventy, and has spent many years in the hunt for Hebrew manuscripts and rare printed books, travelling for that purpose through Southeastern Russia, Egypt, Persia, and Central Asia. The book is made up of nine detached pieces, the last, on "Jewish-Persian Literature," being written in German, and contributed by Professor Bacher of Budapest. Two of the other pieces (Nos. 2 and 3) have appeared heretofore in the *Jewish Quarterly Review;* two are lectures read by the author to lay audiences. To the true bookworm, to the man who loves "erudition" for its own sake, without looking very deep for the substantial contents of rare prints or manuscripts, this work will be welcome.

The most important of Mr. Adler's finds is a fragment, on two leaves, of the original Hebrew of Ben Sira (Ecclesiasticus) vii. 29-xii. 1; a valuable addition to the greater fragment on whose discovery the celebrity of Professor Schechter in this line of work mainly rests. He gives a facsimile, in a somewhat current hand, a printed copy in which the verses are numbered, and a pretty literal English translation. Many words are wholly or partially vowelled, and in a few places a Qeri and Kethib is set out in the margin as in the canonical books. The next paper, named Karaitica, gives a list of the Karaitic Manuscripts, some of them not very old, which the author acquired in 1895 and 1896—one set at Cairo, another at Perim Pasha in the Crimea, the latter from the widow of a lately deceased Hakham; many of them written in the Arabic tongue, though with Hebrew letters according to the well-known system of transliteration. In others the translation and notes are couched in the Tartar language and writing of the Crimea. Some of these manuscripts are unique; others are of books that had been already edited and printed; many quite new, but of rather slight interest even to the student. But a collector like Elkan Adler cannot pick his books; he has to buy them in the bunch. If he picks, he is outrageously overcharged.

The third piece is an interesting document for Jewish bibliography: a catalogue made as an advertisement by a bookseller at Fostat, about the beginning of the twelfth century, of one hundred books which he kept for sale, many of them quite small. The contents, aside from Biblical or Talmudic text, are written in Arabic, and the titles are in that language, though written in Hebrew character. The mixture, all in the same letters, of Hebrew, Aramaic, and Arabic, is rather puzzling to read, and would be more so but for the few diacritical points demanded by the extra letters of Arabic. Among the books is an arithmetic; there are liturgies, and small sections thereof, Karaitic as well as Rabbinical; there are Midrashim now wholly lost, a Mekilta upon Numbers, while the extant Mekilta covers only Exodus, and books of Responses no longer to be found. Some titles are enlarged into tables of contents, some are enriched by short samples. English notes follow this catalogue, identifying, as far as can be done, the works named in it from other sources.

Then follows the review of a work by Prof. Ludwig Blau of Budapest: 'Studien zum althebräischen Buchwesen und zur biblischen Literaturgeschichte' (1902). It shows mainly how and on what materials in the days before the invention of printing the Bible was written, and how it used to be divided into scrolls or volumes. Next comes a letter, heretofore unpublished, written by Menasseh ben Israel, in Spanish, in 1648. It discusses with some acuteness the chronology of the Bible—the four hundred and thirty years of the Egyptian captivity, the four hundred and eighty years from the Exodus to the building of Solomon's Temple—and the apparent conflict in time between the reigns of the Kings of Judah and those of Israel. Mr. Adler is in doubt whether the letter was addressed to some Biblical scholar in Spain (in which country he found the letter and in the language of which it is written), or to Gerard Voss, a well-known Dutch humanist of that age. It is printed here both in Spanish and in an English translation. Incidentally, Mr. Adler tells his readers that Menasseh ben Israel did not deserve altogether the reputation of greatness and goodness which he enjoys among English Jews: "He strikes me as snobbish and mercenary, and the jealous care with which the Portuguese Jews of Amsterdam refuse inspection of their archives may be due to a pious desire to protect the memory of their ancestors." "The restoration of the Jews to England was due not to Menasseh, but to the Parnassim (trustees of the Congregation), who sent him to England, and had been in correspondence on the subject with the Dutch minister years before resettlement day."

The lecture on "Jewish Literature and the Diaspora," read at Manchester in November, 1903, treats mainly of a subject which would hardly be guessed from its title: the gradual separation of the Christian church from its dependence on, and connection with, the Synagogue. Most striking in this lecture is the low estimate of Josephus expressed therein: "He was a soldier of some classical polish, but, so far as Hebrew was concerned, he was quite illiterate." Judging from the next two papers, "The Humors of Hebrew MSS." and "The Romance of Hebrew Printing," Mr. Adler's readers might conclude that Hebrew manuscripts are not very funny, and that the life of the early Hebrew printers was not very romantic. The last paper, "Zur jüdisch-persischen Literatur," is the longest of the nine. It shows great industry in Professor Bacher, both in gathering his Persian and Hebrew manuscripts and in abstracting them; but such a pall of poverty and ignorance has for centuries hung over the Jews of Persia that their writings could hardly wield any influence, either religious or literary, beyond their own borders. Professor Bacher, however, thinks that the contents of his manuscripts, some of them the works (printed in Hebrew characters) of gentile Persian poets, "open for us an insight into the spiritual life and the culture of the Jews of Persian tongue, as we find (from these literary remains) what elements, as well of mediæval Jewish poetry as of the highly exuberant neo-Persian poetry, found a reception and a home among them."

Two in Italy. By Maud Howe. With illustrations from drawings by John Elliott. Boston: Little, Brown & Co. 1905.

Maud Howe continues in 'Two in Italy' her characteristic studies of Italian life from the point of view of the wandering artist from over the sea. Whether the narrative of such unexpected adventures and chance acquaintances with extraordinary characters would invite or deter future travellers, is an open question—a matter of temperament.

Her readers ought to be prepared for any emergency after what happened to Savonarola Finnerty, a young sculptor arriving in Italy at the time the cholera was raging at Naples. Frightened away from Rome by the report of the approach of the illness, he went to Venice, where his stay is divided between "one night in a cholera hospital, three weeks in quarantine, and fifteen days in prison." It is true that the primal cause of his ill luck was excessive potations of mint julep, added to a vivacious disposition and an unbridled tongue. Savonarola Finnerty was wanting in that indispensable quality of patience which Italians so frequently invoke. Notwithstanding the strangeness of Finnerty's experience, the story rings true—indeed, our authoress in her dedication tells us they are all true stories.

The first in the book, Anacrass, gives a very good idea of Capri life, the exuberant beauty of the country, the lavish hospitality of its inhabitants to all comers known or unknown. Among the guests of the famous doctor, the friend of animals and protector of birds, is an American, who possesses a priceless diamond which is passed from hand to hand. It disappears, and is found after the only stranger has been searched by means of drugging his wine. He excuses himself for "annexing" the gem on the ground of scientific purposes, and all part on the friendliest of terms. The stories are told quite simply without any pretence to style. They are, with the exception of the last, "In Old Poland," all of Italy, and plentifully interspersed with Italian phrases in common use.

Mr. Elliott's illustrations are not effectively reproduced; those of Roccaraso and the streets of country towns are best.

Praise of an Authority by an Authority:

. . . "Scientifically conceived and carefully executed in every part; free from all unnecessary technicalities, and so fresh in its spirit and so informal in its tone that one scarcely remembers the scientific attainments of its eminent author. . . . Style is vivacious, flowing, correct, as pellucid as a mountain brook and free from all those affectations of sprightliness or sentiment which seem likely to become conventional in the literature of nature study. The teacher of biology is especially to be congratulated that he has at his command so rich, reliable and attractive a store of available knowledge."—*Prof. S. A. Forbes of Univ. of Illinois* in *The School Science and Mathematics.*

The Nation.

NEW YORK, THURSDAY, JANUARY 11, 1906.

The Week.

The President, in a letter, assures Congress that he has "carefully examined" into all the charges of mismanagement at Panama, and found every one to be "without foundation in any shape or form." It is certain, however, that, with whatever zeal he may have confuted outside slanderers, he has not even read the accusations made by his own subordinates. His message went to Congress along with the report of the Panama Commission, which comprises the report of the Chief Engineer, Mr. Stevens. It is plain that Mr. Roosevelt cannot even have glanced at that; otherwise he could not have put himself into such open contradiction of its statements. Parallel columns will show the nature of this collision between the Chief Magistrate and the Chief Engineer:

THE PRESIDENT.	THE ENGINEER.
All the work so far has been done not only with the utmost expedition, but in the most careful and thorough manner.	Thousands of yards of material were loaded and hauled by this equipment, over these tracks, to land dumps, the latter improperly located and in character unsuited to the end in view. Doubtless the original purpose under which this work was undertaken was a wise one, but the long continuance of it, and the utter absence, as far as could be learned, of any thought or attempt to plan a systematic method of handling the work as a whole, would seem to be open to grave criticism.

The part of the message dealing with the high salaries paid by the President's order, might be set as a useful exercise for the first class in logic. First, Mr. Roosevelt tells us, "Men fit for the work will not undertake it unless they are well paid." Presently we learn, "Among the men fit to do the task only those with a genuine sense of public spirit and eager to do the great work for the work's sake can be obtained." But the President's blunder goes deeper than formal logic. He knows, and every one knows, that the chief cause of the outcry against the high salaries he has assigned out of the Panama $10,000,000, was the discovery that he had used one of them to take care of a personal friend. He talks now about the need of high pay for those who have to work in "the peculiar conditions of the tropical land," but the scandal was in his ordering $10,000 a year paid to an intimate who had not to go south of the tropic of Washington, and even there had little or nothing to do. Of that bit of gross favoritism the President became so ashamed that he agreed, on the urging of Republican Senators, to abolish the useless office; but now he rails at "any attempt to cut down the salaries" as "ruinous." Was it ruinous when his waste of the public funds on his crony Bishop was detected, and he was compelled to recede from it? Of course, there will be a Congressional investigation of the whole thing. Senator Hale and Senator Gorman are at one in this. It has long been inevitable. Congress would be criminally negligent if it did not look into the scandals. Secretary Taft himself, in his severe criticism of some of the methods of Chairman Shonts, has just shown how grave are the financial and other irregularities to be inquired into. All the Presidential shouting in the world cannot divert attention from the facts.

Washington dispatches make it clear that there is daily less and less likelihood of the ratification of the Santo Dominican treaty. The President is reported to have consented to "any amendments" in order to secure its adoption, but there is known to be at least one Republican Senator who will not vote for it under any circumstances, in which case at least five Democratic votes will be needed if it is to be ratified. It seems hardly possible that these will be forthcoming; indeed, it is an open secret that there are several Republicans who, if they dared, would also vote against it, not more because of lack of sympathy with the Dominican programme than as a check to an over-hasty President. Meanwhile, every day's delay makes it plainer that if there is one thing the country is not crying for, it is the task of policing the Caribbean, and financially supervising any rotten republic which may appeal for our aid on the theory of danger from a foreign Power. Even the warmest friends of Mr. Roosevelt should welcome a Senatorial checkmate in this matter; it can only make him a more useful President during the rest of his term if it is brought home to him that there are some things which the Executive cannot do by himself, "anyhow."

To find an argument for the derelict Dominican treaty in the flight of Morales and in his subsequent fruitless revolt against his own vice-president, requires ingenuity of the robustly optimistic sort. Morales among the revolutionists, we are now told, actually clears the air. We see that the treaty was no mere gentleman's agreement between Presidents, but a pact between "entities." Morales passes, but the Dominican entity persists with needs as crying as ever. All these things must be interpreted in the light of the benevolent dialectic contained in Mr. Roosevelt's state papers. When he is bent on making a treaty with a nation, he can always see an entity flawless, and, in Bülow's word, eminently "treatyable," though to the eye of flesh some turbulent little country may be giving all the outward tokens of a multiple personality more than Protean. Yet this comfortable confidence must, in Mr. Roosevelt's case, be disturbed by a personal twinge. The treaty was, after all, negotiated with one Carlos Morales.

The House leaders have good reason for apprehension when they take stock of the assets of the present "insurgent" movement. To begin with, the opponents of the Statehood bill and the opponents of the Philippine tariff are different sets of persons, so that a coalition means a clear gain to both sides. Then, for a leader, the dissenting movement has the veteran chairman of the Republican Congressional Committee, on whom every candidate has to depend every other year for a multitude of material and other favors. It has issues, moreover, on which spirited and popular pleas can be made with very little effort, and are not so easy to answer. "We are not opposing Philippine free trade," they say; "we are only insisting that the differential which protects the iniquitous Sugar Trust shall be removed. We are not opposing the creation of new States; we are only striving to prevent the annihilation of a commonwealth that deserves to be made a sovereign State." Of course, the two questions have nothing at all to do with each other, but their pendency at the same time has given the chance, and such is the way of politics.

The tangle over the Statehood bill is evidently taking on a more serious aspect. If the opponents of this bill can effect a combination with the opponents of the Philippine tariff and muster fifty-eight insurgents in all, both these measures can be kept from passing the House. Meanwhile, the early reports that sentiment in Arizona was gradually becoming reconciled to the amalgamation of that Territory with New Mexico, are now being counteracted by such violent and threatening protests as were made at Tucson on Sunday, when David S. Rose, who, though mayor of Milwaukee, is nevertheless a spokesman for the Territory 1,500 miles away, proposed "to let the streets of Tucson run with the blood of martyrs" rather than consent to the "infamous" joint

Statehood plan. What appears to us the obviously sensible course—to admit the Oklahoma-Indian Territory State at once and let the Southwestern Territories go for the present—seems hardly to be considered. There are said to be "tactical" considerations which make the two propositions practically inseparable. Just what these considerations are we have never seen explained. If the interests which are trying so hard to keep Arizona intact were also interested in having Oklahoma admitted, there would be an obvious basis for a compromise; but this is not the case. The separate Statehood men in the Southern tier have no more interest in the more northern Territories, as some one has said, than in the canals on Mars. With those Territories admitted, as every one acknowledges they ought to be, the arguments and secret influences in Arizona would be neither more nor less potent than they are to-day.

The fight to exclude liquor from the Indian half of the new State is not based purely on sentimental grounds. Men like Capt. McKennon, a former member of the Dawes Commission, who is a leader of the anti-saloon forces, argue that prohibition for a period of twenty years or more is necessary to the orderly development of the tribes. It is true that there are now six whites to one Indian in the Territory, but there is no logical reason for putting liquor into the hands of the six in order to help them despoil the one—for that is what it comes to. Railway and town-site promoters, land-grabbers, and the simple grafters are arrayed against the Indians to whom the tribal lands have been allotted. To arm these pirates with liquor is to double their destructive power. Even to put one of their tools on the bench is to give them undue advantage. Thus far President Roosevelt has unwittingly aided the spoilers. The Senate should insist upon a thorough airing of Indian Territory politics, and demand of Senator Beveridge the real reason why there is hesitation about carrying out the Government's pledge to keep liquor from the Indians of the Five Tribes.

If the Senate Judiciary Committee, before which the opponents of Luman F. Parker, jr., are urging that his nomination as United States judge for the Northern District of Indian Territory be rejected, is inclined to go into the matter, it will find scandalous material. Briefly, the trouble in the Territory is graft. Young Mr. Parker, son of the general counsel of the " 'Frisco" Railway, with a large mileage in Indian Territory, is only one of the pawns in the game played by the railway promoters and the Western saloon and brewing interests. Whether it is true or not that Parker, while acting as Assistant District Attorney, was in actual criminal alliance with the whiskey-sellers and brewers, does not matter except as it affects his own case. The fact that these interests are powerful enough to secure such an appointment, and to keep a man like Pliny L. Soper to the fore in the discussion of Senators for the new State, is sufficient cause for anxiety. While the Statehood bill is on the very threshold of Congress, no provision has yet been made for securing continued prohibition in that portion of the new State which is to be made up of the five Indian nations.

From the debate on the Philippine tariff bill it is easy to see why Speaker Cannon and the stand-patters so dread having the tariff question "opened." Every time it is opened, such disagreeable facts pop out! On Friday the House had some of them in full sight—the surrender of the Republican party to the Sugar Trust in the matter of the differential, its dread of allowing a fair vote on the abolition of that unnecessary and oppressive duty, the alleged bargain between the Speaker and the President to sacrifice tariff reduction for the sake of railway-rate legislation—all the long record of selfishness and inconsistency. Whenever the Democrats are given a chance, they press home these truths. The Republican complaint is that they do not accept the Philippine bill without a word. It is a measure of tariff reduction, isn't it? Certainly; and we presume the Democrats will vote for it. But it is their duty to try to amend it in order to give relief to tariff-ridden Americans as well as Filipinos. If they succeed, with the aid of some Republicans, in making the measure so just and beneficial that the Republican party managers dare not let it pass, the country will be in no doubt where to place the responsibility.

Gov. Guild's characterization, in his first message to the Massachusetts Legislature, of the Commonwealth's delegation in Congress as a "strong man demanding aggressive action of his peers" in the matter of tariff revision, loses impressiveness as the roll of her representatives is called. Lodge is for readjustment, but it must be done by the Republicans in such a careful way that "no interest shall suffer." Senator Crane does not "demand" anything, so far as the public knows. Of the eleven Republican Representatives in the House, Mr. McCall stands almost alone as a vigorous, intelligent exponent of the undoubted sentiment for revision that exists in Massachusetts. His reassignment to the Committee on Ways and Means was the only recognition by the Speaker of this supposedly aggressive demand for revision. Mr. Gillett's place on the Appropriations Committee is one of distinction, and his chairmanship of the committee on reform in the civil service is an evidence that he is a valuable man—but not necessarily in a fight for free hides. Of the other two chairmanships allotted to Massachusetts, "Son-in-law Gussie" Gardner has that on Industrial Arts and Expositions, and Mr. Lawrence that on Expenditures in the War Department. Gov. Guild will have to revise his figure of speech likening these men to the founders of Massachusetts who "set their hands to the rocks and forests," and who sang amidst the storm, "and the stars heard, and the sea."

Senator Blackburn's defeat in Kentucky will relieve the Senate of one member who can well be spared, and there are flattering rumors of Senator Gorman's coming retirement. His giving up of the minority leadership in the Senate is said to be certain. Senator Bailey has been asked to become his successor, but announces that he will not accept the post, since he has "not acquired the art of being agreeable under all circumstances." Strong convictions and a sharp tongue are, we must admit, usually regarded as a disqualification in a party manager, but without good reason, we think. John Sharp Williams can say rasping things as well as Senator Bailey, yet he has not failed as a leader on that account. Indeed, we think the Democrats in the Senate might decidedly benefit by the substitution of Mr. Bailey's intellectual and outspoken vigor for the oleaginous and secret ways of Senator Gorman. We think that Republican Senators would agree, in private at least, that there is no Democratic Senator whom they more respect—or fear—in debate than Senator Bailey. It is a queer comment on political standards that such a man should be thought not a desirable leader of his party.

The campaign for the Democratic nomination for Governor of Georgia waxes and wanes in interest as the two chief rivals, Hoke Smith of the Atlanta *Journal* and Clark Howell of the *Constitution*, discover new supplies of political ammunition. It seems to turn just now on the question, "Is it necessary to take any further action to disfranchise the negroes of Georgia in order to guarantee white domination?" The *Journal* declares that nothing else than an educational qualification will make Georgia safe. But the *Constitution* quotes Senator Money of Mississippi to prove that an educational qualification, instead of reducing the negro vote, actually increases it, in proportion to the white vote. The simple old provision inserted in the Georgia Constitution by Robert Toombs, requiring a

voter to pay his poll tax, is, it is urged, more effective than anything else in keeping the negroes from voting. Senator Money says: "The educational test may operate to create a desire to qualify themselves on the part of a few of the ambitious negroes, but it has absolutely nothing to do with keeping the negro masses from the polls. I am sure this is true in Mississippi." Georgia is certainly "safe" in any case, and the campaign is serving to show the decreasing importance of this political bugbear.

The selection of Wadsworth as Speaker of the New York Assembly is what patrons of the prize-ring would call a bad knock-out for Odell. The boss mustered fewer votes than most people expected. True, he was opposed by the State administration; but then, only a few short months ago, he was absolute master of the machine, and he innocently looked for the support of many men who owed to him their positions as members of the Legislature and as incumbents of office under Roosevelt and under Higgins. He looked in vain. The professional politician does not spend himself on sentimental attachments; indifferent to charges of ingratitude, he turns to the rising, not the setting, sun. Odell, kicked down the Capitol steps as ostentatiously as he himself kicked Platt down them not long since, has nothing to console him but Platt's philosophy of defeat as phrased by Isaiah: "The ox knoweth his owner, and the ass his master's crib." The owner seems to be Theodore Roosevelt.

Gov. Higgins's recommendations on election reform are sound so far as they go. No one but Senators Platt and Depew will be disposed to dispute his dictum that "no [business] corporation exists which includes among its lawful purposes the right to donate its moneys to influence an election. The practice is morally as well as legally wrong." In view of recent revelations we do not believe the Legislature can hesitate to adopt the Governor's recommendation: "that the making of political payments by corporations be made a penal offence, and that all officers and agents of such corporations knowing or approving thereof be subject to fine and imprisonment." Some members may offer the amendment "fine *or* imprisonment," but the "and" should stay. The Governor is not very explicit as to the direct primary and a new ballot law, but his heart is, we trust, in the right place. The most important topic of the message is insurance legislation. Here, too, the Governor deals largely in generalities; but he has the excellent excuse that courtesy compels him to wait for the report of the legislative committee. Gov. Higgins is also ready for thoroughgoing changes, though, in the effort to be judicial, he falls into the Roosevelt style of teetering: We must have a law which shall be "drastic but practicable, radical but sane," framed in a spirit which shall be "courageous but not hysterical." Specifically, he would have the State Department of Insurance more vigilant; the investments of the company more carefully safeguarded; the expenditures for salaries and the other purposes more closely scrutinized. The directors should have no conflicting business connections; the policies should be free from complexity and ambiguity; and the gains of the companies should be equitably distributed. Here is a task for men.

State Senator Brackett's resolution asking Depew to resign has thus far done nothing more than provoke acrimonious discussion. Senator Brackett himself cannot expect that the Legislature will go to the length of formally condemning Depew. That would be too ghastly a piece of hypocrisy. If our legislators test Depew's conduct by comparing it with their own, they will probably agree with Senator Malby that the versatile representative of the Vanderbilts is "one of the grand characters of this country, and one of the great characters of the civilized world." Senator Brackett complained that Depew received from the Equitable $20,000 a year for which no services were rendered. Depew can retort that various members of the Legislature enjoyed the hospitality of the Mutual Life's "House of Mirth," and received from the several insurance companies more than $20,000 a year—for all of which valuable services were rendered. A virtuous Legislature which tries to get Depew out of the United States Senate should let judgment begin with the House of God—find out what members have been in the pay of the insurance lobby, and scourge them from the consecrated halls of the Capitol. But whatever may be said for or against Depew and his critics, the Brackett resolutions fairly express the sober opinion of citizens of this State. On a popular vote these discredited statesmen would be beaten out of sight. They grossly misrepresent the intelligence and morality of New York.

After a long and costly trial, Charles Gilhooley and a fellow-slugger, together with five labor-union officials of Chicago, have been convicted of "conspiracy to do bodily injury to a workman who refused to leave his place when a strike was called." The *News* of Chicago, which cannot be accused of antagonism to "labor," declares that the verdict is just. The evidence showed that the Carriage and Wagon Workers' Union, being on strike, hired three professional bruisers, with Gilhooley as chief, to beat and cripple those workmen who stuck to their jobs. One of them, Carl Carlstrom, was terribly beaten by these roughs, and died two weeks later, pneumonia having followed the injury. The testimony did not show that the beating was the direct cause of Carlstrom's death, but conspiracy was clearly proved. It was shown that the union paid Gilhooley and his "wreckers" for their bloody work, and that it advanced money for their defence in court. The union's executive board, by formal action, agreed to pay the sluggers' wages. Yet the Carriage and Wagon Workers' Union was not in all this doing an unheard-of thing. Chicago is too familiar with this particular brand of union "control." As the *News* says, "the punishment accorded by the jury—five to ten years in the penitentiary and a $2,000 fine for Gilhooley, and one to five years' imprisonment for each of the other six—is not too severe." Notoriously, a penal lesson like this is not the peculiar need of Chicago, among all our great cities.

When a union between the National Academy and the Society of American Artists was mooted last winter, we predicted that it would not be difficult for the two nominally rival organizations to arrive at an understanding. As a matter of fact, the joint committee has recommended a plan of merger which is admirably simple. The Society of American Artists will sink itself in the older Academy on condition that the Academy extend its membership limit, give to associates as well as academicians a voice in its affairs, and enlarge and liberalize the membership of its juries. In other words, the Society will consider its work done if the Academy will give fair recognition to the actual accomplishment of members of the Society, and will adopt in principle the reforms for which the Society was founded. This may be done without any heartburnings, for the Academy, year by year, has grown more open-minded towards outsiders and less inclined to press to an extreme the prerogative of its members. Meanwhile there has been a virtual interchange of membership between the two bodies. Like Harpagon's cook-coachman, many an artist may be a member of the Academy or of the Society, according to the train of capital letters he doffs or dons. For example, at the current Academy exhibition there are some forty exhibitors who are members of both organizations. We trust that the report of the committee will be accepted on either hand. Art in America has only to gain by a movement that means greater concentration of effort on the part of the artists, and a more dignified and representative character in the public exhibitions.

MR. SCHIFF'S WARNING.

Mr. Jacob H. Schiff's remarks on the money market and the currency, before the Chamber of Commerce on Thursday need to be considered very carefully in the light of the situation which called them forth. The advance in demand loans above 100 per cent. the previous week in Wall Street, and the opening of the new year with the highest rates reached at this period in a generation, were described by Mr. Schiff as "nothing less than a disgrace to a civilized community." Unless, he proceeded, the conditions which make possible such abnormal phenomena in the money market are soon changed, the time will come when "we shall get a panic in this country compared with which the three which have preceded it would only be child's play." What are the facts which justify so serious a warning?

"We all know the cause," said Mr. Schiff; "the cause is in our insufficient circulating medium, or the insufficient elasticity of our circulating medium." This inelasticity seems to Mr. Schiff to be largely, if not mainly, attributable to our Sub-Treasury system—Government money, left on deposit with the banks, added to the supplies on the open market at a time when "the national banks were gorged with their deposits." Mr. Schiff holds that this Government money ought to have been withdrawn from the banks when the market did not need it, and then to have been held in reserve in the Treasury, awaiting the hour of outside stringency. Thereupon, relief by the Government would have been practicable. But Secretary Shaw disliked to withdraw deposits, and left the larger part of them in the banks until the autumn; he was therefore not in a position to increase Treasury deposits in the December stringency. This was the drift of Mr. Schiff's review of the conditions precedent to the 100 per cent. money market. That the money stringency was caused solely by "the speculation which prosperity always brings forward," he does not believe; his reason being that "in France, in Germany, in England, speculation has been rampant at certain periods, and still you have never seen the money market for sixty days in such a condition that rates have varied all the way from 10 to 125 per cent."

Mr. Schiff's authority as an expert on the money market is unquestionably high. But agreeing as we do with his main conclusions, we find much difficulty in subscribing to his reasons. Wall Street is familiar with the "money squeeze" brought on by extensive lock-up of cash in the Treasury, at a time when demand for money on the open market is very active. Such a condition existed in 1899, when, in the face of a narrowing New York bank reserve, the Treasury's surplus revenue ran to $23,000,000 in three months. It was a real cause of the disordered autumn markets in 1887 and 1888, and in other years of excessive public revenue.

It has not been, however, a cause of this autumn's stringency. There have been "surplus months" and "deficit months" since the fiscal year began on July 1, but the net result has been that the Treasury has paid out $7,300,000 to the money market. Furthermore, the Treasury did call in a good part of its bank deposits during the period of easy money. Between the first of last January and the end of August, it reduced them $47,000,000; it did so, not because the market did not need this money, but because the Treasury did; its revenue deficit having amounted to $41,000,000 in the fiscal year 1904 and to $23,000,000 in 1903. Granting that the machinery for the shifting of these funds is clumsy and awkward, we are nevertheless unable to understand how the recent extraordinary money stringency can be ascribed to it.

We believe the cause of that stringency to be so plain, and to be so intertwined with practices dangerous to our financial future, that our chief feeling about Mr. Schiff's address is one of regret that he should wholly have failed to point it out. We refer to the use of bank credit in the high Stock Exchange speculation of the past four months. It is true that Europe has witnessed stock speculation without seeing also 50 or 100 per cent. call money; Germany has had an experience of the sort this season, though we believe that 7 or 8 per cent. on the Berlin Stock Exchange was the worst of the money stringency. But the speculations indulged in in those markets are, in our judgment, trifling affairs beside what has lately been presented to the view of Wall Street.

We have had a market admitting that one $70,000,000 stock, another of $50,000,000, and a third of $30,000,000 were virtually cornered; their prices were then advanced, after the opening of September, by the speculators in control of them, thirty, forty-seven, and one hundred and seventy points respectively. These operations, and numerous similar ventures which accompanied them, were undertaken at a time when the legitimate demands of trade and industry were at the very highest. It is notorious that these speculating millionaires and their following were provided by our banks with money which had been largely obtained from deposits made by Western institutions in this city, and which were certain to be recalled when the active harvest trade set in. Whether loaned for such purposes on call or on time, no intelligent man in Wall Street doubts for an instant that these huge advances, for pure stock-jobbing operations, so far tied up available resources of our banks that they came into December wholly unable properly to meet the situation. The extent to which, even then, with 25 per cent. money and bank reserves below the legal minimum, great lending institutions continue to provide the fuel for continued speculation, leaves the money convulsion at the end of the year, in our opinion, a phenomenon which the simplest mind can understand.

We wholly fail to find, with Mr. Schiff, a primal cause for it in the Treasury operations or in the rigidity of our banknote currency. In both directions there are constant possibilities of danger and urgent need of reform, but we must look elsewhere for the causes of this autumn's episode. We agree with Mr. Schiff that it has been a disgrace to a civilized community. We consider it such, however, because, after years of talk about the growing intelligence and conservatism of New York finance, and with the instance before their eyes of a great European bank which publicly warned its own market's stock-exchange speculators that it was prepared to obstruct their ill-timed ventures until the money strain was over, our own institutions, with some honorable exceptions, have simply gone with the Stock Exchange. Again agreeing with Mr. Schiff, though on different grounds, we suspect that some day a very serious lesson will be taught to our stock-jobbing financiers and their bank supporters, unless they abandon their recent practices. And the banks ought by this time to be aware that the distrust of motives and purposes inspired in the public mind by such events as we have seen, is the main barrier to any intelligent revision of the bank circulation system.

THE AUTOMATIC TARIFF BRAKE.

For a revelation of the pure essence of contemporary tariff doctrine nothing could possibly serve better than the discussion now going on relative to the duty on works of art. This schedule is only a small revenue producer—the firecracker duty contributed almost as much last year at the Custom House. Art is not an historic subject of taxation. Finally, the members of the class supposedly protected, namely, the American artists, are practically a unit for the repeal of this tariff. The protectionist is as much at a loss for arguments to defend the provision on its merits as is the free-trader himself.

For all this, it is practically certain that Section 454, like all the others, will remain unaltered during the life of the present Congress. Why is this? Why must a barbarous enactment remain on the statute-book when it has hardly a single open advocate and its very beneficiaries are loud in denouncing it? The answer is, that the contribution of the present period to the traditions of the tariff has been a set of new principles which, taken together, not only form an effectual brake on all reformatory legis-

lation, but even relieve the tariff custodians of the annoyance of having to defend by argument the particular provisions which may be under attack. There has been devised a series of reasons for inaction which have nothing whatever to do with the protective principle or any other economic consideration, and which could be used as effectively to defend the worst as the best tariff law ever framed.

Chief of these is the proposition that, if one schedule is touched, all must be overhauled. This is not altogether new, of course, but it has never been used with such assurance and such sweeping application as in the present era of Dingleyism. Let foreign pictures in free, and what will become of the tin-plate manufacturer? Put hides on the free-list, and who will provide for the steel-rail manufacturer? Bring Canadian lumber to our mills, and how can the cutlery-maker keep from putting up his shutters? This is an argument that, if made at all, no one respected until the last quarter of our national history. It was once an extremely common event for Congress to pass an act altering one or several schedules, without this action precipitating a general revision. Between 1794 and 1816, according to Mr. Stanwood's 'American Tariff Controversies in the Nineteenth Century,' twenty-four acts modifying the tariff were passed. Thus, the sugar and tea schedules were taken up by themselves in 1795; molasses, velvets, and muslins, and some other articles, in 1797; salt later in the same year; fish, fruits, spices, window glass, cigars, and one or two other articles in 1804; old copper, saltpetre, and sulphur in 1805, and so on. The famous woollens bill of 1827, which failed to pass the Senate, got full consideration from the House without dragging in all other interests concerned with the tariff. The rate on manufactured iron was changed in 1830 to equal that of bar iron, and in the same year—not by the same bill—alterations were made in coffee, salt, molasses, and tea. Leaving out of account the war-time changes in duties, there remains as a conspicuous instance the Wool and Woollens act of 1867, raising the duties in one schedule, passed by a Congress which refused to make a general revision. These are but a few capital cases illustrative of the sort of changes which used to be possible, in response to just such demands as are being made to-day for modification of specific duties.

Of course, log-rolling methods have been perfected in the last forty years, the interdependence of industries is closer and their means for exerting pressure at Washington in some respects stronger. Still, there is abundant evidence to show that there is no immutable and fundamental law of nature to the effect that whosoever alters one tariff provision must straightway alter all.

Next in importance to the principle thus described is what may be called the law of alternate objections. Blessed be the memory of the fathers who decreed that the long rather than the short session of Congress should come just before the biennial elections. No one can tell how much trouble it has saved. Congress cannot be expected to revise the tariff just before election. At the short session, although that consideration no longer acts as a deterrent, there is not time to put through a bill, much as the lawmakers would like to. Obviously, these two arguments can be alternated from now till doomsday and never lose their freshness.

This excuse of "no time" uttered so often by poor harassed Congressmen, footsore with tramping over Washington in quest of fourth-class postmasterships and invalid pensions, has itself, by the way, some interesting aspects. "Of course, it must take long deliberation to pass important legislation," exclaims the sympathetic bystander. Yet how long does it really take the House of Representatives as now controlled to dispose of such momentous affairs as it is allowed to consider at all? The Esch-Townsend bill was certainly the most important and most conspicuous measure before the Fifty-eighth Congress. Yet it was taken up on a Monday a little after noon and passed on the following Thursday at 3 P. M. The Philippine Improvement bill received the undivided attention of the House from noon one day until 1 P. M. on the next.

The Dingley law, it must be remembered, has already remained in force for a longer period than any previous act since the Walker tariff, the term of which it will equal on February 28, 1908. But the day has long passed when the way of replying to an assault on any given schedule was an attempt to prove that the clause itself was valuable.

THE CHINESE BOYCOTT.

John W. Foster, ex-Secretary of State, is not among those who believe that the Chinese boycott is merely a temporary affair. Some of our consuls, eager to give the State Department the news it most desires, may take that view, but Mr. Foster, in his notable article in the current *Atlantic Monthly*, declares flatly that if our "present legislation is continued in force, the boycott of American goods in China will not only continue, but will grow in extent and vigor." And he adds significantly, "The danger is that it will not only affect our commerce, but extend to all other American interests." This he explains by pointing out that China need only apply to American citizens within her territory the same laws and regulations that are now applied in the United States to Chinese subjects. By this means, and without proscription or persecution, all American enterprise in China can be brought to a halt.

This relates not merely to missionary endeavor, but to business undertakings as well. The basis for the original treaty of 1868 between China and the United States was "a spirit of reciprocal and sincere friendship, and with entire justice." Since justice in this country has meant the exclusion of all Chinese bankers, capitalists, contractors, builders, engineers, mining experts and operatives, manufacturers, machinists, missionaries and physicians, justice and reciprocity in China would mean the exclusion of precisely the same classes, with the practical cessation of trade and effort along those lines. It would not quite mean the closing of the open door to Americans, but something perilously near to it. Moreover, it could not be resented in any way except by the application of brute force. We might bombard Chinese towns and again land troops in China; but with what decency, if we were demanding of China for our people privileges we denied to her own? Moreover, the time is passing when China can be overawed by a handful of ships. The extraordinary revolution in national sentiment and in methods of government now going on under our own eyes is creating a new China, even as a new Japan has arisen overnight. It is something to be devoutly welcomed; the time cannot come too soon when China will be able to put an end to such thefts of her territory as have disgraced Germany, France, and England.

But meanwhile the public may ask, Why is China so particularly embittered against the United States, which has never filched any of her territory? The answer is in Mr. Foster's article. It is because the United States as a nation has repeatedly broken its word to China; because Chinese citizens have been treated, not like human beings, but like brutes, and this not only at our custom houses, but within our cities and States. We welcomed them by thousands after the treaty of 1868; Secretary Fish officially stated that the increase in emigration was desired by our people. Eagerly our railroad builders seized upon Chinese to construct the railways which opened up the great West. Even as late as 1883 there were 15,000 Chinamen at work on the Northern Pacific, and but for their industry that railroad could never have been completed in time to save its all-necessary land grant. Before that, however, the demagogues and labor unions of California had begun to assert themselves. Not content with mobbing and killing Chinamen where they found them, they first tyrannized the California Legislature, and then marched

on Washington. The "wise discretion," "sincere friendship," and "entire justice" so readily promised were quite forgotten; treaty promises were ignored, particularly by executive officers. As a matter of fact, the immigration officials have repeatedly assumed that Chinese had no right to trial by jury, to "due process of law for the protection of their lives and property." In the case of the United States against Ju Toy, decided last May, Justice Brewer of the Supreme Court commented scathingly on the Immigration Bureau's Star Chamber methods and their denial of witnesses, counsel, and jury to Chinamen who were solemnly promised the same rights as those given to American citizens.

Mr. Foster could have filled his entire article with individual cases of the savage ill-treatment of Chinese. He speaks of only two. The first was the suicide of the Chinese military attaché, Tom Kim Yung, after his shocking abuse at the hands of the San Francisco police, for which outrage nobody was punished. The thousands of countrymen who followed him to the grave regarded themselves, Mr. Foster says, as personally outraged by the wrongs done him; it is easy to conceive what their letters home must have contained. To the lawless raid upon the decent Chinamen of Boston by immigration officers in 1902, Mr. Foster gives much space. As our readers must be familiar with this disgraceful occurrence—for which no official has ever been punished or reprimanded—we would merely remind them that hundreds of innocent Chinamen were arrested without warrants. Merchants and laborers alike were thrown into wagons; 250 were crowded into two small rooms in the Federal Building, where there was only standing space, and compelled to remain there in some cases for twenty hours—guilty of no crime or wrongdoing, and tortured thus merely that the authorities might run down a few who had sneaked in from Canada in violation of law. Had this happened to American merchants in Shanghai, all America would have been demanding revenge at the point of the sword. How great a part this outrage had in precipitating the anti-American boycott cannot be estimated. It is a fact that the details were spread all over China officially and unofficially.

There is but one remedy and one hope, as Mr. Foster points out: absolute justice on the part of Americans, which includes the enactment of a fair treaty. President Roosevelt has taken this stand, and has already ameliorated the harsh enforcement of the immigration laws. But whether the Government as a whole is to reassert itself, whether Congress will decline at last to abdicate its functions at the behest of labor unions, remains to be seen. The financial loss to the pockets of our merchants and traders will at least show them that justice in this case spells dollars and cents.

NEW PHASES OF PRIMARY REFORM.

The balanced utterances of Gov. Higgins on the subject of primary-election reform are not likely to satisfy those who have created the "growing sentiment" which he reports in this State in favor of direct nominations. "The new method as at present developed," he says, "has grave faults as well as attractive features, and a careful consideration of the effect of primary laws of other States should precede any attempt to model legislation thereon." The fact is that, in this period of boss-smashing, orators and campaigners have been calling for the "direct primary" as if that expression signified a hard-and-fast, definitely worked-out system, like capital punishment or the Torrens plan of land titles, instead of an idea that is still in the experimental stage.

If the abolition of conventions were the only thing to be desired, there would be no need of going to the Legislature at all, at least so far as local nominations are concerned. New York already has the direct primary in optional form, the Legislature of 1900 having enacted that—

> "In case the general committee representing a party in any city or village to which this act is applicable, or in a county wholly within any such city, or in a borough of any such city, shall adopt, by a majority vote, a rule that the nomination of that party's candidates, for specified public offices to be filled wholly from such subdivision, shall be made at the primary elections of the party, then, so long as such rule remains in force, the nomination of that party's candidates, for the public offices specified in such rule, shall be made by the enrolled members of the party at the official primary elections of the party held on the annual primary day."

It is under this provision that the Direct Nominations League, of which Gen. McAlpin is president, is proceeding with its petitions to our county and city committees for a trial of the new plan.

The experience of other States has taught that the details of a direct primary law are considerably more important than was at first supposed. The first point to receive attention generally was the fair and accurate separation of Democrats from Republicans. The party enrolment a year in advance, as required by the existing primary law of this State, provides already one of the most successful means to this end. The requirement of a public declaration of party allegiance at the voting place on primary day has proved less satisfactory in a number of ways. Yet the simple stipulation that a voter who participates in the nomination of one candidate of a given party must not join in any other party's nominations for other offices, is regarded as a sufficient safeguard in some of the States with most carefully drawn primary laws.

Still, even after the packing of one party's caucus by members of the other is guarded against, there remains the question of the method of nomination. Conventions are governed by either majority or two-thirds rules; none of them permits a minority to select the candidate. Manifestly, if the direct system accomplishes its object of bringing out many candidates for important offices, the chance of any one getting a full half of the votes is diminished by that very fact. Should nominations by a mere plurality be permitted under the direct primary? The makers of the last such law passed, that of Illinois, evidently thought not, for they provided that when no candidate in the primary has a majority of votes, the result shall not govern, and a convention is to be held instead. It is out of this objection that the second-choice scheme has developed. A bill which was introduced in the Legislature of 1903 in this State by Mr. McClelland was in its main features similar to the ill-fated "Mary Ann" bill which Gov. La Follette tried to put through the special session of the Wisconsin Legislature just before his resignation.

The idea is that every voter in the primary is to record a second as well as a first choice for the nomination to each office. If any aspirant has a majority of "first-choice" votes, he is, of course, nominated. If no candidate has such a majority, however, the one with the smallest "first-choice" vote is to be dropped from the canvass, and the "second-choice" votes of his supporters added to the "first-choice" votes of the other candidates. The "second-choice" votes of candidates at the bottom are thus added in until some candidate does secure a majority over the others.

This is an untried plan. If three or four candidates are deadlocked in a convention or legislature, the choice is likely to fall on some absolutely unthought-of man proposed as a compromise. Under this plan the resultant candidate should be the contestant who is best able to retain the good will of his opponents. This is not a principle from which any one can well dissent, but the success of the project in practice remains a trifle problematical. Also untried is the Wisconsin plan of convening the State and legislative candidates each year to draw up and pass the party platform.

It has been one of the singular features of primary reform that novel provisions have been so generally copied before they have been tested. There were jeers only a few years ago at the notion of nominating United States Senators by popular primary. As a matter of fact, it has not yet been done in a Northern State; still, every primary law passed in the last three years contains this feature. There is accumulating a

mass of data which our Legislature can study; and when others are so willing to attempt the experimenting, there is certainly no reason for ill-considered legislation in this State.

THE PRINTERS' STRIKE.

The decision of the Appellate Division of the Supreme Court, on January 2, declaring unconstitutional and void a law restricting the freedom of contract in the employment of labor, falls pat with the strike in the printing trade which began with the first of the year. This is distinctly a strike for the closed shop. That means, of course, a labor monopoly. The Typographical Union would make it impossible for any workmen outside their organization to obtain employment. It would compel all publishers and printers and newspapers to hire only members of the union. Yet it is precisely this spirit of exclusion and tyranny which the Court has just decided to be repugnant to our institutions and laws, and its translation into action violative of the Constitution of New York.

The law in question was one passed in 1887, under the general head of "Coercion by Employers," which forbade the making of an agreement not to belong to a labor union the condition precedent of employment. Such a statute, the Justices of the Appellate Division now declare, was beyond the competence of the Legislature. The Court denies the power of the Legislature to "compel employers, under penalty of fine and imprisonment, to employ union men only." The freedom of contract implies the right of every man "to employ whomsoever he pleases, . . . unless, of course, he makes a contract contrary to public policy." It is alleged, to be sure, that any kind of impairment of the privileges or pretensions of labor unions will lead to unrest and disturbance of the public peace; but the Judges neatly dispose of this by remarking: "We recollect no instance in which it has been held that it is competent for a Legislature to restrict one's constitutional rights upon the theory that, if he be permitted to exercise the same, others will become incensed thereby and violate the law and be guilty of a breach of the peace or create public disorder."

Other questions are involved in the printers' strike, but they are subordinate. One of the demands is for nine hours' pay for eight hours' work. That is a matter fairly to be tried out between the union and the employers. It is mainly a question whether the trade will bear such an increase of wages. That a higher cost of production would be involved, is agreed on all hands. The Typographical Union admits that the eight hours' day would mean an increase in cost of 15 per cent. The Typothetæ figure it at 23 per cent. In either case, the question is whether the added cost can be passed on to the consumer—that "forgotten man" whom the labor monopolists regard, equally with the tariff monopolists, as a stupid and patient beast of burden, who will stagger along under any load piled upon his back. But, as we say, this dispute about more wages is one that is to be decided by an actual test of the labor market. The employing printers aver, first, that they cannot afford to pay the higher rates, since they are necessarily exposed to out-of-town competition; and, second, that they can obtain, with adequate police protection, all the skilled labor they need at existing prices. That is to be determined by experiment. The union is within its rights in demanding higher wages; the employers in demanding that men willing and anxious to work at the rate now paid be allowed to do so. This is elementary.

But behind the money question lies one of vital principle. The union strikes for the closed shop. The employers are fighting for the open shop; which simply means that they are fighting for the right to own and control their own property. Under union dictation, the owner of a printing-office cannot put his own son to work at the machinery in his own composing-room; cannot hire or discharge his own employees; cannot control even his own foreman; and has to submit to every kind of petty tyranny and restriction of output. How these impositions strike a self-respecting American employer may be seen in the plain-spoken circular addressed to the compositors of the Hill Publishing Company by its president. He himself has risen from the ranks—is still an honorary member, he states, of the Brotherhood of Locomotive Engineers—and feels strongly about the closed shop, or any other union device which tends to "grade the workmen down, not up." We quote a few of his homely words of refreshing sense and candor:

> "I shall be sorry to see a man go away—especially those who have been with us from the start. I do not believe that you can get better jobs or a more appreciative 'old man.' But this 'old man' cannot stand everything. The savings of a life of hard work are in this concern, and all the fun he can get out of it is to run it his own way, with due regard for the rights of others. He always has worked more than eight hours a day, and always expects to.
>
> "If the officers of a labor union run this concern, some one else will own it—I won't.
>
> "Hereafter the foreman works for the owners, and not for the union.
>
> . . . . . .
>
> "Now, the whole thing simmers down to about this:
>
> "You say to us—Shut down this plant another hour per day, pay the same wages that you do now, and place the conduct of the shop in the hands of our union and walking delegate, or we strike.
>
> "We say to you—We insist on our right to run our own concern nine hours per day, run an open shop, and employ whom we please. If that is the issue, go ahead—we will fight."

Few not directly affected are aware of the overweening pretensions and intolerable exactions of the Typographical Union. It aspires to be supreme over both Church and State. Here is an extract from the oath which its members are required to take: "*That my fidelity to the union and my duty to the members thereof shall in no sense be interfered with by any allegiance that I may now or hereafter owe to any other organization, social, political, or religious, secret or otherwise.*" It is not strange that a Catholic priest should have read this oath to his congregation and announced that no person subscribing to it could, in his parish, share in the sacraments of the Church. And every newspaper in whose office the tyranny of the Typographical Union is set up, could testify to the way in which it follows up its assumption of divine right by attempting to enforce the most absolutist claims. Not simply does it claim to dictate in regard to wages, apprentices, machinery, output, etc., but it is rapidly extending its sway over other departments, so that in some instances the proprietors cannot discharge a reporter or hire a skilled proof-reader or dispense with the services of a dramatic critic without first consulting the magnates of the Union. This is one reason why the press of the country should take a deep interest in this strike of the Typographical Union. It is a contest between freedom and tyranny in the whole printing trade. If the open shop wins, there will be gains for liberty all round. The newspapers that are union-ridden may hope to strike off some of their galling shackles. But if the closed shop triumphs, the next thing will be the closed mouth; for it may not be long before the Typographical Union, once able to say in what way opinions shall be printed, will arrogate to itself the right to decide what opinions it will allow to be printed at all.

THE PAY OF MUSICIANS.

The strike of the chorus singers at the Metropolitan Opera House has called attention, among other things, to the wide disparity between the earnings of those at the bottom of the operatic ladder and those on the top rung. A year or so ago Mme. Emma Calvé made a public protest against the inadequacy of the remuneration received by chorus singers in grand opera; yet, so far as known, she did not offer to have part of the demanded extra payment deducted from the $2,000 she received for every performance in which she appeared. Mr. Conried, no doubt, would be happy to pare the highest salaries on his list for the benefit of the lowest, but he naturally hesitates to add to his managerial expenses $1,000 a week. That increase, in an uncertain season, might wipe out all profits, and more.

He had certainly a grievance in this

case. The singers had, of their own free will, individually signed contracts to perform specified duties for a certain number of weeks. They wantonly broke their contract—a proceeding for which employees ought to be liable to some punishment as well as employers—and they aggravated the offence by doing their best to destroy one of the gala events of the season and mar the pleasure of nearly four thousand persons who had nothing whatever to do with their quarrel. But this is the usual union method. The audience was keenly alive to the situation, and when Mr. Conried came forward and announced that he had "firmly and absolutely refused to be dictated to by the chorus as a labor union," there was an outburst of applause such as usually follows only the song of some favorite tenor or prima donna. The public was overwhelmingly with the manager.

Before the chorus took its altogether indefensible step, Mr. Conried had signified his willingness to meet it halfway on the salary question and other points in dispute. After the total disregard of the artistic side of the question shown by the chorus singers on strike, he might question their right to be considered artists. Yet he could hardly fail to see the justice of granting them at least as much as the chorus girls get in the theatres where operettas and musical farces are performed, which is $18 a week. Even that is little enough, considering the hard work to be done; yet the supply far exceeds the demand. When Mr. Savage advertised for a flower-girl chorus for his production of "Parsifal" in England, more than a thousand young women applied.

The incident at the Metropolitan will, no doubt, lead to considerable discussion of the general question whether music pays as a profession, and whether the thousands of girls who yearly flock to New York from all parts of the country had not better stay at home, help their mothers, and get married, following the advice of Hans von Bülow. The vast majority of those who prepare themselves for a career as opera singers or concert-givers end by becoming teachers very soon after their first appearances in public. After having had a training costing years of hard work and thousands of dollars, they find that it is extremely difficult to get a chance for an appearance at an entertainment which the public and the critics are sure to attend. Managers and conductors are beseiged by young musicians, most of them mediocrities, who jostle the better ones and crowd them out by sheer numbers. Most of these are glad to play or sing for nothing for the mere chance of appearing in public; some of them even pay for the privilege of showing off their accomplishments at Sunday concerts or others.

After all, the profession of teaching, to which most of the students of music are condemned, may be a source of as much happiness and emolument as a stage career, with its many worries, uncertainties, and disappointments. There are teachers of the piano or the voice in this country who earn $10,000 or more a year, and command as much respect in the community as any pianist or singer. Many earn half that sum. The rank and file, to be sure, work for much less; but that is the case in all the professions. If we may accept the estimate of a writer in *Harper's Weekly*, "the average earnings of qualified and certified doctors of medicine in the United States do not exceed $600 a year"; that is, the average American physician earns only $300 more in a year than Mr. Conried's chorus singers do in five months; and he has had a much more expensive education. As regards teachers in public schools, it has been found that, in a list including 467 American cities, there were 53,554 positions with annual salaries of $600 and over, besides 14,193 of $500 to $600, and 17,728 annual salaries below $500. Commenting on these figures, Commissioner W. T. Harris has remarked that "no teacher has a right to complain, on a socialistic basis, if he is receiving a salary for his annual services of $600." From this point of view, music pays probably as well, on the average, as most vocations.

Every chorus singer has a chance to become a Sembrich, an Eames, or a Nordica, a Caruso or a Knote. The rewards of success in music are, indeed, so great that it is a wonder that so few men compete for them. In some departments women have things almost entirely their own way; yet a prominent woman teacher complained, not long ago, that musical students of both sexes seemed more and more inclined to go to men for lessons. In London, the members of the orchestras used to be largely Germans; now, the German-visiting conductors have to address them in English, which shows that the prejudice that so long kept men out of music is passing away. In view of the fortunes won by such artists as Paderewski, Jean de Reszke, Tamagno, Johann and Richard Strauss, Arthur Sullivan, and Victor Herbert, American men may well ask themselves whether music does not pay better than they had supposed.

THE MOROCCO CONFERENCE.

To judge merely by the published *agenda* of the forthcoming Morocco Conference, there is no occasion whatever for the nervousness, amounting almost to apprehension, with which it is regarded in Europe. Wars and rumors of war fill the air. It is a "critical situation," declares the London *Times*, and adds: "Is this the moment when British statesmen, philanthropists, and chambers of commerce seriously believe they serve the cause of peace by falling on the necks of our German cousins and embracing them?" This is obviously a fling at Campbell-Bannerman's announced policy of seeking the friendliest relations with Germany; and, for the rest, is in keeping with the rôle of international stabber which the *Times* seems lately to have taken up. But it cannot be denied that many who do not, like it, prostrate themselves at the altar of the great god Jingo every day, yet feel that a great international peril, if not a threat of war, lurks in the conference called to deal with Moroccan affairs.

Its official programme, however, is the most peaceful-looking document imaginable. From the text of the agreement signed by France and Germany on September 28, we learn that the Conference on Moroccan affairs is to discuss the organization of the police; the repression of contraband trade, particularly in arms; financial reforms; and finally the "establishment of principles calculated to safeguard economic liberty." Certain rights of France to police the frontier are reserved, as are also certain commitments of German bankers as respects loans for public improvements in Morocco. Here, certainly, is no appearance of fighting matter.

It is really, of course, in jealousies and collisions extraneous to the Conference proper that the danger lies. In May and June last, the tension between Germany and France was undeniably acute. Even since the *accord* was signed in September, many clouds have risen upon the horizon. Military preparations have quietly been made on both sides of the Franco-German frontier. The press of either country has been suspicious and provocative. Public statements of an official character, in both Berlin and Paris, have not been wholly reassuring. On December 14 the French Government published a "Yellow Book" on the Morocco question, covering the diplomatic correspondence from 1901. It revealed a steadily heightened difference, culminating in the resignation of the French Minister for Foreign Affairs, M. Delcassé, with the solemn warning of Chancellor von Bülow to France "not to delay in a path lined with precipices and even abysses." The most directly damaging part of the correspondence, as published, affected the activities of Count Tattenbach, the German agent at Tangier, who appears to be proved guilty of double-dealing and deception. It is stated, however, that the documents about to be published by the German Government will exculpate the accused Count; so it is but fair to suspend judgment in his case. Also, it should be noted, Germany is submitting some important documents to the French Government confidentially.

If our information is not at fault, another confidential communication was

made by the German Government two or three years ago, not only to France, but to all the European chancelleries, which has a highly important bearing upon the whole controversy. This was an official notification that, when the affairs of Morocco came to be settled, Germany expected to be consulted. If this be true, and we have the best of reasons for so believing it, the "interference" of the German Emperor last spring wears an entirely new aspect. M. Delcassé's diplomacy seemed distinctly aimed at isolating Germany. The *entente* which he negotiated with England was, in the main, a skilful and useful agreement, but one clause of it stipulated that France, so far as England was concerned, might have a free hand in Morocco. Circumstances being what they were, this could be taken only as an affront to Germany. Her protest in advance had been coolly disregarded by M. Delcassé. Her interests in Morocco, as well as her rights as one of the signatories of the Madrid treaty relating to Morocco, she saw ignored—or, at any rate, in the way of being ignored. Human nature being what it is, and German pride what we know it, nothing was to have been expected but such a demonstration as the Kaiser made in his trip to Tangier, or such a dead-set as German diplomacy made at M. Delcassé. The result was that he had to leave office, in spite of his great services and high prestige, amid a feeling on the part of the soberest men in France, including the Prime Minister and most of the Cabinet, that he had made a grave blunder.

Such things rankle in the public mind, however; and it is the persistence of the bitterness which the Delcassé incident evoked which accounts, we believe, for most of the disquietude. But we cannot think it justified. Neither France nor Germany desires a war which would be as causeless, and probably as fruitless, as it would be terrible. In themselves, the questions to come before the Conference are not so insoluble as to cause despondency over the outlook. What the United States is doing in that Moroccan galley is a source of wonder to some. The fantastic explanation from Washington, that our historic bombardments of the Barbary pirates entitle us to a place in the Conference, can hardly be received with gravity by European diplomats, however good their control of their facial muscles. They will, we presume, attribute President Roosevelt's dispatch of envoys to his feeling that, having helped arrange the Conference, he should help give it dignity; and also to his ardent desire to sustain freedom of trade—abroad.

JOHN BARTLETT.

In every university town such as Cambridge, Mass., there is an outside circle, beyond the institution itself, of cultivated men who may or may not hold its degrees, but who contribute to the intellectual atmosphere. One of the most widely known and generally useful of these at Cambridge—whether in his active youth or in the patient and lonely seclusion of his later years—was John Bartlett, best known as the author of the dictionary entitled 'Familiar Quotations.'

He was born in Plymouth, June 14, 1820, was educated in the public schools of that town, and in 1836 entered the bookbinding establishment connected with the University bookstore in Cambridge, under John Owen, who was Longfellow's first publisher. In the next year Bartlett became a clerk in the bookstore, and soon showed remarkable talent for the business. In 1846 Mr. Owen failed, and Bartlett remained with his successor, George Nichols, but became himself the proprietor in 1849. He had shown himself in this position an uncommonly good publisher and adviser of authors. He had there published three editions of his 'Familiar Quotations,' gradually enlarging the book from the beginning. In 1859 he sold out to Sever & Francis. In 1862 he served as volunteer naval paymaster for nine months with Capt. Boutelle, his brother-in-law, on board Admiral DuPont's dispatch-boat. In August, 1863, he entered the publishing house of Little, Brown & Co., nominally as clerk, but with the promise that in eighteen months, when the existing partnership would end, he should be taken into the firm, which accordingly took place in 1865. The fourth edition of his 'Familiar Quotations,' always growing larger, had meanwhile been published by them, as well as an *édition de luxe* of Walton's 'Complete Angler,' in the preparation of which he made an especial and exceptionally fine collection of works on angling, which he afterwards presented to the Harvard College Library. His activity in the Waltonian sport is also commemorated in Lowell's poem, "To Mr. John Bartlett, who had sent me a seven-pound trout." He gave to the Library at the same time another collection of books containing "Proverbs," and still another on "Emblems."

After his becoming partner in the firm, the literary, manufacturing, and advertising departments were assigned to him, and were retained until he withdrew altogether. The fifth and sixth editions of his 'Quotations' were published by Little, Brown & Co., the seventh and eighth by Routledge of London, the ninth by Little, Brown & Co. and Macmillan & Co. of London, jointly; and of all these editions between two and three hundred thousand copies must have been sold. Of the seventh and eighth editions, as the author himself tells us, forty thousand copies were printed apart from the English reprint. The ninth edition, published in 1891, had three hundred and fifty pages more than its predecessor, and the index was increased by more than ten thousand lines. In 1881 Mr. Bartlett published his Shakspere 'Phrase-Book,' and in February, 1889, he retired from his firm to complete his indispensable Shakspere "Concordance," which Macmillan & Co. published at their own risk in London in 1894.

All this immense literary work had the direct support and coöperation of Mr. Bartlett's wife, who was the daughter of Sidney Willard, professor of Hebrew in Harvard University, and grand-daughter of Joseph Willard, president of Harvard from 1781 to 1804. She inherited from such an ancestry the love of studious labor; and, as they had no children, she and her husband could pursue it with the greatest regularity. Both of them had, also, been great readers for many years, and there is still extant a manuscript book of John Bartlett's which surpasses most books to be found in these days, for it contains the lifelong record of his reading. What man or woman, now living, for instance, can claim to have read Gibbon's 'Decline and Fall' faithfully through, four times, from beginning to end? We must, however, remember that this was accomplished by one who began by reading a verse of the Bible aloud to his mother when he was but three years old, and had gone through the whole of it at nine.

There came, however, an event in Bartlett's life which put an end to all direct labors, when his wife and co-worker began to lose her mental clearness, and all this joint task had presently to be laid aside. For a time, he tried to continue his work unaided; and she, with unwearied patience and gentleness, would sit quietly beside him without interference. But the malady increased until she passed into that melancholy condition described so powerfully by his neighbor and intimate friend, James Russell Lowell—though drawing from a different example—in his poem of "The Darkened Mind." While Bartlett still continued his habit of reading, the writing had to be surrendered. His eyesight being ere long affected, the reading also was abandoned, and after his wife's death he lived for a year or two one of the loneliest of lives. He grew physically lame, and could scarcely cross the room unaided. A nervous trouble in the head left him able to employ a reader less and less frequently, and finally not at all. In a large and homelike room containing one of the most charming private libraries in Cambridge—the books being beautifully bound and lighting up the walls instead of darkening them—he spent most of the day reclining on the sofa, externally unemployed, simply because employment was impossible. He had occasional visitors, and four of his old friends formed what they called a "Bartlett Club" and met at his house one evening in every week. Sometimes days passed, however, without his receiving a visitor, he living alone in a room once gay with the whist parties which he and Lowell had formerly organized and carried on.

His cheerful courage, however, was absolutely unbroken, and he met every casual guest with a look of sunshine. His voice and manner, always animated and cheerful, remained almost the same. He had an inexhaustible store of anecdotes and reminiscence, and could fill the hour with talk without showing exhaustion. Seldom going out of the house, unable to take more than very short drives, he dwelt absolutely in the past, remembered the ways and deeds of all Cambridge and Boston literary men, spoke genially of all and with malice of none. He had an endless fund of good stories of personal experience. Were one to speak to him, for instance, of Edward Everett, well known for the elaboration with which he prepared his addresses, Bartlett would instantly recall how Everett once came into

his bookstore in search of a small pocket Bible, to be produced dramatically before a rural audience at a proper time in a lecture; but, this case finding none small enough, chose a copy of Hoyle's "Games" to be produced instead, at the important moment. Then he would describe the same Edward Everett whom he once called upon and found busy in drilling a few Revolutionary soldiers who were to be on the platform during Everett's famous Concord oration, and whom he drilled first to stand up and be admired at a certain point in the oration, and then to sit down again, by signal, that the audience might rather rise in their honor. Unfortunately, one man, who was totally deaf, forgot the instruction and absolutely refused to sit down, because "the squire" had told him to stand up. In a similar way, Bartlett's unimpaired memory held the whole circle of eminent men among whom he had grown up from youth, and a casual visitor might infer from his cheery manner that these comrades had just left the room. During his last illness, mind and memory seemed equally unclouded until the very end, and almost the last words he spoke were a caution to his faithful nurse not to forget to pay the small sum due to a man who had been at work on his driveway, he naming the precise sum due in dollars and cents.

He died on the morning of December 3, 1905, aged eighty-five. Was his career, after all, more to be pitied or envied? He lived a life of prolonged and happy labor among the very choicest gems of human thought; and died with patient fortitude, after all visible human joys had long been laid aside.

JOINT MEETINGS OF HUMANISTS AT ITHACA.

ITHACA, N. Y., December 30, 1905.

The attendance at the joint meetings at Cornell University, on December 26-29, of the Archæological Institute of America, the American Philological Association, and the American Anthropological Association was larger than at any like meeting since the first American Congress of Philologists, which was devoted to the memory of the late Professor Whitney, and was held in Philadelphia in December, 1894. The temporary union of the three organizations was natural and convenient, since most of the classical archæologists are members of the Philological Association, and the most prominent anthropologists are members also of the Archæological Institute. It is understood that the three bodies will meet together again next year, in Washington, in the Christmas holidays.

The arrangements for the recent meeting were satisfactory in every way. In bad weather the distance of the hotels from the halls of meeting might have been disagreeable, but, with the exception of a single evening, the skies were bright and the air mild. The University was most hospitable. Its buildings were thrown open for the meetings of the associations, and the visitors were invited to luncheon each day in Sage College. Ex-President White, in a charming address of greeting, took occasion to correct a more or less prevalent belief in the early hostility of Cornell University and State universities generally to humanistic studies. President Schurmann not only offered a formal welcome, in eloquent and thoughtful words emphasizing the worth of the studies of humanity which the associations represented, but also gave at his own house a reception which, with the luncheons at Sage College, supplied the opportunity for the social element which is always important in such gatherings. A "smoker" at the Town and Gown Club served for a still more informal meeting of the men. The programmes had been arranged so skilfully that the speakers were not hurried, and time was allowed for discussion. That no one could be present in two meetings at the same moment, had to be accepted as the result of a physical law, though often regretted.

More papers than usual were notable as being more than merely learned and scholarly. One of the most interesting was on the East Front of the Erechtheum by Mr. Gorham P. Stevens of New York, recently for two years Fellow in Architecture of the American School of Classical Studies at Athens, whose drawings of the Erechtheum attracted much attention at the Archæological Congress held in Athens last spring. He proved most ingeniously and convincingly that this temple had on its east front two windows, the existence of which had not before been suspected, and he showed also the shape, size, and decoration of these windows, and their relation to the door. Similar in its ingenuity and convincing quality was the discussion of a noted so-called Hecatompedon inscription, by Mr. B. H. Hill of the Boston Museum of Fine Arts. He showed that the order of the two stones which bear this inscription has been mistaken hitherto, and that nine of the eleven known fragments of the second stone can be assigned to their proper relative places. These papers would have been notable if they had been read before the Berlin Academy of Sciences or any other learned body. Professor Prentice of Princeton University presented an interesting paper on Magic on Lintels and Amulets, interpreting some late Greek inscriptions which appeared unintelligible—explaining some letters as initials of familiar words, and showing other groups to be cryptic substitutes for words in which the Greek letters, taken together, had the same numerical value. Dr. Caroline L. Ransom of Bryn Mawr College, who has recently come to be a high authority on classical furniture, discussed Egyptian stools, chairs, and couches, showing the tendency to give these articles of furniture legs in the shape of animals' legs, as if the chair or couch were walking, and correcting the restorations in several museums, where the legs of the furniture appear to be walking in different directions.

The paper by Professor Burt G. Wilder of Cornell University on the Nomenclature of the Brain was one of the most important of those read before the Philological Association. But no synoptical report of all the papers read can be attempted here, and the highly finished Annual Address of Professor Herbert Weir Smyth of Harvard University, President of the Philological Association, cannot satisfactorily be given in summary. This called attention in particular to the conservative elements in Greek literature and life. Miss Alice Fletcher of Washington, who was to have given the presidential address before the Anthropological Association, unfortunately was detained by illness.

Before a joint meeting of the three associations Prof. E. L. Hewett of Washington presented a careful and authoritative statement of the measures recently adopted by departments of the United States Government for the preservation of American antiquities, and indicated the line of legislation which is desirable. The Committee on the Preservation of the Remains of American Antiquity joined with the Council of the Archæological Institute in approving measures for the preservation of the Mesa Verde remains in Colorado, for the safety of which the Cliff Dwellers' Association has long been laboring.

Professor Elmer T. Merrill of Trinity College was elected President of the Philological Association. The officers of the Archæological Institute and its affiliated Schools of Classical Studies in general were reëlected or held over. But Prof. John H. Wright of Harvard University offered his resignation of the editorship of the Journal of the Institute (the *American Journal of Archæology*), which he has conducted with signal ability and success for nine years. He will edit also, it is hoped, the forthcoming volume of the *Journal*. His successor was not elected. The question of the reconstruction of the editorial committee of the Institute is complicated because of the variety of its publications. A second volume of Supplementary Papers of the School in Rome, a Bulletin of the School at Athens, with an account of the excavations of the last ten years on the site of ancient Corinth, an elaborate illustrated report of Dr. Tozzer, who has been for four years the Institute's Fellow in American Archæology, pursuing researches in Central America, and, not least, Professor Frothingham's great work on the Arch at Beneventum, are only the most important of the publications which the Institute has in readiness for the printer.

The Council passed a complimentary resolution with regard to Prof. W. H. Goodyear's architectural surveys of mediæval buildings. The Archæological Society at Cincinnati was accepted as an affiliated society of the Institute, and similar societies in St. Louis, Kansas City, Indianapolis, and other cities, which were reported as in process of organization, will be accepted on their complying with certain conditions. The statement that $100,000 had been secured as an endowment fund for the School in Rome was received with great pleasure. This fund is almost exactly the same as that of the School at Athens. The income from these funds, naturally, is far from sufficient to meet the necessary expenses of these schools. Most of the necessary income still is derived from annual contributions, chiefly from colleges and graduates of colleges, but the Managing Committees are glad to have at least a considerable part of the necessary income assured. Probably no institutions in the country, with like means, during recent years, have accomplished more important work for the higher education than these schools at Athens and in Rome. The most important item in the report of the School in Palestine was that the headquarters of the School were no longer to be in the Grand Hotel at Jerusalem, but that a suitable building had been secured.

At the opening of the meeting of the Managing Committee of the School at Athens, a brief and informal address was made in memory of the late Director of the School, Dr. Theodore Woolsey Heermance, who died in Athens at the close of last September, and sympathetic letters were read from foreign scholars, full of high appreciation of his work. No successor to Dr. Heermance was appointed, but this appointment, with certain instructions and limitations, was entrusted to a special committee.

THE AMERICAN POLITICAL SCIENCE ASSOCIATION.

BALTIMORE, December 30, 1905.

The opening sessions of the Political Science and of the Historical Associations were held jointly on Tuesday evening, December 26, and were devoted to the address of welcome by President Remsen of Johns Hopkins University and the presidential addresses of Professor McMaster of the Historical Association and Professor Goodnow of the Political Science Association. President Goodnow took as his subject "The Growth of Administrative Discretion in the United States." After calling attention to the fact that a marked characteristic of English and American governmental polity, as compared with that of Continental systems, is the subjection of administrative officials to the control of the judiciary, Professor Goodnow dwelt upon the marked tendency of our courts in recent years to recognize the constitutionality of legislative acts granting great discretionary powers to those entrusted with the execution of the laws. As a conspicuous instance, he cited the decision of the Supreme Court of the United States upholding the validity of the Act of Congress which renders final the determinations of administrative officials with regard to the circumstances justifying the deportation of persons of Chinese descent, even though such persons claim to be native-born American citizens. This tendency to increase administrative powers the speaker showed to be caused and justified by the necessity for greater administrative efficiency if the governmental tasks of our present complex social and industrial life are to be satisfactorily performed. It is, therefore, a development which is not to be deprecated, even though it be away from the political ideas of the fathers of the Constitution. But, together with this increase of administrative powers which he thus approved, Professor Goodnow was careful to point out the correspondingly greater necessity of keeping purely administrative and technical matters beyond the control of partisan politics.

The second session, that of Wednesday morning, was largely devoted to a discussion of "Suffrage Conditions in the South"; Prof. Albert Bushnell Hart of Harvard University considering the question from the historical and political points of view, and Mr. John C. Rose, United States District Attorney of Baltimore, examining it in its constitutional aspects. Mr. Rose emphasized especially the fact that the Southern States have been able so successfully to disfranchise their adult male negroes, the Fifteenth Amendment to the contrary notwithstanding, not so much because of the limited powers of the general Government, as because Congress has not seen fit to exercise the constitutional powers which it has. Yet doubt was expressed whether, should those powers be exercised to their fullest extent, the negroes would profit by it. Certain formal legal rights would thus be secured to them, but only at the cost of increased racial animosities and social and economic discrimination against them. The reading of the papers was followed by a vigorous discussion of the topic, Mr. H. E. Shepherd presenting the Southern point of view with especial vehemence. Mr. J. T. Stephenson of Pendleton, N. C., admirably supplemented the principal papers by an account of racial distinctions in general as found in Southern statute law since the civil war. The morning session was concluded by a paper from Mr. George L. Fox of the University School, New Haven, on the subject of "Corrupt-Practices-at-Elections Acts since 1890 in the United States." Mr. Fox has for some years taken a very active part in the movement for purifying politics in his own State, and drafted the bill which was recently before the Connecticut Legislature. The conclusion which he drew from his personal experience and from his study of the experiences of other States, was that while such corrupt-practices acts as had been passed had in large measure remained dead-letter laws, there was no insuperable or even very serious difficulty in enforcing them when well drawn and supported by a strong public opinion.

The afternoon session of Wednesday was devoted to International Law and Diplomacy, the papers in the main centring around the recent great international drama in the East. Professor Latané of Washington and Lee University read a paper on "The Use of Neutral Waters by Belligerents," in which he showed the great divergence between the strict views upon this matter held by England and the United States, and the very lax ones held and practised by France. Prof. Amos S. Hershey of the University of Indiana, in an interesting paper, dwelt upon the extent to which recent events, especially those of the Far East, have resulted in still further increasing that friendship between England and the United States which England's attitude during the Spanish-American war so greatly stimulated. The concluding paper at this session was by Judge Simeon E. Baldwin, who compared the results of the Montevideo Congress of the seven South American Powers in 1888 with those of the Hague Conferences of most of the European nations in 1893, 1894, 1900, and 1904. The Montevideo Congress attempted a complete codification and dealt with universal rules, and its conclusions have been ratified by but a few Powers. The Hague Conferences more wisely confined their attention to a few subjects, such as marriage, guardianship, etc., and their conclusions upon them have been ratified by most of the European States. Mr. Arthur K. Kuhn of the New York bar, in discussing Judge Baldwin's paper, adverted to the extent to which American citizens are often hampered by local rules against aliens in litigating in European countries, and urged that, to correct this evil, as well as for other reasons, the United States should no longer keep aloof from the efforts that European nations are making to harmonize, upon particular points at least, their respective systems of civil jurisprudence.

The meeting of Thursday morning was a joint session with the American Economic Association, the subject for discussion being "The Municipal Ownership of Public Utilities." The principal papers were read by Mr. F. C. Howe of Cleveland, O., and Prof. W. M. Daniels of Princeton University. Mr. Howe emphasized the advantages to be obtained from municipal ownership. The real question he declared to be not a commercial one, but one of democratic government, inasmuch as it is the corrupting influence of private franchises that is responsible for most of the corruption in our city politics. Professor Daniels, on the other hand, doubted whether the economy of municipal ownership has as yet been sufficiently demonstrated; and, as regards the purification of politics, was inclined to lay greater stress upon a better organization of city governments.

"The cure for our economic ills is to be found primarily in a political readjustment of the framework of city government. As I view the matter, there is no escape under a representative government from reposing responsibility in some person or persons. Let political responsibility be undivided, and let it be located so clearly that concealment is impossible; let the task of cashiering the dishonest or the incapable administrator or legislator be stripped of all indirection or subterfuge, and reduced to the greatest simplicity possible by a radical cut in the number of elected officials—and the choice between municipalization or a franchise policy becomes the comparatively simple question of the relative advantages of widening public control or of enlarging governmental administration."

At the session of Thursday afternoon, four papers dealing with different questions of politics were read. Miss Mary L. Hinsdale of Radcliffe College considered the history of the efforts that from time to time have been made to obtain admission of the heads of executive departments to the floor of Congress. Mr. Theodore Marburg of Baltimore presented a philosophical discussion of the principles of State interference. Whereas, in former years, liberty meant freedom of the individual from restraint by the State, it now often means State interference to protect the individual against oppression by others. Mr. Henry Jones Ford of Baltimore, in a vigorous paper, criticised those political scientists who, like Professor Burgess, would limit the scope of their inquiries to the analysis of the developed States of Europe and North America, thus excluding from study the very States—China, Russia, and Turkey—whose activities are at the present day the centres of disturbance in world politics. The last paper of the meeting was read by Mr. A. Maurice Low, who took for his topic "The Usurped Powers of the Senate." The usurpations upon which he particularly dwelt were the control that the upper house of Congress has gained in the matter of dictating Presidential appointments, or amending treaties and even of participating in their negotiations, and of the control of both revenue and appropriation bills.

Thursday evening was devoted to informal meetings of two of the various "Sections" which have been organized within the Political Science Association. The business meeting of the Association and the election of officers took place on Friday morning. The chief matter of business discussed was the future policy of the

Association in the matter of publications. A strong sentiment in favor of the issuance by the Association of a quarterly journal was manifested, and a committee was appointed to consider the feasibility of the project, and thereupon to take the steps necessary for its realization. Dr. Albert Shaw of New York City was elected President of the Association, Prof. Albert Bushnell Hart, Mr. F. N. Judson, and Prof. H. A. Garfield, Vice-Presidents, and Prof. W. W. Willoughby of Johns Hopkins University, Secretary and Treasurer. Providence, R. I., was selected as the place for the next annual meeting. W. W. W.

AFTER TWENTY YEARS OF RESOLUTE GOVERNMENT.

DUBLIN, December 16, 1905.

The "twenty years of resolute governernment" which, according to Lord Salisbury, would settle the Irish question, have more than passed. Mr. Gladstone, Mr. Parnell, Lord Salishury, have gone to their rest. Home Rule holds a place in the hearts of Irishmen much as it did twenty years ago. The demand for it is not accompanied by violence and disorder; therefore Englishmen do not now feel its necessity. A Liberal Ministry is in office. Lord Aberdeen has returned as Lord Lieutenant. There is none of the enthusiasm here that there was twenty years ago, when Mr. Gladstone and his party were in power. It is true that Mr. Morley, Mr. Bryce, and others who have ever since and all along shown the clearest conception of the necessity for radical change in Irish affairs, are now in the Ministry; but, as I have intimated, they are not backed by the enthusiasm that prevailed in England in the eighties. On both sides of the Channel we are older and graver. Seeing the peace which prevails here, the creditable manner in which county and local government committed to the people has been managed, and the better knowledge that prevails of the country through its having been opened up as a tourist resort, it is impossible that the former fierce opposition to Home Rule, based on the essentially iniquitous character of our people, could be maintained. On the other hand, the attitude of our Members towards the education question in England has left a soreness in the hearts of our English Liberal friends that is not likely ever to be fully eradicated. Here in Ireland, although Home Rule theoretically holds its old place and as many Members as formerly are pledged thereto, the inclination to sacrifice much for it has somewhat cooled. Local government and land legislation have satisfied many. There is less belief here than of old in any one measure, or any number of measures, affording a cure for all our ills. It is much to be doubted whether ecclesiasticism is really in favor of radical change; and the liquor interest, a powerful factor, alas! in our politics, better organized than formerly, cares more for itself than for the general good of the country.

Ireland, such as is left of it, though more shaded in opinion, its energies less concentrated and united towards one aim than in Mr. Parnell's time, is more generally really alive than then. Education has been doing its work. The Gaelic League has been an important influence for good in the country, giving the rising generation, male and female, other opportunities of showing their love for Ireland than by attending political meetings and swallowing all there uttered. We are not likely ever again in Ireland to find men wielding such unquestioned power as did O'Connell and Parnell. A section of Orangemen, while professing themselves still opposed to Home Rule, are coming to lose their dread of their Catholic fellow-countrymen, and to see that their mundane interests are identical. There is, perhaps, a more general opinion than ever before pervading all classes in the community that the present Castle régime must be changed. The workings of different land laws, of a different system of county government and education, the absence of an Established Church, render it more and more impossible for Englishmen to understand our affairs and legislate for us. Under Mr. Parnell's rule, the open expression of separatist opinion merged in the immediate hope of some form of nationality. A not insignificant body of our young men—their sentiments voiced in the columns of an able weekly, the *United Irishman*—now argue in favor of separation from England, at least on the Austro-Hungarian model, as the only satisfactory settlement. They heap ridicule on the Parliamentary party, and stigmatize Gladstonian Home Rule as but shadowy nationality.

It is best that these opinions should be openly expressed—that Englishmen should realize that Home Rulers are, in truth, the moderates. There is little doubt that, under a satisfactory settlement, such feelings would die out, as they did in Canada and Australia. Left to the management of our own affairs, the advantages of the connection are too patent not to be realized. We in Ireland have no record of self-centred nationality to hark back to, as there was in Italy, Hungary, Poland, and Finland, and as there is in Scotland. The unions existing between Sweden and Norway, and Austria and Hungary, were never of the clearly defined, incorporating character of the union Ireland generally would be willing to accept. It is unfortunate that, in the discussions of ten and twenty years ago, the connections of Norway-Sweden and Austria-Hungary were cited in favor of the union then contemplated between England and Ireland. Sweden and Norway have separated; there is a chronic state of unrest between Austria and Hungary. The Unionists are now naturally pointing with effect to the dénouement between those countries as the one certain result from material alteration in the present relations of England and Ireland.

Unity in political action is Ireland's only chance. There has, it is true, during the last hundred years been as much political union here as in other countries, but the majority has never occupied an official position where it could make itself respected. Therefore parties here always appear inchoate, and the least difference of opinion is put down to an ineradicable weakness in our character. At our corporations and public boards, in the management of our railways and commercial undertakings, there are no more serious differences of opinion than in other countries. The majorities rule, and we consequently hear nothing of their underlying disagreements. There are few instances of a country showing itself so generally united as Ireland, electing as it has done for the last quarter of a century a steady majority of four to one in favor of a particular measure. More striking still is the fact that four-fifths of her representatives, most of them poor men, many of them very able men, have resisted all the blandishments of London life and Government patronage, and have stoutly preserved their independence. All but Irish Nationalists who enter Parliament are sustained by the inspiring possibility of attaining Cabinet rank, of receiving titles, or securing lucrative settlements for life.

One of the strangest transformations that have ever occurred in public life has been performed by William O'Brien, once the spoiled darling of the Irish people, the embodiment of the idea of unity and discipline, the reuniter of parties after the Parnell split, the founder of the United Irish League. Two years ago he differed from three-fourths of his colleagues, including the ablest of them, upon a question of policy. He "retired from public life," "effaced himself," stopped the issue and sold off the plant of his paper, the *Irish People*. This "retirement" and "effacement" soon resolved themselves into a torrent of speech and oceans of print in virulent abuse of his old friends and comrades. He has, under the name of an "advisory committee," started what is in truth an organization in opposition to the League, and influenced a Parliamentary coterie apart from Mr. Redmond. He has now recommenced the publication of the *Irish People*. Through his marriage with a wealthy Russian lady he has large resources at command. There is no saying what trouble he may give in the coming elections.

To brace Ireland up for the election, to test the strength of Mr. O'Brien's following, to define the policy of the country, a convention was lately held under the presidency of Mr. Redmond and the Lord Mayor, in the Mansion House, Dublin—in the fine circular chamber built for the reception of George IV. in 1820, and mentioned in Byron's "Irish Avatar." Over 3,000 delegates attended from most parts of Ireland—a smaller proportion of them than usual from the south, where Mr. O'Brien's influence most prevails. It impressed me as the most representative and the weightiest of the conventions that have been held in Ireland during the past thirty years. The establishment of elective county, district, and urban councils has brought a larger proportion of thoughtful and responsible men to the front. Eleven hundred of the delegates were of this class. Sixty-three Irish members were present, and nearly three hundred Catholic clergy. There was a sprinkling of Protestants. The proceedings lasted two days and were harmonious. But one person spoke, and no one voted, in favor of Mr. O'Brien's proposals. Gladstonian Home Rule, as an "irreducible minimum," was demanded. The usual popular measures concerning land, laborers' dwellings, and education were ventilated.

Irish politicians are satisfied with Campbell-Bannerman's declarations so far. They have, however, been chilled by the admissions of Mr. Morley and others, whom they

most depended upon, that the Irish question in its wide sense is not now pressing. Mr. Bryce is one of Ireland's most convinced friends. Many regret that he is coming over as Chief Secretary. In the administration of the present hateful system, which he condemns, he can scarcely avoid finding himself in an unpopular position. There is some danger of opponents of a reasonable settlement setting pitfalls for him. It is possible that a man of such refined feelings, of such a literary and abstract turn of mind, may be disgusted and alienated by the rough necessities of his new responsibilities. William E. Forster would most probably have continued to follow Mr. Gladstone's lead in Irish affairs had he not been thrown in opposition, partly through the influence of the permanent officials through whom he worked in the same post that Mr. Bryce now fills.

It is unlikely that the full measure of Irish desires, such as Mr. Gladstone offered, can or will soon again be proposed by the Liberal party. All that can reasonably be expected at first is, that they will give themselves seriously to the passage of wide measures of devolution, such as handing over the principal Castle boards to an elective assembly, having at its disposal a definite portion of revenue drawn from Ireland. Without abating their conviction of the necessity of a more radical settlement, the Irish party could not refuse to support a Government that initiated changes which in their estimation would tend towards and prepare for a complete settlement. If, when Parliament meets, such are not promised or taken in hand, there is likely to be trouble between the Liberals and their former Irish allies. A good beginning is not being made in the retention as Vice-President of one of the principal Irish boards of Sir Horace Plunkett, who has not commended himself to national feeling.

Ireland has no desire to run the risk of further alienation from the Liberals on behalf of the English Catholics concerning education or otherwise. She may, however, through clerical influence, be driven into it. If this should happen, the relations between us and the Liberals may become more complicated even than at present.

Before closing, I may note an incident illustrative of the extraordinary character of Irish Castle government. Mr. Downes Martin, a Tipperary landlord, and his tenants have agreed as to the sale and purchase of an estate. It appears that the Castle had issued private instructions to the Estates Commissioners that wherever there was supposed to be intimidation on the part of the tenants, sales were to be indefinitely postponed. Two policemen have sworn that there was intimidation in this case. The landlord, his agent, and the tenants, all declare there had been none, that the arrangements between them had been freely and openly come to. The two policemen are believed, and the sale of the estate against the desires and to the loss of both landlord and tenants is broken off.

D. B.

LAMARTINE'S MARRIAGE.

PARIS, December 21, 1905.

Lamartine's reputation as a poet was made almost in a day; he could say, as was said of Byron, that he lay down and woke up famous. The 'Méditations,' which will be read as long as a French language lasts, were published in 1820. We know now, in all its details, the story of the relations of young Lamartine with Madame Charles, who was his inspirer; we know what influence this lady had upon him, and to this influence we may attribute the purity of the 'Méditations.' After her death, Lamartine was inconsolable, and it may be affirmed that he never again cherished the dream which he had cherished with Madame Charles in the solitude of Savoy. The 'Lac' will remain undying testimony to the character of the lofty passion of the young poet and of his inspirer.

The year which followed the death of the woman whom Lamartine has made immortal under the name of Elvire was the most unhappy of his life. He was entering on his twenty-ninth year; he had no object, no profession, no fortune. His family, on account of his delicate health, had prevented him from entering the army; literature was not, in those times, considered a paying profession; he had tried to enter the diplomatic service, but, so far, had not been successful; he spent most of his time at Milly, in the neighborhood of Macon. He fell ill towards the beginning of 1819, and went to Paris, to get medical advice. He was invited to several houses, where he recited some of his verses; he was handsome, had a melancholy and poetical face —his person had as great a success as his verses; but he received no encouragement from the Foreign Office, and he left, very much discouraged, for Aix-les-Bains with his friend Aymon de Virieu, in August, 1819.

He met there a young Englishwoman, whom he had seen already at Chambéry; he had forgotten her, but she had not forgotten him. Marian Eliza Birch was the only daughter of William Henry Birch and of Christina Cordelia Reessen. The father was dead, and she was living with her mother at Chambéry in Savoy. Lamartine first saw her there; she had heard much about him at the house of some French friends, and had heard him recite some of his verses. She became enthusiastic over him. She was twenty-nine years old, and when they saw each other again at Aix, their acquaintance rapidly became intimate.

Among the family papers which are kept in the Château of Saint-Point was found an envelope bearing this superscription in the hand of Mme. de Lamartine: "Letters of the year 1820, on my marriage." The envelope contains all the letters which the poet wrote for months to his future wife, from the time when he declared his love to her to the day of their marriage. There is found, besides, the official letter in which Lamartine's father asks for the hand of Miss Birch for his son. The correspondence, so carefully preserved, was at first secret. The first letter bears this endorsement: "Alphonse, Aix, 14th August, 1819"; it is a proposal of marriage. "I would beg you not to judge with severity the means which necessity forces me to take, and to read this letter to the end." It is clear from this beginning that Lamartine had received no encouragement from the mother of Miss Birch; in fact, after having declared his love, he says:

"We shall probably find on both sides obstacles of equal force, but no obstacle will be as strong as the sentiment which guides me. This sentiment, which I have known once in my life, could be torn from my heart only by the loss of what I loved. Since that time I have lived in a state of perfect indifference; but I have made your acquaintance, I have found in you so many perfect qualities, so much similarity between our tastes and feelings, so many perfections unknown perhaps to yourself, that I feel that I should be the happiest of men in uniting my days and destiny with yours."

The answer to this letter was not unfavorable, notwithstanding the efforts made by a friend of Miss Birch, Mademoiselle de la Pierre, who tried to hinder Miss Birch from getting engaged to Lamartine, and reminded her of his passion for Madame Charles. Mademoiselle de la Pierre represented Lamartine as a selfish man, who cared for nothing but her fortune. Long letters were written by Lamartine to Miss Birch in answer to the insinuations of Mademoiselle de la Pierre, and, after some hesitation, Miss Birch wrote to him a letter which was a formal promise.

There arose now a more difficult question, namely, to obtain the consent of the two families to the marriage. Lamartine had returned to Milly, where he unbosomed himself to his mother. Madame de Lamartine was anxious to see her son married, but Miss Birch was a Protestant; the brother-in-law and sisters-in-law of Madame de Lamartine, with whom she was anxious to be on the best of terms, were pious Catholics, and did not view with favor a union with a foreigner. They looked upon their nephew's project as too romantic and risky. Notwithstanding these difficulties, M. de Lamartine, the father, wrote on the 21st of September an official letter asking the hand of Miss Birch for his son. Mrs. Birch was still at Chambéry; Lamartine himself wrote also to her on the 26th of September, "in order to try to dissipate the unfavorable impressions which might perhaps be created in her mind by the differences of country and religion, and to allay the fear, so natural, of separation from what was dearest to her." He offered not only to live with her, but to spend a part of the year in England. Mrs. Birch sent, by return post, an answer to these two letters; it was a somewhat harsh and very decided refusal. She had evidently the impression that Lamartine was seeking for her fortune, and wrote: "My fortune is not considerable, and my daughter will have nothing in my lifetime but what I may give her." Moreover, in her answer to Lamartine, she insisted upon the fact that he had no employment and very little fortune.

The formal opposition of her parent did not discourage Miss Birch; her mind was fixed, and she continued to correspond with Lamartine. "All my sorrows were forgotten," he wrote on the 22d of November, 1819, "the day I read that your sentiments had not altered, and that you had no part in the refusals which my family has received." He goes on to say that he had foreseen

that the question of his fortune would become a difficulty, and he adds:

"It is well that you should know exactly my position in this respect, as I have frankly set it before your mother. My family comes from good and ancient gentry, occupying by its origin and its fortune the first rank in its province. My father is the youngest of six children, having two brothers and three sisters; he alone is married. The totality of the fortune is about equally divided between all; this fortune, which, naturally as well as by their authentic intentions, reverts entirely to my sisters and myself, amounts to at least thirteen hundred thousand francs in land. . . . The declared intention of my parents, who live in the most perfect union, is that each of my sisters shall one day have one hundred and fifty thousand francs; there are five of them, which makes seven hundred and fifty thousand francs. You see what is to come to me. . . ."

The religious question, which was another difficulty, was settled by Miss Birch, who seems to have spontaneously offered Lamartine to turn Catholic. "I read," he writes to her on the 6th of December, 1819, "to my mother the little item in your letter on the point of religion; she was very much moved by it." In the same letter he avows having incurred some debts in his youth which were paid by his family. He confesses to have been one of "those inconsiderate and prodigal characters of whom you speak; I have indeed expiated it." Lamartine remained all his life one "of those inconsiderate and prodigal characters." He lived always too much in the world of dreams. Immediately after a long account of his money affairs, he sends to Miss Birch the last "Méditation" which he had composed—"La Prière," beginning with

"Le roi brillant du jour se couchant dans sa gloire."

"I am sorry," he says, "to have covered a page and a half with these verses, but if they please you a moment, I pardon myself." They did please Miss Birch, and we cannot wonder at it. She loved the poet, and would have none of the questions which occupied the two families of Lamartine and Birch come between them. What she was as a girl, she remained as a woman; Lamartine was really her god.

Lamartine's reputation as a poet was rapidly extending. We have all the letters which he wrote to Miss Birch from Paris; he was named *attaché d'ambassade*, and Mrs. Birch's opposition to the marriage ended at last. The 'Méditations' appeared on the 13th of March, 1820. They formed a volume of 116 pages, containing twenty-four poems, without any author's name. Lamartine wrote to Miss Birch: "I have just published a small volume which has a success here that astonishes me, especially in this anti-poetical time. I have kept the first copy for you. The beginning and the end of all my actions belongs now to you." He was thinking of her when he wrote these verses:

"Au fond de cette coupe où je buvais la vie
Peut-être restait-il une goutte de miel.
Peut-être l'avenir me gardait-il encore
Un retour de bonheur. . . ."

—an allusion to the past which Miss Birch well understood. The marriage contract was signed in May. Mrs. Birch gave her daughter 10,000 pounds sterling, keeping for herself the income, a part of which only (6,000 francs) went to Lamartine and his wife. The marriage ceremony took place at Pugny, near Chambéry; the father of Lamartine was represented by Count Joseph de Maistre. Thereupon Lamartine and his wife left for Italy, with Mrs. Birch. Madame de Lamartine remained always what we have seen her at first; she was entirely and absolutely devoted to her husband and to his glory.

Correspondence.

FOOTBALL REFORM.

To the Editor of The Nation:

Sir: Most of the suggestions that have been made public concerning the reform of college football, seem to go wide of the mark, because they are not aimed at the real evil. The maiming, or even the killing, of a boy now and then during a game is not of great consequence except to the boy himself, and to his family and friends. The real evil of the game, under present conditions, is the debasing of the ideals, not of college boys alone, but of all the boys in the country that are large enough to wear trousers. The most captivating honors in school are now to be won, not in the classroom, but on the athletic field. It is the monstrous disproportion between work and play in school life that needs reforming, not the rules of the game.

So long as a dozen youngsters are permitted to go out and earn $50,000 in a day, playing football, and, worse yet, are permitted to spend it all for sport in a single season, it matters not what the rules of the game are. A pillow-fight for such stakes would be as mischievous.

What could be more grotesque than the make-believe efforts of college faculties to keep college sports on an amateur basis, by prohibiting the earning during vacation of a few dollars in playing the game by the members of a team, and permitting them to make it their main business, in term-time, to train, get into condition, and earn thousands of dollars by the same means?

The point of view of the candidates of the teams is that of the professional; the training for the games is that of the professional; and the spirit in which the games are played is worse than that of the professional, who allows no unfair slugging, even in prize-fights. The American college undergraduate is fast losing all conception of any difference between amateur sport and professional gaming.

If the playing of college games for money were prohibited, and the sports otherwise were put on a purely amateur basis, with some moderate restrictions as to the amount of time that may be devoted to sport in term-time, the matter of the rules of the game might safely be left with the boys, where it belongs; and it seems likely that, after a little while, work and play in school would resume their proper perspective.

Fairhaven, Mass., December 29, 1905.

WHAT THE NAVY NEEDS.

To the Editor of The Nation:

Sir: I have a briefer answer than yours to the question What the Navy Needs. It needs destruction. There are reasons for believing that the time has come when the Christian nations must face the question of disarmament. The rampant militarism bred by war and breeding war in its turn is not only a gigantic crime: it goes to the limit of senselessness and absurdity, and excites the disgust of all right-minded men. This implies, of course, that the President is not a right-minded man. I have read carefully what he says in his recent message about "demagogues of peace" and disarmament, and I seem to be the only man in the country that has done so. That such argument should be accepted without comment is sufficient proof of the intellectual and moral confusion of the times.

Roosevelt to the contrary notwithstanding, I here affirm that there are no "demagogues of peace," and cannot be in the present condition of human opinion; and that the Rooseveltian proposition that "disarmament can never be of prime importance" is the contrary of the truth It would be nearer the truth to say that it alone is of prime importance. But here a misapprehension must be corrected. It is not, as the President assumes, "the free peoples, the enlightened, independent, and peace-loving peoples, who, on the whole, stand for justice," that are invited to disarm; there are no such peoples on the globe. The armies and navies that menace the peace of the world and impose upon us an intolerable burden of taxation, are now maintained by the "barbarisms" and "despotisms" that call themselves "Christian"; and it is this stupendous mockery and hypocrisy that the handful of men whom the President stigmatizes as "demagogues of peace" would abolish.

"There is more need to get rid of the causes of war than of the implements of war," says the President. But what if among the causes of war the implements of war hold a conspicuous place? What if a navy is a challenge to combat rather than a guaranty of peace? What if the Rooseveltian doctrine of the navy as a guaranty of peace is contradicted by universal experience and discredited by enlightened reason?

Alvah F. Hamilton.

Granville, O., January 1, 1906.

THE ARRANGEMENT OF MUSEUMS.

To the Editor of The Nation:

Sir: In your last issue, Professor Moore finds danger in a policy of choice in museum collections between objects of artistic interest for public exhibition and objects of scientific interest for private study. Nevertheless, that such a policy has the sympathy of the instructed public, is indicated by a quotation from the last number of *Le Musée*, which has come to hand as I write:

"The public is accustomed to consider the Louvre as a museum of art, and it does not look favorably upon the choice of works which have merely the interest of curiosity. We have secondary museums where the learned can accumulate to their hearts' content the paintings and sculpture of minor artists, noteworthy mainly for their rarity. Here belong also collections of archæological fragments which, however they may aid us in following the artistic or political developments of nations, are nevertheless incapable of giving either a vision of art or a vital lesson, and have significance only under the glass of the expert."

(*Le Musée*, Revue d'Art Antique, Paris, Nov.-Dec., 1905, II. 6. 'Le Carnet de l'Amateur.' p. 2.)

Very truly yours, I. L. M.

January 5, 1906.

Notes.

Houghton, Mifflin & Co. have in preparation a so-called "manuscript edition" of Thoreau's complete writings, limited to 600 sets, "each containing a page of Thoreau's autograph manuscript." The illustrations will be from photographs. The last fourteen of the twenty volumes will contain the Journal, edited by Bradford Torrey.

J. B. Lippincott Co., Philadelphia, have in preparation for the spring 'The Fall of Tsardom,' by Carl Jouhert; 'Consumption: Its Relation to Man and Civilization,' by John Bessner Huber, M.D.; and 'Heroes of Discovery in America,' by Charles Morris.

A new, extensively revised edition of Champlin's 'Young Folks' Cyclopædia of Common Things' will be issued directly by Henry Holt & Co.

The *Vossische Zeitung* of Berlin reports the details of a contemplated chronological edition of Goethe's poems under the auspices of the Berlin Gesellschaft für Deutsche Literatur. In the address of the chairman, Prof. Erich Schmidt, in which the work was outlined, attention was drawn to the fact that Goethe had himself emphatically refused to publish his works in chronological order, and that Heine and Scherer regarded the æsthetic arrangement adopted by the great poet as indispensable for the proper appreciation of their beauties. But Schmidt considers a chronological edition demanded for scientific and literary reasons, and proposes to arrange the poems under the following heads: (1) The poems down to the Strassburg period, 1770; (2) to the autumn of 1771; (3) to November, 1775; (4) to the Italian journey; (5) all others according to Goethe's own arrangement.

Mr. Justin McCarthy's 'History of Our Own Times' (Harpers) is brought to a close by the recent publication of the fourth and fifth volumes. These carry the story from Queen Victoria's Jubilee in 1897 to her death in 1901. Mr. McCarthy's method, style and point of view are too widely known to require comment; it will suffice to say that the level of previous volumes is maintained. A considerable space is devoted to a retrospect of the social, literary, and artistic aspects of Victoria's reign.

A very interesting personage is the subject of a thesis by Mr. A. E. Shaw entitled 'Michel de l'Hospital and his Policy' (Henry Frowde). L'Hospital stands out among his contemporaries in France nearly as strongly as More does in England; and although Mr. Shaw does not venture on the broad field of historical parallels, yet he does useful work by his painstaking summary of the subject.

In his 'Monopolies, Trusts, and Kartells' (London: Methuen), Mr. F. W. Hirst contends that competition is still the life of trade. Even as to railways, he holds that the case for great combinations has not been made out. Experience, he thinks, is against the assumption that competing roads will come to an agreement as to traffic for which they are rivals. Admitting that competition cannot entirely solve the transportation problem, the author favors, not nationalization, but control which will fix rates, encourage competition, discourage amalgamation, and prevent personal discrimination. Railway monopoly, at most, merely means a margin of superiority over waterways, trams, busses, and human legs! As weapons of defence, public authorities may employ alternative means of transport, especially canals, and potential rail routes, as well as taxation, in dealing with roads charging high rates or "unrighteously struggling after monopoly." Mr. Hirst charges protective tariffs with the entire responsibility for Trusts. The balance of economies of large organizations has not increased in the last fifty years; and Trusts, he thinks, have betrayed in times of emergency the same signs of weakness as competitive industries. The real purpose of Trusts is to raise prices; and in free-trade countries no Trust can raise prices above the natural or international level. He says, in fact: "Most if not all the English Trusts are merely large, well-organized business concerns which are so cleverly managed that they earn for a time enormous business profits, and perhaps undersell and ruin most of their competitors, so as to establish temporarily a quasi-monopoly. In course of time, however, they decline and fall before new and more energetic competitors."

In our recent remarks on "Yale Studies in English," no reference was made to the latest member of the series, No. XXIX. (already published then, but not at hand), a voluminous edition of Ben Jonson's "The Devil is an Ass." The editing, by Dr. W. S. Johnson, if not inspired, is on the face of it an honest attempt at scholarly thoroughness. As against 122 pages of Jonson's text, there are 200 pages of introduction, notes, etc. This material a more experienced and self-denying editor, for example Professor Dowden, would undoubtedly have managed to condense, omitting many of the notes. It is questionable whether "the present editor" has denied us any of the "results" of his "study." In fact, like several other members of the series, this seems to suffer from what may be called a lack of artistic restraint in annotation. Shunning difficulties by silence is more common.

A new revision of the Schlegel-Tieck German translation of Shakspere, by Professor Conrad, has just made its appearance in five elegant volumes issued by the Deutsche Verlagsanstalt of Stuttgart. That a revision of this standard text was necessary had been recognized on all hands, and efforts in this direction had been repeatedly made. Conrad's labor has been expended largely on the metre, the exact reproduction of the thought, and the correction of blunders on the part of earlier translators.

Ferdinand von Richthofen's last work, an incomplete report of the 'Ergebnisse und Ziele der Südpolerforschung,' which he had begun to prepare by direction of the Kaiser, has been printed at the special request of the latter, and published by the house of Dietrich Reimer, Berlin. The famous geographer gives a thorough survey of the problems to be solved by the south-polar expeditions, and describes particularly the services of the German expedition under Von Drygalski, a pupil of Von Richthofen, in this direction, above all in the investigation of the fauna and flora of the regions explored. This is the extent to which Von Richthofen had completed his work, but no materials have been found to indicate how he intended to continue it, beyond a discussion of such problems as the meteorology and kindred subjects of the polar world.

The *Deutsche Medizinische Wochenschrift* reports that the fears entertained some years ago, when women were admitted to the study of medicine at the German universities, that they would in the course of time prove serious rivals to male practitioners, have been proved unfounded. Official statistics, as well as the special investigations of Dr. Johanna Maass, have shown that, since the year 1900, only forty-six women have been admitted to practice in Germany, and only six have become dentists. Only thirty-one women physicians could still be traced, and, of these, nine are found in Berlin; of the six women dentists only one is in the capital city. Of the thirty-one reporting, twenty-four confine their practice to women and children, four are specialists, and three are assistants at medical institutes. State examinations were taken by these women in eleven university towns, and thirty took academic degrees. Four are married.

The Cultus Ministerium of Rumania has arranged with the German Government to establish a Philological Seminary for the Rumanian language in connection with the University of Berlin. The new arrangement is to go into operation during the present winter semester, and the work is to be in charge of Dr. Heinrich Tiktin, who will bear the title of ordinary professor in the University. The Rumanian Government devotes 20,000 francs per year to this new departure.

The Japan Year-Book Office in Tokio issues for one dollar, gold, a 'Japan Year-Book' of 400 indexed pages in 29 chapters, with appendix, giving the usual facts, figures, and descriptions appropriate to such a publication, including a sketch of the late war, diplomacy, finance, texts of the Anglo-Japanese alliance and the Korean treaty, and (what will interest foreign readers more than anything else) 60 pages of biographical data concerning "contemporary worthies," forming a pretty fair beginning for a Japanese 'Who's Who.' Though written by Japanese, the English is very good, and next year's edition is promised for May.

While Japan affects the benevolent assimilation of Korea's foreign policy and professes virtuous abstinence from interference in her domestic concerns, it is good to have an independent critic, with at least respectable powers of observation and judgment, who is bold enough to speak the truth as he sees it. The delayed October number of the *Korea Review* contains a powerfully written arraignment of "Japan as a Colonizer," showing the abominable customs of the low-class subjects of the Mikado. From them, and not from the polished gentry, comes the typical man now domineering this Oriental Finland. They "do not hesitate to kick and beat and rob Koreans right and left"; they "build in Seul on a prominent site a huge brothel, housing hundreds of the votaries of vice, and flaunt it in the face of Koreans"; they have "not

one word of genuine sympathy nor a hint as to real helpfulness," nor have the official class of Japanese "the primary and fundamental qualifications for successful handling of the Korean people." The article on "The Korean Customs Service" is a valuable historical review of what is righteous and what is rotten in the finances of the now prostrate empire virtually absorbed by Japan. In the news calendar we read that "experiments with American cotton seed in Korea having proved successful beyond expectation, the Cotton Association has arranged to establish thirty seed-cotton farms in various sections of Korea."

The trade of the United States with the principal countries of the world will be the subject of a series of articles to be published weekly during the coming year by the Department of Commerce. It began on January 1 with the United Kingdom, showing what our trade with that country was in 1905, and the principal articles which formed the exports and imports, and comparing present conditions with those of earlier years. The design of the series is to stimulate the public interest in this study of our foreign commerce.

The October number of the *Pennsylvania Magazine of History and Biography* began publication of Washington's Household Account-book, 1793-97, in the Society's possession. The first eighth is in the handwriting of Tobias Lear, the rest in that of Bartholomew Dandridge. Of more curious interest is a translation of parts of a one-act drama, with analysis of the whole, by "Polonius" Kotzebue, called "The Quaker," in which the principal actors are Lord Howe and his son and Warner ("Walter") Mifflin and his. The verisimilitude on the Quaker side is noticeable, and the interview seized upon is historic. The translation is by Amelia M. Gummere.

A correspondent writes: "In last week's *Nation* (December 28) there is, under Notes, a brief notice of the latest issue ('Lear') of the pocket edition of the First Folio, 'so scrupulously edited by Misses Porter and Clarke.' I have just read 'Hamlet' in this edition, and surely every teacher and student of Shakspere must feel under obligation to both editors and publishers. The least excellent part of the editorial work is to be found, under 'Literary Illustrations,' in the interpretation of difficult passages, where the light of the New English Dictionary seems to have been shut out, and old guesses are repeated."

—Against the proposed rate legislation the charge of impracticability is brought with great force, in the January *Century*, by President Samuel Spencer, of the Southern Railway. The burden of his argument is that no such commission as is proposed could deal effectively and satisfactorily with the innumerable intricate questions which arise, and many of which must receive almost instantaneous adjustment unless serious injury is to be done to important business interests, often involving extensive sections of the country. The railroads themselves, we are told, find it necessary to employ about eight hundred traffic experts, in addition to something like three thousand soliciting and travelling freight agents, whose duty it is to study the peculiar and constantly changing conditions of their various sections. Can this intricate mechanism be subjected to the positive rate-making power of an outside commission, necessarily composed of comparatively inexperienced men, without serious danger of throwing vast business interests into disastrous confusion? President Spencer thinks not. Congressmen who are proposing to pass beyond the punishment and restraint of actual abuses and take up the positive direction of the traffic business, would do well to ponder the reasons for his opinion. For the Franklin anniversary, the *Century* has had the good fortune to secure a paper by the late Secretary Hay, on Franklin in France, prepared for delivery in Chicago some years ago, but never used because of Mr. Hay's ill-health at the time. Mr. Hay humorously calls attention to the fact that our first foreign minister was a defeated candidate for Congress, Silas Deane, who was sent to France some months in advance of Franklin and Arthur Lee. "A quiet legation is the stuffed mattress which the political acrobat wants always to see ready under him in case of a slip."

—The selections from Bancroft's letters and diaries, which have been a marked feature of *Scribner's* for some months past, come to an end in the January issue with the close of his diplomatic service at Berlin. The extracts are largely of a personal nature, and bring the reader into contact with many eminent characters, including Lepsius, Bekker, Ranke, Trendelenburg, Hofmann, and Curtius, together with various men of high political rank. In one letter we have an account of the escape of the Empress from Paris, in 1870, the details of which Mr. Bancroft had from Dr. Evans himself, shortly after the event. One of the most pleasant incidents of his service was the formal renewal, by the University at Göttingen, of the doctor's degree which he had received just fifty years before. Thomas F. Millard, writing of the settlement between Japan and Russia, shows an emphatic unwillingness to believe that any lasting equilibrium has been established. Korea is simply held under Japanese tutelage by force, with no hope for a restoration of freedom, and there is no promise of any genuine reversion to Chinese administration in Mantchuria. On the basis of personal observation during repeated sojourns in Mantchuria, he expresses the conviction that Japan, during her short occupation of southern Mantchuria, has done far more to destroy Chinese autonomy than Russia had ever done. Of course, there is the inevitable corollary, from the whole situation, that the United States should largely increase its naval strength in the Pacific. If the germs of that conclusion do not exist in any premises whatever, it will at once appear by spontaneous generation.

—Judge Francis C. Lowell opens the *Atlantic* with a plea against the adoption by this country of a strictly professional diplomatic service. We could ill afford, he thinks, to adopt a method which would in the past have excluded from our foreign service such men as Motley, Bayard Taylor, Choate, Lowell, and Andrew D. White, ministers whose general culture and ability have proved of far more value to us than any amount of mere professional training. Our ministers to Great Britain during the past half-century are compared with the lists of British ministers to this country and to France, to the decided advantage of the American list. The European method, he thinks, sacrifices initiative to routine, and so fails in great emergencies. Incidentally he touches upon one serious result of the fact that small salaries have led gradually to the almost exclusive selection of our leading ministers from the wealthy classes. Forced to use of their own funds, they expend altogether too lavishly, and so establish a precedent very burdensome to any successor of less, or possibly even of similar, wealth. To establish conditions under which no one but a multi-millionaire would consent to hold an ambassadorship, would evidently be a great misfortune. The growing evil should be controlled, he suggests, by setting the salary at a reasonable figure, and giving strong intimation to the incumbent that expenditure beyond this sum would be looked upon with serious disfavor. Samuel P. Orth writes of special legislation in our State Legislatures, with reference to the possibility of some substitute. Many requests for such legislation are inherently equitable, but the whole field of private bills belongs rather to the realm of adjudication than that of legislation, and the Legislature should be relieved by the creation of some properly constituted body to deal with business of this nature. Great advantage would be gained, he thinks, by a return to the old New England idea of local self-government. In the absence of some effective method of dealing with merely local and private matters, constitutional prohibitions are and must ever be ineffective to prevent special legislation.

—Among the innumerable exceptions to Dr. Osler's famous dictum we beg leave to catalogue one Dr. Lavendar, of Old Chester, Pennsylvania, who, at an age of presumable incapacity, again steps forward, in the pages of *Harper's*, as leading character in a new novel. Is it not about time for the establishment of a Carnegie fund to lighten the labors of aged characters in the field of fiction? Mr. Nevinson's slave-trade investigation continues in the same depressing strain. He believes, though admittedly without conclusive evidence, that efforts were made to poison him by parties interested in suppressing his revelation of present conditions. A forecast of his closing paper, to appear in February, indicates a severe arraignment of England for her neglect of alleged responsibility in the matter, and an urgent call to our own Government to enter vigorous protest against the continuance of the evil. Less harrowing to the nerves are a number of articles of more remote ethnological interest, including a description of recent mound explorations in the Black Warrior River region of Alabama, by H. Newell Wardle of the Philadelphia Academy of Natural Sciences, a collection of legends of the City of Mexico, by Thomas A. Janvier, and a paper on the Indian music of South America, by Charles Johnson Post. The Easy Chair is moved by the Conway autobiography to moralize entertainingly on the old problem whether there was really any possibility that the evils of the past should have been by choice avoided, while Dr. Alden, in the Study, still continues to find grounds for an optimistic view of present-day literature.

—The quarterly periodical by way of eminency, the Oxford English Dictionary (H. Frowde), continues in its January issue the

letter R (Reign-Reserve) under the direction of Mr. W. A. Craigie. The prefix re- of course plays an extensive part in this section—Reign to Reserve—and it would puzzle not only a foreigner but a native to distinguish it in every case, and to pronounce rapidly the words here found in juxtaposition. Reigning, Reignite, Reillume, Reim, Reimage, are examples found on the first page. We have marked for notice some proofs of the birthright fluidity and redundancy of our speech. Relation (kinsman) is recorded for 1502; Relative, at a decent interval, for 1657. From 1485 Repository was spelt with penultimate *o*; in 1862, Dean Goulburn (or shall we rather say his printer?) preferred *a*, and now one may take his choice. In 1832 Harriet Martineau used the form Reproduceable; in 1834, Reproducible, the handier of the two. Repertory, in the sense of 'index, list,' goes back to 1552, and first in 1845 annexes the meaning of dramatic stock; from 1847 to 1885 the French *répertoire* was adopted as French; in 1897 one no longer feels called upon to italicize the word, whose naturalization is assured by dropping the accent of the first *e*. We have now, consequently, two English equivalents. Similarly, in 1451, Replevy was English for the writ, side by side with the Anglo-French Replevin. Renown (by way of Anglo-French) was well established in the fourteenth century, but Chaucer took over Renomee' from Old French, while Lord Berners, translating Froissart in 1523, adventured Reno'me, which it would have been handy to keep for poetic resource (as would Remenant for Remnant). Finally, the spellings Repellant and Repellent have an equal age and authority.

—There are plenty of people who still need to be told that Reliable is a grand old English word (1569), even if it came into familiar use only some three centuries later, Coleridge meantime (1816) building Reliability upon it; Mr. Craigie briefly sets this forth, with a mention of analogies and a proper reference to the late Fitzedward Hall's standard work on adjectives in -able, -ible. Under Religion is noted Cicero's derivation (*relegere*, 'to read over again'), along with our modern preference for *religare*, 'to bind,' in the effort to find a definition and a sanction. Under Reins is a curious quotation from Wyclif's version of Ezekiel ix. 2: "O man . . . clothid with lynnen, and an ynkhorn of a wryter in his reynes," where the King James version reads: "And one man among them was clothed with linen, with a writer's inkhorn by his side." Reporter (for the press) turns up in 1815, but the verb to Report only about 1850—Reportorial, which seems not to have been laughed down as irregular, in 1860. Reminisce, which suggests journalistic coinage, began as transitive verb in 1829, and was in intransitive employ in 1882. Addison (1702) is cited for Republic of Letters, showing one phase of the Oxford Dictionary as a book of familiar quotations. The older parties grow, the more difficult it is to formulate their principles, so we will conclude with Mr. Craigie's account of what constitutes Republicanism in the United States: "A party . . . which favors liberal interpretation of the Constitution, extension of the central power, and a protective tariff."

—The eleventh annual meeting of the Central Division of the Modern Language Association of America occurred at Madison, Wis., December 27-29. "The attendance," writes a correspondent, "was somewhat smaller than on former occasions, yet about one hundred were present at the opening session. As hosts, the faculty of the University of Wisconsin were ideal. Their hospitality was Western in its cordiality, Southern in its graciousness. To receptions, luncheons, and smokers the members of the Association have been accustomed; but to a hospitality that included the entertainment of the visitors during the entire meeting at the homes of the members of the general faculty of the University, they have hitherto been strangers. Of the papers presented at the meeting it is impossible to speak in detail. The chairman's address does, however, demand special mention. Professor Blackburn chose as his theme 'A Neglected Branch of the Teaching of English.' This neglect he defined as 'training in talking, in the oral use of the mother tongue—not oratory, lectures, etc., but the use of speech in the ordinary events of life.' Professor Blackburn pointed out the fundamental distinction between learning to speak a language and learning to read and write it. The one depends upon the memorizing of facts, the other upon the gaining of skill through practice. They are, therefore, two distinct branches. But modern social life, while rendering both indispensable, has provided very inadequately for the former. The child acquires such knowledge of the mother tongue as he may through the associations of home, playground, and the street; a large part of the instruction thus given being ill fitted to develop correct habits of speech. In the secondary school the conditions are scarcely more favorable. Here the training in oral speech is confined mostly to the correction of bad habits of speaking, and does not tend toward the development of either fluency or correctness. In the college, conditions are, if possible, still more unfavorable. Here special attention is given to practice in writing, while practice in speaking is almost wholly neglected. The result of all this neglect of systematic training in the use of the spoken word is a lamentable inability on the part of most of us to express our meaning clearly and forcibly when occasion calls for it. The causes of this inability are many. One of the commonest is a lack of a stock of words thoroughly at command. Another cause is inexactness in the use of words, due to ignorance of their meaning and connotation. Mispronunciations, grammatical faults, slovenly utterance, and similar defects make up the sum total of the deplorable lack of skill in the use of speech so apparent among us. The remedy is to be found in more practice. Professor Blackburn suggested the use of oral themes as a part of the rhetorical training in school and college classes. He urged also that all recitations in any subject be treated as exercises in the development of correct habits of speech. In the study of foreign languages, ancient and modern, is afforded the best possible training in oral speech, since translation is a kind of oral composition. By such means, without burdening the overcrowded curriculum of the schools with new subjects, may teachers do much to supply the defects of early training in the use of the mother tongue. At the business meeting which concluded the sessions, officers for the ensuing year were chosen as follows: For chairman, Prof. E. P. Baillot of Northwestern University; for secretary, Prof. C. B. Wilson of the State University of Iowa, to succeed Prof. Raymond Weeks, whose resignation was accepted with regret. The executive committee will consist of Profs. T. A. Jenkins of the University of Chicago, H. M. Belden of the University of Missouri, and M. F. Liberma of the University of Cincinnati. The next meeting will be held at Chicago. The increase in membership of the Association during the past year has come largely from the Middle West. The total active membership is now 708."

SEA POWER IN 1812.

Sea Power in its Relations to the War of 1812. By Capt. A. F. Mahan, D.C.L., LL.D., U. S. N. 2 vols. Boston: Little, Brown & Co. 1905.

In these handsome volumes, uniform with his other works on Sea Power, Captain Mahan is at his best. He has descended from the clouds of prophecy and speculation to walk with firm tread upon ground which he has made peculiarly his own. The involved and obscure style, so appropriate to the utterances of the seer, has disappeared, remaining, if at all, only as an occasional echo from the past, while the vigor of his sentences reflects the confident holding of opinions wherein lurks no shadow of doubt. Combined with these beliefs is a fine sense of responsibility to make others share them, and to present the course of the events which led to the War of 1812 as the inevitable result of certain economic and maritime doctrines carried to their logical extreme by one nation, which possessed an abundance of sea power, against a second, comparatively destitute both of the means and the will to resist. Others have recited the chronicles of the War of 1812, but it was reserved to Capt. Mahan to write its history. As an analyst, he traces the vexations and irritations precedent to hostilities back to their ultimate source; as a strategist, he describes the several campaigns and their incidents, both naval and military; and, as a naval officer, he perceives and preaches the inconceivable folly of not providing, in time, some respectable measure of defence.

The high plane from which he views this period can be best illustrated by suggesting that he appears to consider military and naval events, interesting and memorable as they are, as of no greater importance than the occurrences which brought them about. A few fights on land and sea are to him of less moment than the mighty flow of a country's development. A political principle, whether right or wrong, adopted by a sturdy people, maintained with inflexible resolution for nearly two centuries, accepted as the only possible means of self-preservation, regarded as the fountain of national prosperity, and never formally abandoned, is a large enough factor in the world's affairs to challenge the respect of the author, and to warrant his devoting to its unfolding over one-third of his eight hundred and thirty-odd pages. No better index of the general scope of this

work is needed than the large proportion it gives to antecedent and determining causes, a subject which Mr. Roosevelt, for example, in his 'Naval War of 1812,' very properly dismisses in half a dozen pages, as being aside from his purpose.

Capt. Mahan is quite right in saying that "it may seem at first far-fetched to go back to 1651 for the origins of the War of 1812; but without such preliminary consideration it is impossible to understand, or to make due allowance for, the course of Great Britain." The Navigation Act of that year, framed with the intent of forcing commerce into English bottoms as an indispensable agency for reaching British consumers, directed that "no merchandise from Asia, Africa, or America, including the colonies, should be imported into England in other than English-built ships, belonging to English subjects, and of which the master and mariners are also, for the most part of them, of the people of this commonwealth." "Foreign merchantmen," so Capt. Mahan points out, "might import into England the products of their own country; but both they and English vessels must ship such cargoes in the country of origin, not at any intermediate port." Later, a concession to foreign vessels was

> "further qualified by heavier duties, called aliens' duties, upon their cargoes; and by the requirement that three-fourths of their crew entering English ports should be of the same nationality as the ship. The object of this regulation was to prevent the foreign state from increasing its tonnage by employing seamen other than its own. This went beyond mere protection of English vessels, and was a direct attack, though by municipal law, upon the growth of foreign shipping."

Having stated the aim of this and subsequent legislation by Parliament, the building up of British commerce, and the increasing of the number of English seamen available for employment in time of war, the author proceeds steadily and surely, by a chain of exceptional occurrences and through the devious paths of diplomacy and negotiation, to the day of our rupture with Great Britain, fortifying his conclusions at every step by reference to original documents or other acknowledged authority. England's attitude on the ocean towards foreign vessels was a natural corollary to the position she had assumed in her great Navigation Act. It was that of the strong man who deliberately ignores the rights of the weak. Adopted at first for selfish reasons, its maintenance in the gigantic struggle with Napoleon was held to be essential to England's very existence. No British writer could more luminously or powerfully write the brief for his own country's policy than has Capt. Mahan, in his desire to do strict justice to both parties to a quarrel wherein no adjustment was possible without sacrifice of principles conceived to be vital. Even the impressing of British seamen on board American ships, on the ground that allegiance was inalienable and that the King was entitled to the services of his subjects wherever found, which is commonly supposed to have been the chief ground for hostilities, had a certain show of reason at a time when, without sailors to man her ships, Great Britain would have fallen under the French sway. The practice was not at all universally reprobated by leading Americans at the very time. Galling beyond description were the restrictions put upon our shipping.

"The American found exerted over his national commerce a control indistinguishable in practice from that of colonial days. From what ports his ships should sail, whither they might go, what cargoes they might carry, under what rules he governed in their own ports, were dictated to him as absolutely, if not in as extensive detail, as before the War of Independence."

Under such conditions as these, the only wonder is that the break was so long deferred.

These opening chapters could not be shortened without injury. They are of absorbing interest, dealing with happenings often of a thrilling nature, and with a vivid play of human passions and prejudices on the largest scale. Their reading must, not infrequently, be exceedingly painful to us Americans, even if we do not all share Capt. Mahan's contempt for Jefferson, whose preference for gunboats, non-intercourse acts, and embargoes distinctly invited the indignities and insults to which the flag was subjected. The latter was not respected even when hoisted on board a national vessel. We can see how a little firmness and preparation, in season, would have spared us much humiliation, probably war itself. We must grieve over the position of the United States, whose commerce seemed likely to be crushed out of existence between the upper millstone of the Berlin Decrees and the nether millstone of the Orders in Council, and we blush for our duplicity in contending with France that the Emperor had not rescinded the Berlin Decrees, and, at the same instant, with Great Britain that we had. We shall never be great as a people until we cease being "smart."

In his preliminary discussion of the theatre of war and the strategy dictated by geographical conditions and by our own paucity of naval force, Capt. Mahan points out that the United States on the land could move offensively only on the Northern frontier, where reasons of both political and military expediency combined to impose prompt action. On the sea, she might harrass British commerce to some extent, but she could deliver no really effective blow against Britain's overwhelming fleet. Upon these two considerations might have been based a correct plan of campaign, involving a skilful disposition of our few ships, on the one hand, and a vigorous use of our army, on the other. It is interesting to note that, of the three officers whose opinions were asked by the Navy Department, to Commodore John Rodgers, who alone held broad and sound views as to the employment of our scanty marine, fate denied the opportunity of personal distinction which fell to the lot of his colleagues, Decatur and Bainbridge. He advised combined action and the moving in squadrons, while they favored dispersion of the ships and "relying upon the enterprise of their officers." The Department endeavored to adopt both suggestions, with the natural consequence of failure to secure the benefits of either. It is observable that Capt. Mahan apparently sees no valid ground in the events of this war for changing his often-expressed opinion as to the inconclusive nature of privateering, a subject which he deals with fully and sympathetically in his Chapter XIV.: "The achievement of the naval vessels was to that of the private armed nearly as three to two. These results may be accepted as disposing entirely of the extravagant claims made for privateering as a system, when compared with a regular naval service." His Chapter V. is worth reading for its careful exposition of conditions at the moment hostilities began, both as to men and means, and especially for its definition of the author's point of view.

The touchstone of Sea Power is applied even to the operations on our Northern frontier during the entire war, which, despite their seeming confusion, are now shown by this form of analysis to have been consistent and coherent. We were oblivious, as Brock was alive, to its potency; hence his successes at Detroit and elsewhere, and our own failures until Perry's victory on Lake Erie, after which the Northwest returned to the American fold. While using this principle as a guide through the tangle of events, it must not be supposed that the author has written a thesis in its defence; yet its truth, assumed from the outset, is tested at every point.

With the varying phases and incidents of this war, we are all so familiar that a new writer can hope only to elucidate some rather obscure point, such as Elliott's conduct at the battle of Lake Erie, Lawrence's mental attitude when he engaged the *Shannon*, and the tactics of certain encounters on sea and land, unless, as is the case with Captain Mahan, he brings to bear some fresh method of analysis to stimulate on the part of the reader an interest which monotony of previous narration had somewhat dulled. In considering both sides of the struggle, Captain Mahan is impelled to remark that "it is in such study of reciprocal action between enemies that the lessons of war are learned and its principles established, in a manner to which the study of combats between single ships, however brilliant, affords no equivalent," unconsciously emphasizing the difference between himself and his predecessors. At the same time he goes minutely into the operations of the various campaigns, so that any one who cares may learn all the tactical incidents of each action.

He finds that the harrying of our coast towns and even the burning of our national capitol were less influential in producing a willingness on our part to end hostilities than the rigid commercial blockade established and maintained by the British south of Narragansett Bay. American commerce, it appears, dwindled rapidly until, in 1814, it was practically annihilated. A few ships of war, instead of Jefferson's preposterous gunboats, would have repaid their cost a hundredfold. The universal distress created by the close grip on our harbors and estuaries is mentioned by all the historians who write of this period, notably by McMaster and Henry Adams, but its value as a military measure is best exhibited by Captain Mahan. One might almost say that the distinguishing feature of this history of a famous war is the prominence given to the indirect effects of its less striking naval movements.

The final chapter, giving the details of the peace negotiations, is most interesting. Hampered by the arbitrary demands of the British Government, the commis-

sioners were unable to agree even when both countries were heartily tired of war. Happily, at the critical moment, the sensible counsels of the Duke of Wellington turned the scale, and a treaty was signed wherein not a single principle for which we had unsheathed the sword was even mentioned. Wise in its day, and establishing a precedent which might well be followed now, Downing Street insisted on ratification without change or amendment in any particular, thus wantonly depriving our Senate of a rare opportunity to display its ability to undo good work.

There were, throughout the struggle, gallant deeds on sea and shore reflecting credit on Americans and British alike, but the story is, after all, saddening. Like many wars, this was ill-considered and foolish; like most wars, it was entirely avoidable. Of a prudent making ready in advance, as the Japanese have recently done, there is no trace. Our strategy was faulty to the verge of childishness; our military leaders at the outset were superannuated and incompetent; our own people, divided in sentiment, were so keen after gain that they traded with the enemy whenever and however they could. Ruthlessly destroying Newark, Ontario, we provoked the legitimate response of Ross and his invading army in the burning of our national capitol. Having neglected to fill the ranks of our regular army in season, we trusted to a militia that, but too frequently, broke and ran after the first volley.

On the other hand, the impressment of seamen, though never formally abandoned as a right by Great Britain, has not been practised by her since the Treaty of Ghent. So discordant were the various communities in our political body, and so conflicting their interests, that one is tempted to believe, with the historian, that only through the external pressure exerted by a strong and somewhat unscrupulous enemy could they have been welded into a self-contained and interdependent State; the Revolution finding its complement in the War of 1812. The former freed us; the latter made us into a nation. Herein we find such consolation as we may in reading one of the most scholarly and absorbing in the series of recent American histories, and eminently worthy of a place on the library shelf beside the larger works of Henry Adams, McMaster, Rhodes, and Woodrow Wilson.

The Flower Book. By Sir Edward Burne-Jones. London: The Fine Art Society. 1905. 300 copies numbered; no further issue.

It seems impossible that color reproductions of water colors could be carried to greater perfection than in this 'Flower Book' facsimile by the firm of Piazza & Co., Paris. At the Society's rooms in Bond Street opportunity has been given to compare the reproductions with the original designs in the book itself. The lack of imaginative art at the present moment, when technique alone and truth to nature are aims held in view by most artists, to the exclusion of beauty, has been much commented on and deplored; it is therefore of immense benefit that this work, containing all the best qualities of imaginative design, should now be within reach of so many more people than before, and should stimulate individual effort in seekers after the ideal. To the unremitting two years' labor of Signor Piazza and the immense strides in the process of reproduction this good work is due.

'The Flower Book' was the pastime of Burne-Jones's holidays, in his home at Rottingdean-by-the-Sea. He delighted in collecting beautiful names of flowers, of which in many cases the meanings had been forgotten, and for which he found his own interpretation—for no flower appears in any of the pictures; they represent the subjects the names suggested. The designs are circular, six inches in diameter, painted in gouache (water color mixed with body color and gold) on Michallet rough paper. They were begun in 1882, and during sixteen years thirty-eight designs were completed. Many were left slightly sketched in pencil, but these are not reproduced. To quote from Lady Burne-Jones's introductory note:

"He began the series, keeping by him a list of beautiful names that he had met with, choosing subjects from among them from time to time. . . . And first he thought any lovely or romantic name would lend itself to his purpose, but soon found that it was not so, and that comparatively few were of use. Such as had too obvious meaning—as, for instance, Odin's Helen, or Fair Maid of France—he rejected because there was not any reserve of thought in them for imagination to work upon. A picture, he held, should be no faint echo of other men's thoughts, but a voice concurrent or prophetical. It was easy enough, he said, merely to illustrate, but he wanted to add to the meaning of words or to wring their secret from them."

Among these designs are some of Burne-Jones's most beautiful inventions, *e.g.*, 'Golden Gate,'' in which angels are bringing out the sun from the opened gates of heaven to shine on the world; "Morning Glories," in which angels of the Byzantine type, so characteristic of the master, are spreading out clouds at dawn; "Star of Bethlehem," where, in the midst of a rocky landscape, the kings in gorgeous apparel of red and blue and orange are making their way towards the tiny manger in the middle distance, above which shines the star. Splendid in solemnity are "Black Archangel," Satan, sitting enthroned amid flames: "Arbor Tristis," in which the base of the tree of the cross grows up through steps of bare rock against a twilight sky with a window-lighted city below. In some of the subjects we find the themes of Burne-Jones's pictures treated again entirely differently—"Witches Tree," for instance, in which we have Merlin and Nimue; "Golden Cup," representing the Holy Grail; and "Grave of the Sea" with the mermaid and her drowned lover; "Venus's Looking-Glass," in which the moonlight is beautifully rendered, shining into the lake and on the face of Venus. These pictures all have the atmosphere of fairyland; they are like visions of scenes in a crystal ball or magic mirror—creations of fancy full of spontaneity and beauty. They vary much in style, the later ones becoming more Byzantine in character.

The letterpress, consisting of an introduction by Lady Burne-Jones and short explanatory notes to each subject, has been done in script by Mr. Graily Hewitt, this form being considered more suitable to the delicacy of the drawings. The book is bound in dark-green sealskin, or the pictures can be had mounted in sunk mounts separately in a box. Some copies are bound with handtooled decoration designed by Mr. Douglas Cockerell in a more elaborate and costly style.

In the Name of the Bodleian. By Augustine Birrell. Charles Scribner's Sons. 1905.

The president of the Board of Education in the new Liberal Ministry is an expert in the composition of the semi-serious essay. Less frivolous and freakish than Mr. Andrew Lang, but quite as humorous, he writes with a penetrating acumen that has been happily fostered by his legal studies. What mythology and ethnology are to Mr. Lang, the law is to Mr. Birrell, a thing to be taken seriously in the many-colored medley of subjects that must be touched lightly or left alone—Hannah More, for example. At the end of the present volume, named none too attractively from the first of its twenty-seven essays, two have been slipped in that are purely legal—that on "Contempt of Court," and "5 Edward VII., Chapter 12"; the latter, at any rate, is too technical for its company, and had best have ended where it must have begun, in some legal periodical.

With these exceptions, the volume is fully equal in interest to its charming predecessors. It is mainly about books and bookishness, and many of the essays are sublimated book reviews. One of the most charming is "A Connoisseur," a description of the personality of Mr. Birrell's father-in-law, the poet Frederick Locker-Lampson. It is a delicately intimate tribute which will appeal to all readers of 'London Lyrics,' and should increase their number. The late owner of the famous Rowfant Library is best known by these lyrics and by his anthology, 'Lyra Elegantiarum,' a collection of occasional verses which was suppressed by Landor's publishers on a question of copyright. But Locker wrote, or rather compiled, besides these, a 'Patchwork' (the title reminds one of a famous Miscellany of Clement of Alexandria), published in 1879, which had no great circulation, but has proved a boon to many a pressman at a loss for quotations or anecdotes.

Now that Mr. Birrell has taken his place as a Cabinet Minister, adding yet another to England's admirable list of literary statesmen, it is amusing to read an essay written in 1898 and included in this collection, "Our Great Middle Class"—a backward review of Arnold's famous indictment, in 1871, of the English middle class. Mr. Birrell points out that Arnold's message in 'Friendship's Garland' was unheeded by the barbarian aristocrats, and unread (at four-and-sixpence a copy) by the working classes.

. "No; it was the middle class, to whom Mr. Arnold himself belonged, who took him to honest hearts, stuck his photograph upon their writing-tables, and sounded his praises so loudly that his fame even reached the United States of America. . . . They did not mind being insulted; they overlooked exaggeration; they pardoned ignorance. Yet though meek in spirit they have not inherited the earth; indeed, there are those who assert that their chances are gone, their sceptre for ever buried. It is all over with the middle class. . . . The crowds that flocked to hear Cobden and Bright, that abhorred slavery, that cheered Kossuth, that hated the income-tax, are now watered down by a huge population who do not know, and do not want to know, what

the income-tax is, but who do want to know what the Government is going to do for them in the matter of shorter hours, better wages, and constant employment. Will the rabble we wonder, prove as teachable as the middle class? . . . In the meantime it would be a mistake to assume that the middle class counts for nothing, even at an election. . . . As to ideas, have we got any new ones since 1871? . . . Would that we could revive Arminius, to tell us what he thinks of our new Ariel [Mr. Chamberlain] girdling the earth with twenty Prime Ministers, each the choicest product of a self-governing and deeply involved colony. Is it a vital or a vulgar idea?"

These essays are all short, abound in anecdote and gossip about literary men and politicians—there is an excellent one on Disraeli—and it would be a limited taste indeed that could not extract from them several half-hours of entertainment.

Les Troubles de Hollande à la Veille de la Révolution Française. By Henry de Peyster. Paris: Picard.

This is an extraordinarily thorough and minute study of Dutch affairs during the period 1780-1795. Throughout these fifteen years a series of crises, both domestic and international, distracted the Seven Provinces, and left them no alternative but that of settling their disputes by calling in the foreigner. M. de Peyster begins his survey of the situation by sketching the social life of the Dutch at this time, and then proceeds through an account of internal organization to a portraiture of the party leaders. After thus describing the general conditions which marked the domestic situation, he goes on to bring in foreign Powers, such as England. Prussia, and France. In a word, the monograph is a political study, but not in the narrowest sense of the word. The first chapter, for example, with its graphic delineation of Dutch society, might be wrested from the context and published with perfect propriety as an independent essay.

In the political portion of his narrative, M. de Peyster finds space to discuss each of the leading motives at great length: the trouble between the House of Orange and the middle class, the skill of Harris in bringing about the English alliance, the intervention of Prussia, the personal policy of Wilhelmina, and the appeal of the Dutch Democrats to France. As an individual figure, no one stands out so clearly in these pages as Van de Spiegel, Grand Pensionary after the Restoration of 1787. As for the Restoration itself, M. de Peyster calls it the first step on the sad path which eventually led Holland to its salvation. The indolence and apathy of the Dutch on the eve of the Revolution were almost incredible when one considers what the same race had accomplished three generations earlier. At the same time, the country was not without its grandiose aspirations, among which the chief was a project for bringing about a reunion of the seventeen provinces without the use of force or any considerable expenditure. Although the Republic had no real army and was in a bad financial position, it did not realize the extent of its own weakness until it suffered itself to become overshadowed by the influence of England. If Van de Spiegel is the most striking figure of the present piece, the most insignificant is William V. The ancient hold which the House of Orange had possessed upon the affection and allegiance of the masses could not be weakened even by his instability of character, but he managed to lose touch with the middle class altogether, while in his relations with Prussia there is a strong flavor of the burlesque.

In his remarks about the intervention of France, M. de Peyster shows great judgment and fairness of spirit. In 1795 the Dutch fancied that they really wished to secure something like solidarity with France. The exactions of the Directory soon dispelled this dream, and under the Empire the first plots which arose against Napoleon were hatched in Holland. It was then discovered that what was wanted was neither the friendship of England nor of France, but independence. What the Dutch gained from the French Revolution was not so much the birth of new institutions as a fresh stimulus to the democratic spirit, in the recognition of a new ideal to be sought through unity and equality. The régime of Stadtholder and oligarchy disappears before the new conception of a truer citizenship than that of the eighteenth, or even of the seventeenth, century.

This excellent work is solidly based upon a large accumulation of original materials, nor is it less thoughtful than learned.

The Nation.

NEW YORK, THURSDAY, JANUARY 18, 1906.

The Week.

Senator Hale's frank admission in the Senate on Monday that he wished the President had sent no delegates to the Morocco Conference, suggests fresh inquiry what its work is to be. It is to concern itself with the internal reforms needed in that country. It is to discuss, first of all, the organization of the police and the suppression of the contraband trade in arms. Next in order is the reform of the nation's finances, which calls for the establishment of a state bank, improved methods of collecting duties, and the creation of new revenues. Then comes the "outlining of certain principles destined to safeguard the economic liberty of Morocco." In addition, there is on the programme the special question of the policing of the Moroccan and Tunisian boundary and the controlling of the traffic in arms across it, which naturally concerns France and Morocco exclusively. Just which of the nations shall undertake this work of reorganization will, of course, be the knotty point in the discussions. Old residents of Morocco are firmly of the opinion that, however sympathetic the Sultan may be, the Moroccans themselves cannot be depended on to carry out the reforms. What is needed is such an economic upbuilding as that which has gone on in Egypt under Lord Cromer—an administration under which peace and order shall be permanent, and every inhabitant profit to the fullest extent by the national outlay. At the same time, the Sultan's independence is not to be assailed, and the reorganization of the country is to be beyond all else carried on by peaceful methods. The fanaticism of the inhabitants and their intense hatred of foreigners will call for quite as much tact and wisdom in the actual carrying out of the reforms as Lord Cromer has displayed in Egypt.

The mere statement of the problems to be considered must increase the wonder of Senators that the United States should be participating in the Algeciras Conference. If we really have any business in settling the national affairs of Morocco, we must be prepared next to go to work in Crete and Macedonia. and to take part in any future coercion of the Sultan of Turkey. Our trade relations with Morocco are so slight as not to call for a separate item in the monthly and yearly summary of our foreign commerce, being grouped under "All other Africa," which is credited with exports of only $33,813 for the eleven months of 1905 ending with November, and imports of $478,140 during the same period.

It was a Republican Congressman, Mr. McCall of Massachusetts, who on Friday exposed in the House the hollowness of the pretence that the tariff would one day be "revised by its friends." "If the tariff cannot be revised when two-thirds of the membership of both houses is Republican, when," he asked, "is revision to come?" He went on to make the prediction, implied in the letter of Gov. Guild of Massachusetts to President Roosevelt, that if the Republicans prove unequal to the work, the country will put the Democrats in power to do it. But there is one form of tariff revision for which the Republicans are reported ready—revision upwards. They cannot take off 10 per cent. to relieve Americans, but they can clap on 25 per cent. to fight Germans, and make the plight of Americans worse than before. In tariff wars both combatants are certain to lose, yet it is upon a tariff war with Germany that Congress is now preparing lightheartedly to enter. In answer to the protest of our alarmed exporters that our stupid tariff policy endangers their business with Germany, it is proposed to make it more stupid, and, if possible, cut off business with Germany altogether. All this from the party of enlightenment, at the very moment that the policy of tariff retaliation is being trampled under foot in England!

The postmastership of Podunk is, after all, the vital question before Congress to-day. A few private citizens, whose desires are unworthy of consideration, seem to be anxious about the construction of the Panama Canal, about railway rate regulation, the Philippine tariff, revision of the Dingley schedules, and Statehood; but real statesmen know that the progress of the country depends upon the distribution of pap. Thus, Representatives Overstreet of Indiana and Denby of Michigan have —in the expressive language of transcendental politics—"gone up in the air" because they could not "land" their men. Two of the Missouri delegation have openly joined the Republican insurgents against the Statehood bill, and others threaten to follow—not because they care a rap about Statehood one way or the other. The noble principle for which they stand is that the Missouri postmasterships belong to them. For that cause they will pour out their lifeblood and kill every bill that is dear to the President or the Speaker. Representatives are no fools. They see that if they cannot settle questions of patronage, statesmanship is a hollow sham. The only thing left for a Congressman is to frame laws, prepare arguments, and discharge his duties as member of committees. But that is beneath the dignity of the Representative of a great commonwealth—mere work for office-boys and private secretaries. No man of parts will fritter away his talents over legislation when he should devote them to fighting for jobs for his henchmen. The government at Washington must and shall be preserved.

As was expected, the bill for consular reform has been reported by the Senate Committee on Foreign Relations with nearly all the reform knocked out of it. A system of appointment and promotion by merit is too strong meat for the weak Senatorial stomach. What it needs is pap—the pap of patronage. Senators simply loathe the idea that consuls should be originally selected for capacity and promoted for efficiency. The adoption of such a plan would be a terrible blow to party "workers," and would even impair Senatorial grandeur. Consequently, the bill which Secretary Root advocated as a means of taking the consular service out of politics, and making it responsive to the needs and demands of American business men, has been reported in a sadly mangled condition. Consuls are to be named, transferred and promoted "as at present"—that is, by political favor. The Senate is willing, however, that they should be classified and their salaries increased, involving, we suppose, the abolition of the fee system. But the thoroughgoing reform pressed by the State Department the Senate will none of. Here is an excellent opportunity for the President to "do it anyhow." He would be entirely justified in making rules for the first appointment and subsequent promotion of consuls purely in accordance with the merit system. His friends have asserted from time to time that he would take such a step. If the Senate persists in treating the consular service as spoils, American commercial interests will turn to the President with redoubled appeals to rescue it.

Since the Washington air is surcharged with rumors of American expeditions to be landed at Canton or Shanghai, San Domingo or mayhap Venezuela, the report of the army Genera' Staff in regard to our lack of transports is very enlightening. It is published by Senator Gallinger as part of his argument for the ship-subsidy bill, thus showing that the General Staff has civilian uses as

well as military. Over against the grim threats a week ago of landing Gen. Funston and two brigades in China in the twinkling of an eye, the General Staff admits frankly that to move a force corresponding to our present military establishment "would require practically all the American shipping of suitable character in Atlantic waters, and more than the entire tonnage in Pacific waters." Most Americans, we fancy, will regard this lack of army transports as far from an undesirable state of affairs. If it will only keep the present Administration from plunging into oversea adventures, it is a condition to be tolerated. At least, it should make the Government see how impossible would be any offensive war with a great Power. Even if Senator Gallinger and the other subsidy men could, by enriching private ship-owners, create a great fleet of available transports, the question of coaling, provisioning, and landing abroad would still be impossible of solution, on a large scale.

Gov. Higgins's reasons for fearing an investigation of the various departments of his Administration, especially Insurance and Banking, are painfully obvious. Nobody is in the least deceived by the shallow pretext that the Legislature has no legal right to investigate. Such paltry quibbling is unworthy of a high-school debating society. There is one reason and only one why the Governor of New York dreads publicity: He knows, as every one else knows, that his two personal cronies and political supporters, Hendricks and Kilburn, are either dishonest or grossly incompetent. Their presence in office is a public scandal and offence; but they command so much influence that Higgins dares not touch them till their terms run out. The Fiscal Supervisor of Charities, H. H. Bender, is resorting to every technicality in order to escape the consequences of his violation of the civil-service laws; but the Governor is too timorous to move against him. The Corporation Tax Bureau rests under specific charges of venality, but the Governor wants to keep the Legislature from interfering. The shocking revelations secured by the Armstrong committee have roused suspicion against the whole Administration—notably the Railroad Commission; yet the Governor dreads to clean house or to have any one do it for him. He would rather have the State government stew in its own corruption.

The rejoicing of this country over the unprecedented steel exports in the month of December would mean more if we knew the prices at which these consignments of metal were disposed of abroad. It is not such a remarkable achievement to sell goods of any kind, even in the largest quantities, if one is willing to put the price low enough, and some other customer stands ready to bear whatever loss may accrue. How, as a matter of fact, did the purchasers of these rails and billets and structural materials fare by comparison with American consumers? It is not known exactly, but the details of many similar transactions are public property. Testifying before the Merchant Marine Commission a year and a half ago, for instance, James C. Wallace, then vice-president and since president of the American Shipbuilding Company, said:

> "Recently one of our largest steel mills sold abroad 100,000 tons of steel plate. They delivered it, I understand, at Belfast at $24 a ton. That would practically mean, with ocean rates as they are, $22 a ton at tidewater. They are charging us to-day at Pittsburg $32 a ton."

If such a difference existed with reference to the 52,000 tons shipped from Eastern ports alone in December—leaving out all consignments from Southern and Pacific Coast points, it meant a discount of approximately a half-million dollars in a single month to the foreign purchaser. But, of course, all the excess price paid by the home consumer goes straight to the pockets of honest American workingmen, and they, and not the Trust, would suffer were Congress to equalize this by a change in the tariff.

The late President Harper of Chicago University habitually deprecated the fame he had attained as a money-getter, and would have chosen to be remembered by the innovations he framed in university administration and teaching. It was these that fairly gave him his nickname, "the business president." Efficiency was his watchword long before it was Lord Rosebery's; and most of his peculiar policies were based on the conviction that our traditional methods of higher education are backward and time-wasting. Thus, at the outset he abolished the long vacations, or, rather, made them optional with students and professors, continuing the University terms throughout the calendar year. This permitted the diligent student to shorten his course, the provident instructor to accumulate vacations beyond the regulation three months, and required the occasional recruiting of the faculty by temporary (quarter-year) appointments from outside. All these changes were in the direction of flexibility. Again, when it was discovered that the University of Chicago lacked college life and spirit, college life and spirit were straightway improvised, or at least encouraged, by the appointment of a famous athlete to the faculty, and later by the building of dormitories. No detail of university life escaped President Harper. He urged the duty of frequent publication and a discreet publicity upon his professors, as he did that of enthusiasm upon his students. To slow methods of incubation he was temperamentally averse, whether it were a case of a scholastic *magnum opus* or of alluring the minor colleges and universities of the Middle West into feudal relations with the University of Chicago. When one considers the actual accomplishment of his fourteen years' tenure, it must be admitted that rarely has so much thought and energy been thrown in an equal time into a similar work.

The colleges are at last making athletic reform hum. At Harvard the overseers have forbidden football to be played until the rules are changed to their satisfaction; Yale is said to be willing to desert the old Rules Committee; at Union, football has been abolished, and, strange to say, by vote of the students; the University of Wisconsin has faced the athletic problem broadly by instructing its delegates to the Western conference to vote for the suspension of intercollegiate contests. Everything indicates that the agitation is serious, and that this time something will be done. Meanwhile, it is wise to distinguish between athletic abuses that are a result of American conditions in general, and those that pertain to any particular branch of sport. The much-advertised reform of football should be regarded as merely a beginning of a new dispensation in college sport generally. It might, theoretically, be possible to impose upon interlocked rushlines the leisurely affability of so many "floorwalkers," and yet the inflated expenditure, the overcrowding, the generally exaggerated excitement attending the games would persist. The remedy, for the present, lies in a reduction of intercollegiate games to the minimum, and in encouraging sports within the colleges. By this means, the field demonstration of the effect of new football rules, which President Eliot is said to desire, could best be effected.

London's first pollings destroy the last hope of the Tories, that they might yet escape disastrous defeat. If they cannot save their seats even in London, it is all up with them. In 1900 the Tories carried 55 out of the 62 metropolitan constituencies; at the present rate they may win barely 20. And the Liberal triumph goes on mounting throughout the country. Seat after seat reckoned securely Tory has been snatched. Mr. Balfour's brother Gerald went down at Leeds on Monday, and another member of his Cabinet, the Secretary for Ireland, Mr. Long, was beaten at South Bristol. Even Liberals must regret the defeat of Lord Hugh Cecil and Gibson Bowles. Both were ornaments of the House for industry, wit and character, and the debates will be duller for their absence. The fact that both these Unionist free-traders owed their defeat to a Chamber-

lainite running independently against them, will further embitter the party against Chamberlain. His plight is pitiful. Hard on to seventy years, and with a Liberal Government before him good for four or five years, his dream of becoming Prime Minister on the protection issue must now have vanished.

Tory as for the last twenty years Manchester has been, Saturday's polling shows that it is still loyal to the fundamental doctrine of that school of political thought to which it gave its name. In the Corn Law days it was Liberal and Radical. Nearly seventy years ago, when Gladstone was not yet twenty-eight, and when he was fast becoming what Macaulay, a couple of years later, called him, the rising hope of the stern and unbending Tories, Manchester would have none of him. In 1837, in consequence of the death of William IV., Parliament was dissolved. Gladstone was put up for Manchester, but he was left at the bottom of the poll. In the next half-century both the statesman and the city changed position. Gladstone, first a Free Trade Conservative, then a Liberal, had for the last thirty years of his life, in the eyes of his Tory opponents, all the seeming of a dangerous Radical. Manchester, thoroughly and uncompromisingly Liberal so long as Protection in any of its forms was at all a political issue, drifted towards Conservatism when Free Trade had been, as it then seemed, definitively won.

Even before the great Liberal leader's championship of Home Rule had split his party elsewhere, Manchester had passed over to the Tories. At the election of 1885, when Parnell was still ordering his followers to vote against every Gladstonian candidate, the Conservatives carried five of the six divisions of Manchester. Since then their party has never held less than one-half of its seats, and, for the greater part of the time, of its six members only one has been a Liberal. At the election of 1900 there was no Liberal candidate at all for Northwest Manchester, the very division for which Winston Churchill was on Saturday returned by a majority of 1,241. Six years ago, in the other five divisions, the aggregate Conservative majority was 6,000 in a total vote of 41,000. On Saturday every division was contested. There were upwards of 57,000 votes returned. Mr. Balfour and every other Conservative candidate were beaten, and the aggregate Liberal and Labor majority was 13,000. For the first time since the passage of the Reform Act of 1868, no Conservative will sit in the new Parliament for the great cotton metropolis. In proportion to the total vote polled, the overturning in Manchester is as great as that which would be required to turn McKinley's plurality of 143,000 in New York in 1900 into a Democratic plurality of 325,000 in 1906. It may be noted in passing that, though the total vote was much the heaviest ever returned in Manchester, it is only about half that which is cast at a warmly contested election in an American city of the same size. Manchester has about as many people as St. Louis or Baltimore. In 1900 the former cast 125,000 votes, and the latter 113,000.

Forty-one writers, artists, and scholars in Germany have memorialized their English colleagues for a better understanding between the two nations. They regret extreme anti-British expressions made in Germany during the Boer war, and they protest against false and reckless statements in the British press which embitter relations and render most difficult the task of peace-making that lies before the Morocco Conference. These Germans maintain that the two nations have been and are bound together by reciprocal ties of culture, religion, art, and scholarship, and bespeak a setting aside of prejudice and a more cordial recognition of the solidarity of British and German civilization. To such an overture of good will but one answer was possible. Forty-one British worthies promptly welcomed this open letter, and responded with counter expressions of friendship, and with sincere deprecation of "the affected belligerency of some of our journals." Such an interchange of good wishes must in a measure make against the chauvinism that equally afflicts both nations; and if it be said that these pacific sentiments are adopted only by certain *intellectuels*, without influence upon the masses, one can only reply that international understandings have historically always begun among this educated class.

To show that the German protest against unfriendly treatment by the British press is not made without reason, we cite a characteristic instance, not from the yellower precincts of the Strand, but from the *Times*. Shortly before December 27, the German Emperor, speaking in a private gathering, denied that there was a war party behind him, professed the most pacific intentions, praised the "tact and firmness" of M. Rouvier in the thorny Morocco negotiations, and declared that the "most conciliatory instructions" had been given to the German Ambassador at Fez. This most welcome news was forwarded by the *Times's* Paris correspondent under date of December 27, and printed briefly as a "rumor." Next day the Paris correspondent had his doubts. The alleged Imperial statement was purely unofficial. A "trustworthy source" had provided a supplementary clause, in which the Kaiser had subordinated his zeal for peace to the maintenance of national honor. There were reports of military preparations on the railroads near the Belgian frontier. The third day, the Imperial utterance being officially confirmed, the Berlin correspondent points out that it means no essential change in attitude; the Paris correspondent finds that the overture "does not appear to have made any impression on the French public—at all events, not the kind of impression which was apparently intended"; this, that, and the other Paris journalist remain skeptical. A formula based on this case would run as follows: Subject all news creditable to German good sense and feeling to these three operations: (1) Print it without emphasis; (2) question its authenticity; (3) if that be established, minimize its value and challenge its sincerity. Evidently the gospel of peace itself would come off badly in the *Times* office under the application of this rule of three.

Count Witte's answer to his critics might be in the words of the French statesman when asked what he did during the Reign of Terror: "I lived." The Russian Premier has survived an unparalleled series of risings against the powers of government, and, if order does not reign in Warsaw and Moscow, chaos at least has not taken its place. He has not, it is true, won over the antagonists who distrusted him when he assumed office. Even semi-official papers, like the *Slovo* and the *Novoe Vremya*, continue to speak of him as a juggler; reactionaries and bureaucrats detest him; Moderate Liberals and Conservatives give him but guarded support, while Radical Liberals concede to him at best the ability of a Necker, with all the limitations of the French financier. "Witte's ideal," says Prince Kropotkin, "is a liberal, half-absolute and half-constitutional monarchy, of which he would be the Bismarck, standing by the side of a weak monarch. He will not be a great statesman, because he scoffs at those who believe that in politics, as in everything else, complete honesty is the most successful policy." Witte himself has deplored the fact that only the revolutionary elements in Russia seem to have a common purpose, while the friends of order are divided and unwilling to support the Czar and his Government. To foreign criticism of the arbitrary acts of his Ministry he replied: "Foreigners, in truth, do not understand Russia at all. Before the events of last October they were agreed that all would be well as soon as a Constitution was granted. Now they are frightened because everything appears to be in disorder. As a matter of fact, their anxiety is just as exaggerated as was their previous hopefulness."

CONGRESS ON ROOSEVELT'S HANDS

Without accepting too confidingly all the stories that come from Washington, it is evident that the relations between the President and Congress are strained. From the beginning of the session things have not gone smoothly. The Administration programme has visibly stuck on the ways. And a personal element has contributed to the tension: many Congressmen have taken offence at Mr. Roosevelt, for one reason or another, and do not conceal their pique. That the President himself has lost something of his customary amiability, we may believe without depending upon the gossip, partly amusing, partly disquieting, which is traceable to recent callers at the White House. Mr. Roosevelt's message to Congress last week was one long burst of ill temper. It argued a frame of mind poorly fitted either clearly to perceive the actual situation in Congress, or to deal with it.

President Roosevelt obviously suffers from never having served in Congress, and so caught something of its point of view. Next to his lack of legal training, his frequent inability to hit off the tone of a representative and legislative body is perhaps his greatest handicap as President. Only think of McKinley's unfailing skill in that regard! He had an instinctive feeling for the Congressional way of looking at all questions, and seldom failed to adjust himself to it with the nicest tact. Whenever he stroked Congress, the resultant purr was audible; but Mr. Roosevelt seems usually to rub the fur the wrong way, and to elicit such angry spittings and clawings as we now see. It is a defect at once in his experience and his temperament.

The trouble between President and Congress springs partly from the old curse of patronage. Even in the hands of a President who had been a zealous civil-service reformer, that governmental evil has lost little of its power to work mischief. Exasperated Senators and inflamed Representatives are as thick in Washington as in the days when the spoils system frankly reigned. And the worst of it is that the President appears to be using the arguments of a spoilsman at the same time that he is professing to make appointments in the spirit of a reformer. That is to say, in his efforts to aid Speaker Cannon in rallying a party majority in the House, the President urges, appeals, and threatens, on the ground of patronage, just as a McKinley or a Grant might have done. This is happy neither way: it does not satisfy or appease Congressmen; it does not make reform appear either strong or consistent.

Behind patronage, policies. Some of those which the President is backing are distasteful to Congress. While dear to Mr. Roosevelt's heart, he cannot arouse public enthusiasm about them, because the public is almost wholly indifferent. Where is the evidence that the people care a straw about San Domingo? The President's Panama troubles are likewise a matter largely between himself and Congress; the public cannot be made excited about them. Thus Mr. Roosevelt is left to fight those quarrels unaided. The old heart-filling hurrahs from the people do not come to spur him on. Meanwhile, the causes upon which he might have appealed strongly to the general sentiment of the country are held in abeyance. The Machiavellian "railroad schemers" whom Mr. Roosevelt's friends so often see in affrighted visions, must be chuckling over the way in which the railroad-regulation bill has been subordinated to San Domingo, Panama, Mr. Bishop, and Mrs. Morris.

One cause of President Roosevelt's impatience with Congress is his consciousness of being still the people's darling. There is no sure sign that his popularity has diminished appreciably; he even added to it by his part in bringing about peace between Russia and Japan, last summer, and by his tour through the South; how, then, dares Congress to withstand him? But there is an old political truth which Mr. Roosevelt does not appear to have sufficiently weighed. This is that an Administration, no matter how strong it may seem in popular support, no sooner begins to live than it begins to die. Mr. Cleveland perceived this in 1892. Shortly after his triumphant election in that year, he wrote a letter to Mr. Lamar which predicted the troublous days of his coming Administration, and which is a monument to his political sagacity. A President once in office, and pledged as Mr. Roosevelt is not to seek another term, becomes a more negligible quantity than he likes to think. Political interest soon centres elsewhere. Who is to be the successor? What faction, what machine of the many which are assembling their parts, is to force the next nomination? Those are the instinctive questions of politicians who always hasten to prostrate themselves before the rising sun. They are doing it in Washington to-day. So many Presidential booms are in the making that the authority of the President who has been made is necessarily impaired. Congressmen are more anxious to be "solid" with Fairbanks or Shaw, Foraker or Taft, Root or La Follette, than to wait upon orders from the White House every day. It is this scheming within the party which partly accounts for the President's inability to whip it into line for his pet measures. And when we add to that the inveterate and unyielding greed of the protected interests, against which the President's Philippine bill has run as against a stone wall; the disposition of Congressmen selfishly to consult their individual political fortunes more carefully than the President's; and Mr. Roosevelt's ill-judged acts and utterances, we have little difficulty in explaining the coil into which he has got himself with Congress.

It would be rash to prophesy that he will not pull himself out gracefully, or at least victoriously. He has immense resources; real political skill; proverbial good fortune. Once fairly in a corner, he knows how to yield with a smiling face, and claim a great triumph. So it is possible that the present war-clouds on Capitol Hill will roll away; but meantime we are to have a severe test of the President's political generalship.

THE PRESIDENT AND THE BOSSES.

Current rows and heartburnings at Washington over Federal patronage raise again the whole question of the complicity of the National Government in fastening the tyranny of corrupt bosses upon States and cities. Mr. Wayne MacVeagh, in his *North American* article on the triumph of honesty at the polls in Philadelphia, points to the extraordinary fact that the whole effective power of the Administration at Washington was against the reformers. This was because the President had allowed the Pennsylvania Senators to dictate all the appointments. Consequently, though Mr. Roosevelt might express sympathy with the good cause privately, and though Secretary Root might openly wish the honest citizens of Philadelphia godspeed in their efforts to oust "a corrupt and criminal combination masquerading under the name of Republicans," the whole force of Federal officials was working night and day to save the bosses from the wrath to come. Mr. MacVeagh states, in dwelling on the "alliance between the Executive Department of the National Government and the bosses cynically engaged in despoiling Philadelphia and Pennsylvania," that "almost every person in Pennsylvania who had been honored with a commission bearing the signature of President Roosevelt, was the avowed, persistent, and reckless opponent of that decency and honesty in politics for which President Roosevelt has so courageously battled all his life."

That is sorrowful history. The lamentable present fact is that the same process is apparently in full vigor once more at Washington. In meekly knuckling to the demands of Senators in the matter of appointments to office, Mr. Roosevelt is, by so much, declaring himself in favor of the rehabilitation of the bosses. Ever since last November's election the question of thoughtful citizens has been: "Shall we be able to secure the fruits of the people's victory? Are the smashed machines to remain in fragments, or will they be put together again and set running more remorselessly than before?" Well, the repair gang has called upon the

President for aid, and he is giving it to them.

For example, note the significance of his throwing just now an extra appointee to Senator Beveridge of Indiana. It is promptly and properly taken as a favor to the Beveridge machine. The newspapers are beginning to reckon up how many "men" the Senator now has on guard. Thus, we read in the Washington *Post* of Thursday:

"With this appointment, Senator Beveridge will now have in the Federal building at Indianapolis the following personal appointments: Judge Baker, of the United States Circuit Court of Appeals; Judge Marsh, pension agent; Elam Neal, collector of internal revenue; H. W. Bennett, postmaster; Mr. Pettit, United States marshal, and Mr. Rothschilds, surveyor of the port."

We are far from asserting that Senator Beveridge is a corrupt politician. He has, it is true, shown a pretty taste in spoils. With Scriptural zeal, he has insisted that the Government provide for those of his own household. We suppose, however, that he wishes to create and control a machine more for political than for pecuniary objects. Yet the same vicious system is illustrated in his case, tolerably innocent though that may be, which in Pennsylvania, in Illinois, in Ohio, in New York, and New Jersey has fixed upon those Commonwealths and their chief cities a ruthless organization of plunderers.

Let there be no mistake about this. A local boss, just in proportion as he is cunning and corrupt, reaches out his hand for Federal patronage. It is not, of course, his smirched palm that is thrust into the President's face; a respectable Senator is sent to do the asking. But we all know how endless are the affiliations, the plottings, the secret influences, the threats, the bribes, the trickeries, the betrayals of the boss. Nothing is too small for him to attend to; nothing too large for him to aspire to control. His "system" works up and down through all the commercial and political life of his State. It was easy for Quay to get "eminent bankers" or "distinguished jurists" to back his pet scoundrels. Writes the blunt Mr. MacVeagh: "What Mr. Jerome has recently said of some of the judges of New York, is eminently true of some of the judges of Philadelphia and throughout Pennsylvania, in all the grades of our judiciary." The machine knoweth its own. Having created judges and Senators, it calls upon them to fall down and worship their creator. The messenger to the White House may be a Senator, but the principal is waiting in some secret office, miles away, with his ear to a telephone, anxious to learn whether the President has made one more place for a serviceable tool. When Senator Dick was demanding a consulate last year, what surgery could have dissected out his real personality from that of Boss Cox? In Pennsylvania, Penrose and Durham were blended indistinguishably. The President could not smile upon the Senator without fawning upon the Boss.

Here in New York we see the peril threatening. In the room of the deposed Odell, it is proposed that Aldridge or Woodruff be set up. Either would soon make Odell seem fairly respectable. In any case, the restoration of the New York machine with a new boss is buzzed about all over the State, and the implication is that the President will turn over the desired patronage. The Senatorial intermediaries do not count with us just now, but it will not be long before the new machine has its errand-boys in the Senate, and then the question will be whether Mr. Roosevelt will help forge anew the chains of political slavery for us. He will do it infallibly, just as he will do it in other States, if he abdicates his Constitutional function in favor of the Senate. No overmastering desire to obtain legislation from that body—as to which he may easily be betrayed again—should blind him to the fact that the surrender of the power of appointment to Senators means giving fresh courage to the bosses everywhere. The very best fight against the return of the crew which the people spoke their minds so emphatically about last November, would be made by a Chief Executive who should point clamorous boss-made and boss-allied Senators to the Constitutional provision: The President shall nominate."

ONE WAY OUT OF THE PHILIPPINES.

Congressman McCall has revived a plan to get this country out of the Philippine difficulty. He has introduced a resolution authorizing the President to enter into negotiations with the Powers of Europe for the purpose of making neutral territory of the Philippine archipelago, with an independent government recognized internationally. This proposition would spike the guns of those who are seeking, on one pretence after another, to tie us up to the Philippines indefinitely for purposes of commercial exploitation. It has been their favorite contention that if we should withdraw from the archipelago, Japan or Germany or some other Power would immediately pounce upon the prey. For us to permit any such aggression, it has been alleged, would be nothing less than a breach of faith with the Filipinos, for no other country could possibly have such humanitarian motives as ours.

What Mr. McCall proposes can be assailed on the ground neither of precedent nor of feasibility. Switzerland and Belgium have long been neutralized by international agreement. Switzerland would in all probability have been absorbed by envious neighbors had it not been that her perpetual neutrality and the inviolability of her territory were guaranteed in 1815 by Austria, Great Britain, Portugal, Prussia, and Russia. No nation has ever tried to violate this agreement, and none would be allowed to. The same is true of Belgium. In 1831, Great Britain, France, Russia, Austria, and Prussia settled the quarrel between Holland and Belgium, provided for the separate existence of the latter, and declared it to be thenceforth a perpetually neutral state. When the Belgian frontier was menaced by the war of 1870, Great Britain served notice that she would take sides against whichever combatant should violate Belgium's territory. This warning was enough. Neither France nor Germany cared to bring England into their strife.

This idea that a territory can be put beyond the reach of land-grabbing Powers by national agreement, has by no means been overlooked in the years since 1831. The United States, by the Monroe Doctrine and its subsequent interpretations, has practically assumed to do that very thing for South America. Later, Secretary Hay, in his efforts for the open door in China, induced the great nations to promise to keep their hands off China during the war between Russia and Japan. And the Portsmouth treaty of peace, together with the new Anglo-Japanese pact, has practically neutralized China for a long time to come. Mr. McCall's suggestion is therefore in line with our best traditions as well as in accord with the historic American spirit of fair play towards those who are weak. Its adoption would free the future of the Filipinos from uncertainty. More than that, there is not a single obstacle in the way of an international agreement. Japan and England would welcome it as simplifying the Eastern problem in which they are deeply concerned, while the German Emperor would undoubtedly seize the opportunity to show once more his genuine friendliness towards the United States, and confute those Jingoes who, ever since the blunders of his Admiral Diedrichs in Manila Bay, have insisted on his hostile intentions. France, Russia, and Italy could also make no possible objection. Indeed, if Mr. Roosevelt would but bring to the task a tenth of the astuteness, enthusiasm, and energy which he applied to the Russian and Japanese peace negotiations, the matter could be carried through within the year.

But the hitch, it may be said, will come over the proposed independent government. Secretary Taft will be certain to rise up once more and solemnly argue that no man must utter the word independence out loud and couple with it a promise or a date. But there are signs that his party has got well beyond him. His own specially organized excursion to the Philippines failed to arouse enthusiasm among its members. If President McKinley could return to earth he would be astounded at the change in sentiment. He would hear many party leaders privately wishing

the islands anywhere but in our care. He would be surprised by the number of Imperialist newspapers, like the Minneapolis *Tribune*, which are heartily sick of the whole business; and would find Congress in a sad snarl over the simple question of giving the Filipinos a chance to export their sugar and tobacco free of any tax. But far more significant is the total absence of any real interest in the Philippines in the current debates. Mr. Taft and the President may appeal all they please to the honor and generosity of Congressmen; the latter want nothing except to wash their hands of Philippine affairs.

In this hurly-burly, Mr. McCall's proposal should fall gratefully. The fact that it is fathered by a Republican Congressman and is to have the endorsement of Senator Crane in the Senate, will relieve from the charge of party irregularity any Republican who speaks or votes for it. Best of all, it can be said for the neutralizing plan that it would be an act of justice, relieve us from the expense and worry of maintaining troops, forts, and fleets to guard them, and enable the Filipinos to begin to govern themselves at once, free from interference, no matter how many times they may stumble and fall before they learn to stand on their feet.

DARIUS GREEN'S PROGENY.

In one respect, at least, the development of the art of flying by human contrivances has been unique. General public interest was not aroused in steamboats until one was able to propel itself; there was never a public view of the telegraph until it was so perfected that messages could be sent by it; and most other inventions, whether small or great, have been given to the world when they had been made workable, and not before. But the progress toward a practicable flying apparatus has all been made in the open. Inventors have, of course, carried on their experiments with the customary privacy, but as each one has worked out only some small part of the problem, the public has been enabled to watch substantially every step. The Aero Club's exhibition, which opened in this city on Saturday evening, has thus one entirely novel aspect. It is, in a sense, an assembling, from all parts of the world, of the constituent elements for an invention which has not yet been made, namely, a machine that will fly after the fashion of a bird.

The steering of balloons was at first the only problem that aeronauts considered practical. According to the accepted physical formula for determining the sustaining power of a column of air, a bird the size of a duck would have had to expend the better part of a horsepower to keep itself off the ground; and to lift a man, let alone an engine, by means of wings or planes, appeared absolutely visionary. Only rural "cranks," of the Darius Green order, seriously tried the thing. Then came the series of experiments that not only exploded the old formula, but showed it to be comparatively easy to construct an engine that will lift its weight against the air. Sir Hiram Maxim constructed a large apparatus with wide supporting planes and rotary propellers which could be started along ordinary rails, and, when it reached a certain speed, would rise so that its wheels ran along the under side of another set of rails placed above the first. The assumption then was that if such a machine were launched in a spacious enough place, it would fly, and the difficulty of finding such a place in England was the reason why the inventor paused.

As a matter of fact, the question of balancing, which was then considered a secondary matter, has since been realized to be the crux of the whole problem. Otto Lilienthal, who met his death in pursuit of his hobby, studied the art of soaring from a height by means of rigid wings that were elevated or depressed merely by the balance of the operator's body. Professor Langley of the Smithsonian Institution has made several models that "flew," but it was too erratic flight that wrecked his last creation, the "Buzzard." The success of the Wright brothers in controlling aeroplanes has received much notice in the last two years, and their invention has just been bought by the French Government. So progress has been made in the art of actual navigation as well as on the purely mechanical side.

In the meantime, Santos-Dumont and his disciples on both sides of the water have brought the dirigible balloon to such perfection that it will run against a very light breeze, and in still air can perform any evolution. Of course, the gas-filled airship is a fundamentally different thing from a craft which rises by its own power; but the experimenters with the former have been steadily lightening their motors, and every reduction in the number of ounces per horsepower is a help to the work of the other group.

"Man will be able in due time to soar after the manner of the eagle, which utilizes the energy of the wind against which it flies for its own propulsion." This is the prediction of Prof. Alexander Graham Bell, one of whose kites only this month performed the feat of lifting, thirty feet above the ground, a 185-pound man with tackle weighing 62 pounds. Professor Bell's device has never yet been made a part of an airship or been combined with an engine and propeller, but it is unquestionably one of the most important inventions yet made in connection with the conquest of the air. On the lines followed by the pioneer inventors, it might be possible to make a small apparatus practicable where a large one would fail. With a given design, while the sustaining power increased with the square of the dimensions, the weight would increase with the cube. Even the box-kite, with which many experimenters have worked, requires bracing whenever several kites are bound together, and increases in weight faster than in lifting power.

Professor Bell's tetrahedral kite overcomes this objection. It is merely a frame of six sticks of equal length fastened at the corners so as to form a triangular pyramid. Two sides are covered with some thin fabric. Each of such units is absolutely firm and stable, needing no additional bracing; and they can be bound together in any desired number without impairing their efficiency. So, according to the published studies, the lifting power increases exactly as the weight. Ten units weigh ten times as much as one and will lift ten times as much. There would seem to be no theoretical obstacle to constructing such a kite or aggregation of kites capable of lifting any given weight into the air. If a man and his chair, why not a motor and propelling fans? Should this turn out to be the solution of the problem, the flying machine of the future will bear the appearance not of one great bird, as it is commonly figured, but of a flock of little birds, for that is what the photographs of the Bell kite most resemble.

Kipling's navigators of the twenty-first century are made to speak disparagingly of the days when men "flew kites over thorium engines." It looks as if commonplace steam and vapor engines would have to come first. But even that stage is awaited with impatience. We have seemingly accomplished the preliminaries; but who will be the man to make the airship as practicable as the automobile?

PAYING THE DOCTOR.

When a New York dentist was said to have charged Prince Louis $1,000 for filling four teeth, the general comment, public and private, was that the bill was outrageous. The question of doctor's fees is raised again by correspondence printed in a recent issue of the *Medical Record*. A New York surgeon asked $1,000 for an operation for gangrenous appendicitis; the mother of the patient, after consultation with friends, offered $600. The surgeon politely protested, cited testimony of brother physicians to prove that his fee was not unusual, and finally received the remainder. The letter enclosing the last check ran thus:

"My discussion with you has been a friendly one, and so you will not, I am sure, suspect me of any acrimony when I say that my feeling about the present excessive charge of surgeons is a very general one, and the reflection of a sentiment that is

everywhere one of surprise and dissatisfaction. We do not question your ability, but we feel you make us pay too dear for it."

Indubitably, the writer of the letter just quoted voices a common sentiment; and that sentiment is not without basis in fact. Some surgeons seem to have adopted the motto, "Your money or your life." They charge a patient as much as they think he can possibly afford. This, of course, is refined and intelligent highway robbery. On no theory whatever can it be defended. There are, however, certain principles, perfectly clear, though not always well understood or consistently applied, which explain why a twelve-minute operation for appendicitis may be worth more than five or six hours of tooth-filling.

In the first place, all professional fees are graded according to the standard of living in the community. In small cities and villages the doctors, dentists, and lawyers, often extremely skilful, would never dream of asking what New York doctors and lawyers regularly ask. Surgeons in Poughkeepsie, Albany, New Haven, and Springfield can probably remove the appendix as successfully as any one in New York, but they might charge their richest patients no more than $500, aud possibly as little as $150. People who are unfamiliar with New York prices are therefore aghast at the thought of fees which hardened New Yorkers take for granted; and the voices of these strangers within our gates help to swell the chorus of complaint.

Moreover, the position of a doctor differs widely from that of a lawyer or engineer. The latter are not called upon in crises of life and death to give their services freely. Every surgeon of standing devotes much time and energy to hospital practice and cases in which his fees are merely nominal. As a humane man he cannot do less. He expects and his patients expect that he shall partly reimburse himself from those who can afford to pay handsomely. Physicians as a class are not consumed with greed. The vast majority set professional honor and their services to mankind above other considerations, and are content with a moderate return for their labor. A surgeon is entirely warranted in fixing a maximum fee, say, $1,000, or even more, for appendicitis, demanding this maximum from his rich patients, and charging others less, according to his private judgment as to mercy and justice. By this we do not mean that when he saves the life of a millionaire he shall capriciously set his figures in the thousands or tens of thousands, but that his maximum shall be determined seriously and honestly.

In such a reckoning he may often take account of factors which a layman (as the correspondence already referred to shows) might overlook. The element of time, for instance, is often relatively unimportant. A physician carries a child through an ordinary case of measles in three or four calls, and charges for each call. In a prolonged but not grave illness he may not deem it quite fair to charge rigidly for every call. For a twelve-minute operation for appendicitis he properly asks far more than for the hours spent over measles or mild lingering sickness. The seriousness of the malady, the difficulty and risk of the operation, and the skill and previous medical training required must all be considered. A painful flesh-wound from an accident may take five times as long to heal as an incision for appendicitis; the surgeon may dress it daily for weeks; and yet the flesh-wound may never threaten life itself, and the treatment may be so simple and easy that it demands from the surgeon nothing but attention and average knowledge. An abdominal operation may—thanks to extraordinary special knowledge, acquired at great expense—be so quick and brilliant that, though the patient has literally been snatched from death, he and his friends may imagine that nothing much was the matter. He is subjected to less inconvenience and agony than he might suffer from having four of the most workmanlike gold fillings put in his teeth. The bills, however, should not be the same.

THE FUNCTION OF AN ENDOWED PRESS.

Rumors are current that one of our greatest universities is soon to be endowed with a press; if so, let us hope it will be put to good use, for it would be altogether hasty to assume that a university press is of necessity a blessing, and dangers of the most obvious kind are readily to be foreseen. It may, for one thing, become the servant not so much of learning and education as of the institution it represents; it may be run, in plain words, to advertise the university and to push its graduates. The evil is evident in the gross, but extends far in subtle and demoralizing ramifications. Such a policy would, for instance, incidentally tend to encourage the promiscuous printing of doctors' theses, and foster the spirit of hot-bed forcing that is the chief cause of the immaturity and crudeness for which too much of our American scholarship has made an unfortunate reputation. Closely akin to this is an evil not unknown even to the Pitt and the Clarendon Presses. These institutions enjoy the special advantage of knowing beforehand the subjects to be set for university examinations, and they suborn young scholars whose time might be far better and hardly less remuneratively spent, to prepare text-books for these examinations. With our system this could not so largely be the case; yet who can doubt that text-books and doctors' theses might easily become the chief product of such a press?

There is another danger, even more grave, that requires statement at some length, for it opens up the whole subject of the teaching of literature at our universities. Yet this is no incidental matter, for the press, after all, is the greatest of the teachers of literature. Under the influence of men with much special but little general education, work would probably be published unworthy of a university in its standard of expression It is perhaps an indirect result of the present extraordinary effort in the teaching of English and literature that both teachers and learners, to say nothing of those who are neither teachers nor learners, have measurably lost sight of what literary expression is; whence their ill success. One of the most deplorable things at our universities is to see men who profess literature, consciously or unconsciously setting before their students the idea that literary expression is an end to be achieved by direct study, and which may be turned to commercial advantage. But literary expression is nothing more than a means to an end: it is the employment of the symbols of written language in the manner most closely adapted to conveying thought. We must learn to think first, and after that learn to convey what we have thought. Most of our teaching, however, is how to express ourselves regardless of the cultivation of the intellect, and this teaching is carried on with such intensity that thought which should be stimulated by literature is, on the contrary, crushed out by it.

Literature under this system tends to become a specialty. The masterpieces of English prose and verse are no longer the sacred repositories of the highest thought of our race, claimed by every educated man as his equal birthright; they are delegated to specialist educators—the term is a fit one—as instruments for technical study and preferment. At many, if not all, of our universities, English literature is already suffering from undiscriminating specialism, and many of those engaged in other pursuits affect an often comforting disdain for literary expression as a matter that concerns some learned colleague, but not themselves. They forget, those who have ever known it, that a clear thought can be crystallized only by a clear expression. And so, to leave generalities and come to particulars, we find that even in the study nearest akin to that of literature, namely, that of history, something distinctly worse than bad style is winked at and, on occasion, encouraged. Is it safe, under such circumstances, to trust a college faculty with a press?

And yet the need for an endowed press is crying. To enumerate all the good purposes it might serve would be to exceed the unavoidable bounds of this ar-

ticle, and only one will be adverted to, one not generally recognized and yet perhaps most important of all—the production of serious literature at a low price. It is one of the weaknesses of our Anglo-Saxon civilization (for in this matter the argument applies to England even more than to ourselves), that whereas the price of newspapers, of magazines, and of fiction has steadily tended downwards, such has not been the case with what may be described conveniently as serious literature—literature that ranges from poetry through history to philosophy. How seriously our national position is affected may be shown by a comparison with France. That country happily has a standard price of publication, 70 cents a volume, at which the bulk of current literature, both light and serious, is produced. Bourget's latest novel and Henri Houssaye on Waterloo appear on the bookstall side by side and at the same price, and as often as not the good Paris bourgeois purchases the more valuable book. And to say that this is simply because French serious literature is better written than ours is an enormous exaggeration, as may be demonstrated. A few years ago a London publisher set out to produce a translation of the complete works of Nietzsche. The first volume met with little encouragement; the second was accompanied by a slip from the publisher stating that unless the public responded better he would have to abandon the enterprise; the third has never appeared. In France, all of Nietzsche's works have long since been translated, and the least sold had run some years ago into several thousands.

Here we have not a question of style, but of price; not of the positive value of Nietzsche, but of intellectual curiosity. And here we get a rough demonstration that in France, with less than forty millions of people, there are probably from five to ten persons who buy serious books to one in the English-speaking countries with nearly four times the population. If that is so, if it is only approximately so, it is a terrible reproach to our civilization, and it is largely the result of the inflated prices charged for new works of serious literature. It should not be forgotten that the class of the community which buys, or might buy, such books, is one that feels very keenly the difference between paying less than a dollar or from two to six dollars. In Paris the publisher who should raise his price would lose his public; in London or New York the publisher who should lower his price would find the public unprepared and irresponsive. From the publishers there is nothing to hope, for the present, save cheap reprints of works out of copyright, but might not an endowed press, working with steady policy over a course of years, help us? By inflexibly demanding adequate literary expression, by standardizing its prices at a low figure, by giving unknown authors a chance on their merits, by supporting scholars in difficult but little-trodden paths, it might serve a great national purpose, and in time shake the publishers and the public out of the vicious rut into which they have insensibly slipped.

THE MODERN LANGUAGE ASSOCIATION OF AMERICA.

HAVERFORD, December, 1905.

The experiment of holding a meeting of a learned society in a small town is generally regarded as hazardous, but in the two cases in which the Modern Language Association has tried it—at Charlottesville, Va., and this winter at Haverford, Pa.—the result has been most satisfactory. The total attendance, though smaller than the gatherings in New York, Cambridge, and Baltimore, has been quite up to the average; while the proportion of members actually present at the sessions has been larger than usual, and, most important of all, the opportunities for social intercourse have been better than they ever can be amid the varied distractions of a city. About half of the members, this time, chose to take rooms in the Philadelphia hotels, which can be reached almost as readily from Haverford as from the University of Pennsylvania; the others were comfortably housed in the college dormitories. Meals were served on the grounds, and a fine club-house offered everything that the most exacting taste could require. Reduced railway rates added to the general cheerfulness.

Many of the visitors this year were attracted, no doubt, by the prospect of hearing an address from Professor Gummere, president of the Association for 1905; many, too, were interested in seeing a college so highly esteemed yet so little known. Neither of these expectations was disappointed. The presidential allocution consisted, as had been generally hoped, of an exposition of some of Professor Gummere's views concerning the production of ballads. This kind of poetry, being in its origin essentially a game or an outgrowth of the dance, is naturally dramatic rather than narrative; it portrays a single scene, and develops its theme by a process that is aptly called "incremental repetition." In conflict with this congenital immobility is the world-old love of story-telling, which tends to transform the ballad into a little epic, substituting a complete tale for a self-explanatory situation. A delightful feature of the address was the reading of ballads illustrating the two types.

It is safe to say that few of the outsiders left Haverford without a twinge of envy for those colleagues whose lot is cast in this homelike little college. Beautiful grounds, extending apparently as far as the eye can reach, where the happy professors dwell, untaxed, in a friendly community of their own, enjoying all the pleasures of rural life within easy reach of a great city; adequate but unpretentious buildings; a comfortable endowment, which makes it possible to offer unusual inducements to exceptional men; a sensible administration, a small but well-selected corps of instructors, a choice and not overlarge body of students; a high standard of scholarship, combined with a total absence of vulgar boastfulness and blatant advertising—these advantages make Haverford a model of what the little college should be. Would that more institutions had the same opportunity and could follow the same enlightened policy!

The programme was of evenly good quality. Constant attendants at the Association meetings have noted, from year to year, a marked improvement in the choice of subjects and the presentation of them. There are now none of those intolerable bunglers who do not know what they have written and cannot read their own handwriting; there are few of those enthusiasts who have to be gently plucked by the coat-tail at the expiration of their allotted twenty minutes; and there are not many of those microscopic specialists whose work is too technical to be followed even by a scientific audience. The regulations adopted some years ago prevent crowding and leave plenty of time for debate. Discussion, this year, was abundant and lively, and the repose of somnolent members was full of interruptions. Of the twenty-two papers read, not one could be called feeble; scarce half-a-dozen were really uninteresting—and even these were so well written and so convincingly delivered that the hearers half believed they understood. Six or seven were sufficiently general to entertain any educated public. All the papers but one dealt with literary topics, and that one was of a purely popular character. English literature naturally predominated, but French and German were ably represented, and there was an agreeable sprinkling of other languages. A welcome surprise was the appearance of a lady among the readers. One striking feature of the programme was the size of the Cambridge delegation; nearly half of the speakers were men now or formally connected with Harvard. Equally striking was the absence of any direct offering from Johns Hopkins. We may see in these facts evidence of a notable increase in productivity at Harvard, without (let us hope) postulating a corresponding decline in Baltimore. Contributions were made by twenty-one colleges or universities, scattered across the continent from Montreal to the Pacific Coast; only one, however, came from the South. The papers actually read were divided among fourteen seats of learning.

The two that called forth most comment were "American Speech," by Mr. Leigh R. Gregor of McGill College, and "The Prosody of Walt Whitman," by Prof. F. N. Scott of the University of Michigan. Mr. Gregor took as his starting-point Henry James's address "On the Question of our Speech," and, in the form of a highly amusing dialogue between John Bull and Brother Jonathan, discussed with great sagacity the chief linguistic differences between England and America, dealing impartially with the shortcomings of both; he then considered the possibility of maintaining separate standards for the two countries, and the chances of a final reconciliation through mutual concessions. Professor Scott demonstrated that Walt Whitman's poetry was by no means an impetuous production, but was the fruit of long experiment, thought, and study. Collecting all the poet's utterances about his art, he noted Whitman's belief

that prose is a more elastic and less conventional form than verse, his susceptibility to large, free movements and rushes of sound, his fondness for the swaying, gliding effects that characterize rhythmic prose. Following his previously published theory that prose rhythm is essentially a combination of pitch variations, while verse rhythm consists in sequences of varied stress, Professor Scott showed that Whitman's prosody "is an attempt to construct with the units of prose rhythm a pattern similar to that which other poets had constructed with the materials of metre." This thesis was illustrated by readings and comparisons. It may be added that Professor Scott evidently does not regard Whitman's creation as likely to have any lasting effect on English poetry. Among the other papers, mention should be accorded to Dr. W. W. Lawrence's "Structure and Interpretation of the 'Widsith,'" a masterpiece of argument and presentation, and Dr. Karl D. Jessen's penetrating study of "Margaret Fuller's Criticism of Goethe."

In 1904 there was presented to the Association the "Report of a Joint Committee, representing the National Educational Association, the American Philological Association, and the Modern Language Association of America, on the subject of a Phonetic English Alphabet." The proposals of this body, though approved as a whole, were criticised in some details, and a committee of five, consisting of Professors Sheldon, Grandgent, Bright, Hempl, and Weeks, was appointed to revise the work. The new committee reported at this meeting, suggesting certain modifications in the alphabet, which make it simpler, more logical, and less divergent from other systems. The report was unanimously adopted; similar action was subsequently taken by the Philological Association, in session at Ithaca. The plan is to urge all makers of dictionaries and text-books to use this alphabet in indicating pronunciation; and some hope is entertained that, as the public gradually becomes accustomed to the phonetic notations, the logical spelling may ultimately replace our traditional orthography. The new alphabet is well adapted to both these ends, being easy, clear, systematic, and not too outlandish in appearance. The prospect for phonetic spelling now seems brighter than ever before. The Association also voted approval of "the proposal to hold an international conference of experts in phonetics for the purpose of considering a uniform method of graphic representation of the sounds of speech."

The president for 1906 is Prof. H. A. Todd of Columbia. The Association has received from President Hadley an invitation to hold its next meeting at Yale.

THE AMERICAN ECONOMIC ASSOCIATION AT BALTIMORE.

BALTIMORE, January 4, 1906.

The eighteenth annual meeting of the American Economic Association was held with the Johns Hopkins University in Baltimore during the Christmas recess, jointly with the American Political Science Association, and simultaneously with the sessions of the American Historical Association. In large and representative attendance, in sustained interest and spirited discussion, and in general helpfulness to the science and its devotees, the meeting was one of the best in the history of the Association. It is hoped that the social arrangements were found agreeable, and that the opportunities for personal contact and informal intercourse were adequate.

The general plan of the meeting was the selection of five general topics—Economic Theory, Regulation of Railway Rates, Municipal Ownership, Labor Questions, Economic Future of the Negro—and the assignment of one session to the consideration of each such topic. In most cases two papers were submitted, presenting the respective sides of the matter in controversy, which were discussed first by designated persons, and thereafter, to the amount of time available, by the general meeting. On the whole this plan, to which the Association has for some years been steadily drifting, worked admirably. In some instances the issue was drawn too narrowly, and academic calm in at least one instance was replaced by unnecessary warmth. But the discussions were more unified and profitable.

The opening session of the meeting on Wednesday morning, December 27, was devoted to Economic Theory. Prof. Jacob H. Hollander of Johns Hopkins University presented a formal paper on "The Present State of the Theory of Distribution," and this was discussed by Profs. John B. Clark of Columbia University, William M. Burke of Albion College, Charles A. Tuttle of Wabash College, Roswell C. McCrea of Bowdoin College, Frank A. Fetter of Cornell University, and Simon N. Patten of the University of Pennsylvania. After pointing out that the theory of distribution has been the primary endeavor of economic inquiry during the largest part of its systematic pursuit, and briefly outlining the development of the doctrine, Professor Hollander stated that the theory as now current is discredited by two recognized criteria of scientific progress—(a) practicable applicability, and (b) agreement as to fundamental principles. This deficiency is due less to incompleteness of result than to the use of inappropriate method. Three conceivable methods may be employed by the economist in his search for a theory of distribution, conveniently distinguished as: (1) Historical; (2) Metaphysical; and (3) Analytical. Whatever hope may have been entertained as to the usefulness of the historical method in constructing a body of economic doctrine, was born of reaction. The metaphysical method is a mean between closet speculation and dialectical hypercriticism bearing insufficient relation to the concrete facts of economic life. The analytical method, on the other hand, assumes that the details of economic distribution are capable of observation, arrangement, and classification; that when so arranged they reveal certain uniformities, that these uniformities may be formulated as hypotheses, and these hypotheses may be demonstrated as laws. It is the method of positive science capable of application to every field of systematic study other than the purely philosophical disciplines. The successful use of the analytical method by the economist has been delayed by the absence or inadequacy of necessary material required by the deductive student for his actual synthesis and for his ultimate verification; by the inductive investigator for his essential subject-matter. The corrective proposed, therefore, by Professor Hollander is an arrest of further text-book didacticism, an abandonment of hypercritical dialectics, and a reduction of metaphysical speculation, as the exclusive apparatus serviceable in search for the law of economic distribution, to a minor rôle. Measurably in lieu thereof, and largely in connection therewith, was suggested a detailed systematic acquaintance with the actual contemporary subject-matter, as the preparation and equipment for its scientific interpretation.

President Taussig's address on Wednesday evening, on "The Love of Wealth and the Public Service," was a notable departure from the narrower limits of economic theory and practice into the broad field of social philosophy. He undertook to consider the motives that actuate able men in the conduct of large industrial enterprises, and the possibility of enlisting in greater degree the services of such men in the administration of public business. The complex desire for wealth was analyzed into four constituent elements: first, love of ease and comfort; second, desire for distinction; third, the impulse to activity; fourth, the passion for power and mastery. The most potent of these forces, the impulse for achievement and for mastery, finds nothing attractive in the administration of public affairs in consequence of the peculiarities of the political machinery of our own country. Not until our political life offers some reasonable chance of prolonged tenure and substantial power, will it attract men of the needed stamp. Even thereafter, all the elaboration of more effective governmental apparatus will prove useless unless the public really wishes for better government.

As to the ultimate outcome, President Taussig ranged himself unhesitatingly on the side of the angels:

"Our political machinery is improving, and is likely still further to improve. The worship of wealth is diminishing, and the respect for public service is increasing. Men of character and capacity will win, in the long run, the suffrage of the people, and corruption and jobbery will be rebuked. The fundamental virtues are not lacking, and we may base upon them our devices for enlisting high-minded ability, for raising general intelligence, for bettering the working details of government. We may expect that the sphere of public enterprises will be enlarged, as the lessons necessary for the successful conduct of such enterprises are learned. We may hope for greater repression of the selfish motives and the sordid activities, for freer play to noble ambition and public-spirited effort, and not only for a stronger government, but for a better and purer democracy."

The session of Wednesday afternoon was devoted to "Railway Rate Regulation," with Hon. Martin A. Knapp of the Interstate Commerce Commission in the chair. Prof. Hugo R. Meyer of the University of Chicago and Prof. B. H. Meyer of the State Railway Commission of Wisconsin were scheduled to present the opposed sides of the question in issue, and Prof. Frank H. Dixon of Dartmouth, Mr. L. G. McPherson, lecturer on transportation at Johns Hopkins, Prof. Don C. Barrett of Haverford, and Prof. Willard C. Fisher of Wesleyan undertook to discuss the papers. As a matter of fact, the inspiration of environment was overpowering, and the announced

topic was relatively neglected. "The Chicago Meyer" paid his respects in emphatic terms to the record of the Interstate Commerce Commission, and "the Wisconsin Meyer" prefaced his formal paper by a spirited and direct arraignment of the statements and citations of the preceding speaker. Some such conflict was perhaps inevitable, but the profit of the discussion suffered.

The interest of current affairs was reflected by a joint session on Thursday morning with the American Political Science Association, devoted to "The Case for and against Municipal Ownership." Principal papers were presented by Mr. Frederick C. Howe of Cleveland and Prof. Winthrop M. Daniels of Princeton University. Thereafter a vigorous and competent discussion was carried on by Prof. Leo S. Rowe of Pennsylvania, Prof. John A. Fairlie of Michigan, and Dr. M. R. Maltbie.

Labor questions engaged the attention of the meeting on Thursday afternoon. Prof. H. W. Farnam of Yale presented a quantitative study of the labor movement in new groupings of the statistical data made available by the United States Commission of Labor, and suggested a larger use of diagrammatic apparatus and exhibits in the publications of that body. United States Commissioner of Labor Neill took part in the interesting discussion which followed. The second formal paper of the session was by Prof. Thomas S. Adams of the University of Wisconsin, on the extent and tendency of violence in strikes, and this was entertainingly discussed by a social philosopher in the person of Prof. N. P. Gilman, of Meadville; by an economist, Dr. George E. Barnett, of Johns Hopkins, and by a labor leader, Mr. William B. Prescott, ex-president of the International Typographical Union.

In keen interest and actual substance the closing session of the meeting on Friday morning, devoted to "The Economic Future of the Negro," left nothing to be desired. Mr. Alfred H. Stone of Mississippi and Prof. W. E. B. DuBois of Atlanta University read the principal papers, and Prof. Charles L. Raper, of the University of North Carolina, Mr. Theodore Marburg of Baltimore, Prof. M. B. Hammond of the Ohio State University, and Mr. R. C. Bruce of Tuskegee submitted minor communications. Manifestly here was a group of men qualified in very unusual degree to speak upon the matter under discussion, and, with barely an exception, the papers were positive and acute. But the contrariety of opinion—indeed, the opposition of facts—was so marked as to depress even the most optimistic believer in the possibility of a "solution" of the negro question. On the one hand, the black was shown to be a thrifty, reasonably industrious peasant, whose standard of life rises rapidly under favorable conditions; and, on the other hand, he was characterized as a besotted degenerate, from whom neither progress nor even stability may be expected. The session was barely rescued from utter agnosticism by requesting the Executive Committee of the Association to consider the propriety of a committee to collect facts bearing upon the industrial position and prospects of the negro.

Two business meetings of the Association were held, at which the constitution was so amended as to replace the overgrown Council, as a governing board, by a somewhat enlarged Executive Committee. The affairs of the Association, as reported by its officers, were found in prosperous condition. Progress was also made in the long-considered plan of further publication activity. Prof. J. E. Jenks of Cornell University was elected to the presidency; and Prof. W. M. Daniels succeeded secretary-treasurer Fetter, whose long and efficient service received appreciative recognition. The association adjourned to meet at Providence, with Brown University, in the Christmas recess of 1906. J. H. H.

Correspondence.

OUR FAULTY MONETARY SYSTEM.

To the Editor of The Nation:

Sir: The editorial in the current issue of the *Nation* (No. 2115) upon Mr. Schiff's warning is eminently sound and pertinent. Nevertheless, neither it nor Mr. Schiff's remarks, as it seems to me, quite touch the root of the evil, so far as our banking and monetary system is concerned. That evil is inherent in the system as at present constituted. It is undoubtedly true, as you have pointed out, that the recent stringency in the money market is attributable, not to the working of our Sub-Treasury system, bad though that may be, but to the locking up in Stock Exchange speculations of the free loanable capital upon which the commerce of the country is dependent. It is also true that "this autumn's episode" is "a disgrace to a civilized community," and to the banking fraternity in particular.

But what are the bank managers to do? As certainly as the summers come around, does this loanable capital, temporarily freed from use, accumulate upon their hands. They pay interest upon it—with rare exceptions; unwillingly, it may be; but of necessity because their competitors do so. The country bankers, having no use at home for their accumulations, send them to the cities, where they get interest upon their balances at a rate not governed by market conditions as in other countries, but fixed for the entire year. The banks in the smaller cities, being similarly situated as regards the plethora of loanable funds, pass their surplus along to the larger cities; and they in turn deposit theirs with the banks in New York. What, then should the New York bankers do under these circumstances? Refuse to take the capital on deposit and pay interest upon it? That would be the wise and prudent course, but it is a course they dare not take. Self-interest interposes. The few who perceive the danger are helpless; should they turn away deposits for which their rivals are clamoring, they would injure their own business without relieving the general situation.

This capital—deposits or credit balances, as they call it, or "money," in the parlance of the Street—must be forced into use regardless of the difficulty, if not the impossibility, of withdrawing it when needed for the active commerce of the autumn and winter. If, in their effort to find employment for the "funds" thus committed to their charge, the bankers play into the hands of the millionaire speculators, they are not so blameworthy as it may seem when viewed from without. These speculators are among the very best customers of the banks; they carry the largest balances without interest; they offer the most readily marketable security; they control, directly or indirectly, many sources from which the banks derive profitable business. Moreover, the purpose for which loans upon collateral are negotiated, is not, as a rule, known to the lenders. Even the personality of the borrowers is commonly hidden when brokers are employed. Nor is this all. Much of the borrowing is from individuals, trust companies, insurance companies, and also from banks in other cities. But, whoever the lenders, the pressure comes upon the New York banks, where the credit balances are carried.

From their intimate relation to the financial transactions that pass through their hands, the bankers cannot plead ignorance of what is going on in the field either of legitimate business or of speculation. But individually they are not free agents; the working of the system is more powerful than they are. Collectively, they do not act; the number of independent rival institutions precludes concerted action even for the protection of themselves and the general public. What is needed is radical reform in both our banking and currency systems. As now constituted, our banking system may aptly be compared to a high-pressure boiler under full and steadily increasing duty, but without a safety-valve. Such a safety-valve would be afforded by a bank currency like that of the Canadian banks. By contracting automatically when commerce slackens, it would put pressure upon the banks at the season when it is needed, thus preventing in large measure the excessive accumulations that are now such a fruitful source of trouble. But, to be stable, such a currency must be issued by large institutions under stringent provisions as to redemption, and careful supervision in other respects; to work smoothly and efficiently it calls for branch banking. It thus involves a sweeping change in our present system—if system it can be called—of several different kinds of banking institutions, all pushing each other into more or less unsound practices, but pulling apart and forcing disaster when a crisis becomes imminent.

Commenting editorially upon Mr. Schiff's address, the Chicago *Record-Herald* remarks, concerning proposed remedies, that "the differences of the experts are very perplexing to the lay mind." The cause of these differences is that most of the bankers, few of whom are really experts on these matters, are blinded by self-interest or fear. Therefore, poor makeshift propositions are put forward, though fathered and supported by weighty names. Even those who see clearly what should be done assert that it is hopeless to try for it, since the country bankers, to a man, are set against branch banking. There is force in the argument they adduce, that no system is proof against the consequences of bad management; but a bad system, such as that we now have, compels wrong practices, which under a good system would as inevitably be discouraged. Frederick W. Gookin.

Chicago, January 14, 1906.

THE CANAL AND THE COST.

To the Editor of The Nation:

Sir: If the Panama Canal is opened for traffic in ten years, and has then cost us, including interest, which is already running, $500,000,000—which seems not an improbable amount—then at four per cent. the interest on the cost will amount to $20,000,000 annually. If the average charge for each vessel passing through is $4,000—about that of the Suez Canal—it will require the passage of 5,000 ships a year to meet interest charges alone. If $6,000 a ship is required, it would still require 3,333 vessels a year to meet interest charges. Is any such amount of traffic supposable?

Moreover, the cost of maintenance cannot of course be estimated at less than $1,000,000, more probably at $2,000,000; and to meet this alone, at an average of $6,000, would require the passage of 333 vessels.—Yours, H. A. P.

Cambridge, Mass., January 13, 1906.

Notes.

A. C. McClurg & Co., Chicago, have in preparation 'Hawaiian Yesterdays,' by Dr. Henry M. Lyman of Chicago, a missionary's son, who now presents his boyish recollection of island life.

In the course of the present mouth Messrs. Bell & Sons will publish 'The Itinerary in Wales of John Leland in or about the years 1536-1539.' The editor is Miss L. Toulmin Smith, who is already well known to students of English on both sides of the Atlantic. In this volume are gathered together and arranged the portions relating to Wales scattered through four parts of Leland's works; the place-names are identified, and there is a map and a full index. The book is intended to form part of a new edition of Leland's celebrated 'Itinerary through England and Wales,' upon which Miss Smith is still engaged.

In the *Globus*, R. Lehmann-Nitzsch announces that Mr. E. Antran of Buenos Ayres recently found in the heart of the Argentine Republic twenty-eight unknown letters of Alexander von Humboldt. They were addressed to Bonpland, and have been handed down in that naturalist's family as a portion of his literary remains. They are to be published in the near future in connection with the posthumous writings of Bonpland. A preliminary report on the whole find has been made public by Ed. L. Holmberg.

The Royal Association of Sciences in Copenhagen and the Academy of Sciences in Berlin have agreed jointly to prepare a catalogue of the Greek and Latin medical writers. The ulterior purpose is to submit this to the International Association of Academies with a view to having a complete and scientific edition of all the medical works of classical antiquity prepared and published. The next convention of the International Association, to be held in Vienna in 1907, at Whitsuntide, is expected to take definite action in the matter.

After the present year the works of Heinrich Heine will no longer be protected in France, where copyright extends fifty years after the death of an author. The *Gaulois* declares that interest in Heine is still growing in France, and the demand for his works now greater than ever.

Probably the first edition of Goethe's poems to be issued in Japan made its appearance recently in Tokio from the publishing house of K. Nakane, in a volume of 244 pages, embellished with a portrait of Goethe and a reproduction of the well-known picture, "Goethe's Familie." The author is Tadao Hashimoto, already known for an early edition of Heine and for his advocacy of the study of German literature; and, besides the poems, in the German letter, there are translations of some forty-eight of Goethe's best-known ballads and lyrics, with explanatory notes in Japanese. The translations, in Japanese verse, do not, of course, satisfy the metrical conditions of the original. In his introduction Mr. Nakane presents the question, What is the character of the poetry of Goethe which has been so much praised? For his part he finds in the poems of the German Olympian unusual vigor, fulness of life, an earnest spirit that is always a confession of the soul, a mysterious strength and calmness that yields sound like that of music, abundance of touch with human life, simplicity of style, and a form that is in strict accord with the content. The editing of Goethe's works, Mr. Nakane says, was a labor of love, undertaken for the youth of Japan, who are as yet quite unfamiliar with the poet. There is also a preface to the work by a friend of the editor, who styles himself *Chiku-fu*, or "The Wind in the Bamboo," and who compares Goethe to a kettle into which all kinds of metal have been poured and melted to effect his unique genius. The Japanese, says *Chiku-fu*, are very fond of Heine, whom they know rather well, but he is only a sort of *shuju* or "Confucius-disciple" of Goethe, and between Heine and his master there is as much difference as between earth and heaven.

Two more volumes in the Arthur H. Clark Co.'s reprints, "Early Western Travels, 1748-1846," embrace three interesting narratives; the longest, Gregg's 'Commerce of the Prairies (1802-1839),' being also the most valuable—indeed, a well-established classic, accurate and well written. This author describes the barbarous New Mexican sport of *correr el gallo*, which still survives (or did up to the civil war) in our Southern States as "gander-pulling." Gregg has also a brief section on the Mormon settlement in Independence, Mo., but has most to tell of the aborigines and the fauna of their country as observed by a veteran trader of the Santa Fé Trail. A New Bedford Quaker, George W. Ogden, relates his experiences as tourist and sojourner in the Ohio Valley, 'Letters from the West, 1821-23.' The common sights of slavery on the Southern side of the river draw from him strong expressions of humane displeasure as well as of pride in his sect's testimonies against slavery; he devotes a closing section to this subject. W. Bullock, an intelligent Englishman, keen for natural curiosities for his museum, supplies a 'Journey from New Orleans to New York, 1827,' which has for its chief feature (though of minor interest) a description of Niagara Falls.

Various causes have delayed our noticing three sumptuous folio volumes which we owe to the courtesy of the State Department of Mexico, entitled 'Mexico: Its Social Evolution.' Plain "History" would have answered as well as "Evolution," as the publishers (Mexico: J. Ballescá & Co.) seem to feel. The original composition was in Spanish, in 1899, for the close of the century; and the retrospect has been thought worth translating into English. It was popularly conceived and entrusted to many hands, as is usually the case in such album works; and this involved some repetitions, witness the Mexican war, to which there is a return under "The National Army." The most valuable chapter we judge to be that on "The Public Treasury," so large a factor in Mexican history of the past half century; and with it we should couple the chapter on "National Education," though it is one of the most poorly translated. The work was set up and printed in Barcelona, and while literal errors are comparatively few, a faulty idiom throughout makes reading difficult, to say nothing of the Spanish literary habit, which manifests itself in needless abstractions and verbiage. The lack of a general index is to be regretted. There are two folding maps of Mexico, one for her railroads, and a great profusion of process illustrations of a high order, including numerous portraits. From these last and from the architectural views Americans may acquire a chastening respect for the civilization of our Southern neighbor.

The books on Egypt written since the great Napoleon virtually rediscovered it, and his savants for the first time tried to describe scientifically its physical features and archæological treasures, would fill a large library. Some of them, like Eliot Warburton's 'Crescent and the Cross,' were written under the inspiration of an enthusiastic afflatus which gave a rosy color to the most commonplace scenes; but others, like H. W. Dunning's 'To-day on the Nile' (James Pott & Co.), were mere handbooks of travel. In a dahabiyeh, which was the only vehicle for travel on the Nile half a century ago, and which is still the most delightful, a traveller may dream away three months of delicious leisure and intellectual enjoyment while covering the same length of river as is ploughed in a fortnight by a steamer filled with a noisy, unsympathetic crowd of tourists, who are hurried from temple to temple and from tomb to tomb by a dragoman with a kurbash. The traveller in the dahabiyeh will take beside his Wilkinson, Maspero, and Budge, his Warburton and Prime and Amelia Edwards; but the tripper on the Cook boat or the Anglo-American steamer cannot do better than prepare for his journey by reading Mr. Dunning's popular but scholarly chapters on Egyptian history and mythology; and, as he rushes about, he will have no more than leisure enough to supplement and even to correct the harangue of the dragoman by Mr. Dunning's concise description of what he will see, for the physical fatigue of exhausting Egypt in a fortnight leaves neither time nor power for thought.

'Animal Heroes,' by Ernest Thompson Seton (Scribners), gives the histories of a cat, a dog, a pigeon, a lynx, a rabbit, two wolves, and a reindeer. The stories are more or less composite the author says, but are each founded on the life of a veritable animal hero. "A hero is an individual of unusual gifts and achievements.

Whether it be man or animal, this definition applies; and it is the histories of such that appeal to the imagination and to the hearts of those who hear them." Mr. Seton thus defines his subject and his literary aim. Probably few readers will unsettle their enjoyment of his stories over the question whether it is he or Mr. Burroughs that is right about the existence of animal heroes, or whether they see his animals in the light of his fancy or that of common day. He does touch the heart and the imagination, his methods are not sensational, his literary art is excellent, his knowledge is wide. Of all the modern nature students in whom the human interest in wild creatures dominates the merely scientific interest, he is, in Mr. Burroughs's opinion, the best, though with "romantic tendencies" that must be remembered when one reads his works as natural history.

Ernest Crosby's 'Garrison the Non-Resistant' (Chicago: The Public Publishing Co.) is in effect one of the now rather numerous minor biographies of that philanthropist. It is not, however, structurally organic; one part has, avowedly, been published before, and probably several. Thus, chapter v. is on "The Civil War," but also chapter x. is on "Garrison and the Civil War." There is much desultory discussion of whether war was the best way to end slavery, and of the politico-social results of the war at the South, disfranchisement, lynching, etc. This gives the little volume the aspect of a tract, but, if not strictly pertinent, it is often suggestive, as, conspicuously, the story of the Beast book at page 108. In the personal narrative there are several minor errors of fact, and at page 16 it is implied that the doctrine of immediatism was first urged by Garrison in the *Liberator* instead of in the *Genius of Universal Emancipation*. The apocryphal story of slapping a soldier on the back (p. 85) shows a defective criterion of testimony; slapping any one on the back was not Mr. Garrison's style. The point of view selected by Mr. Crosby is perfectly just, being fundamental; but, as a whole, his presentation cannot compare with that other, also of Tolstoyan non-resistant provenance, Tchertkoff and Holah's admirable 'Short Biography,' published in London in 1904.

Miss Ella Noyes, who contributed an excellent volume on Ferrara to the "Mediæval Towns" series, has written 'The Casentino and its Story' (London: Dent; New York: E. P. Dutton), a book in which picturesque description and historical reminiscence are pretty equally blended. The Casentino, it need hardly be said, is that beautiful region of the upper Arno, shut in by mountains, which abounds in scenery, old towns and castles, and in rich associations. Vallombrosa looks down into the valley on the west, La Verna, the rock of St. Francis, guards it on the east. Dante, who spent part of his exile here, immortalized the brooks of the Casentino in one line of "Hell," and fought in the battle at Campaldino. Here the Counts Guidi, Dante's friends and patrons, upheld the Ghibelline cause. Here St. Romualdo founded the first monastery of the Camaldoli. Miss Noyes describes all this, and much more, with enthusiasm. She has an unusual talent for making pen pictures of scenery vivid, and she seems to have overlooked none of the literary, artistic, or historical memorabilia of the valley. If at times her material is spun rather thin, that is a defect inevitable in works of this kind. The illustrations, by Miss Dora Noyes, really add to the interest of the book. There are twenty-five full-page sketches in color, and as many more line drawings which give the true Tuscan quality of scene, of tone, and of peasant life.

The Clarendon Press (New York: H. Frowde) publishes a very beautiful collotype reproduction of the Bodleian manuscript of Jerome's Latin version of the Chronica of Eusebius. The editor, Mr. John Knight Fotheringham of King's College, London, has written an Introduction and four critical appendices, showing most careful examination of the manuscript and thorough comparison of it with all others known to exist. Two other appendices, by Dr. R. L. Poole and Mr. C. H. Turner, add greatly to the interest of the publication. The appendix of Mr. Turner is a bibliographical study of Bishop Jean du Tillet of Meaux (d. 1570).

The December Bulletin of the New York Public Library contains a notable list of its works relating to woman in the several manifestations of her training, talents, occupations, and aspirations. One subdivision consists of a 'Dictionnaire de la Femme: Encyclopédie manuel des connaissances utiles à la femme' (Paris, 1877); an 'Illustrirtes Konversations-Lexikon der Frau' (Berlin, 1900); and a 'Dictionnaire des Précieuses' (Paris, 1856).

We have already announced the University of Chicago's two new periodical ventures, *Classical Philology* (quarterly) and the *Classical Journal* (monthly, November to June). The prospectuses now before us show in the editorship a very distinguished array of American scholars, impartially distributed among the universities, together with Prof. Wallace M. Lindsay of St. Andrews, Scotland. The managing editor is Edward Capps. We are told that "in so far as *Classical Philology* shall fulfil its object, it may . . . be looked upon as an offshoot of the *American Journal of Philology*, and as a witness to [Professor Gildersleeve's] influence upon American classical scholarship." The *Classical Journal* will be directed by the Classical Association of the Middle West and South, and will meet the wants of teachers. The managing editors are Gordon J. Laing and Arthur Fairbanks at the University of Chicago.

The Balkan conditions were graphically described by Mr. James Bryce in a recent address before the Balkan Committee, of which he has been president for three years. From the fact that he spent some weeks last autumn in Macedonia and Bulgaria, additional force was given to his statements. He said that there was no open war nor massacres on such a scale as those of two years ago, but in many districts isolated murders are frequent. "At present, no native's life or property is safe." As to the success of the new scheme for financial control, he could not express a confident opinion; but unless constant pressure is exerted to carry its provisions into effect, it will be of little use. "The local officials will do nothing unless such pressure is steadily applied. Indeed, they can do nothing; for what strikes one on visiting the country is that even the better officials—and sometimes the Turkish officials are honest, well-meaning men—can accomplish little, because they are thwarted in good or compelled to do wrong by orders from Constantinople." He emphasizes the absolute need of doing everything to induce the Christian races to abandon their guerrilla warfare, which is lamentable in itself and ruinous to their common cause, and profitable only to the Turkish Government, which does its best to foment the strife. If conditions are not improved it will be impossible to prevent a war between Bulgaria and Turkey.

The little mountain principality of Montenegro has entered upon a new era in her eventful history. Prince Nicholas has abolished the autocratic and patriarchal system of government which he inherited and has administered for forty-six years, and has substituted in its place a parliamentary system. In a proclamation issued last October, the opening paragraph of which asserts that "every man belonging to civilized society should be a free citizen," he calls upon "my gallant people" to select Deputies: "Let them assemble around me; I shall teach them their duties, and by our united action we shall bring about a great development of the liberties and prosperity of our country." On November 27 there was elected one Deputy from each of the fifty-six military districts and four towns; the Prince reserving to himself the nomination of six ministers of state and three ecclesiastical Deputies, representing the Orthodox, Roman Catholic, and Mussulman churches. Various reasons have been assigned by friendly and hostile critics for this extraordinary step on the part of the Prince.

The main causes of the present anti-foreign movement in China have been ascribed to Japan's victory over a European Power, the influence of Chinese students educated in Japan, and the leniency, interpreted as a sign of weakness, with which our Government has treated the boycott. A British merchant who has closely studied the situation during a recent business tour through the leading cities of China, calls attention (in a letter to the London *Times*) to another significant way in which the movement is being fostered by the Pekin authorities. The Dowager Empress not long ago issued an edict cancelling the old curriculum for the official examinations, and ordering examinations in Western learning in their stead, without, however, providing for the details of such a vital change in the established order of things. The result is that all those Chinese men of letters who, in the ordinary course of things, would have become officials, are deprived of their careers, and are converted into a mass of discontented men spreading all over the Empire. In addition, some 200 printing-presses, formerly employed in printing text-books and educational matter under the old system, are idle, and the employees are added to the malcontents. The writer points out that this state of things strongly resembles that produced by the reformed edict which preceded the Boxer outbreak of 1900.

Mlle. Dosne, the sister-in-law and heiress of Thiers, has presented to the Institute the famous historic Hôtel Thiers in Paris, together with the beautiful gardens surrounding it on the Place St. Georges, with the proviso that it is to be used as a

library of historical writings. The venerable lady, who is known as the editor of Thiers's 'Notes et Souvenirs,' has already established the "Fondation Thiers" for the stimulation of university students. The new gift is the famous structure that on two occasions, in 1870 and in 1871, was about to be demolished by the Paris rabble, and was saved only by being declared to be "national property." When the Commune was crushed, the demolition was already under way, and Thiers had a good deal of trouble in restoring the structure.

—Last July a weekly journal of reputable standing and wide circulation printed in facsimile, with an accompanying article, a part of a *Cape Fear Mercury* of June 3, 1775, containing resolutions purporting to be those adopted by a convention held in Mecklenburg County, N. C., on May 20, declaring independence of the crown of Great Britain. At first sight the article, written by one unknown among writers on history, S. Millington Miller, seemed a bit of midsummer madness, intended to amuse by an historical fiction. The tone of it, however, and the number of documents reproduced, carried weight, and aroused much interest in the South, where the tradition of such a convention and declaration has persisted for a century. The *Mercury* was sought by many, and large sums were offered for it if proof of its being genuine could be furnished. Finally, the Historical Commission asked Mr. Worthington C. Ford, head of the manuscripts division in the Library of Congress to study the newspaper held by Miller. His report was that the document was a forgery, a very clever one in its general manufacture, and that the evidence presented in support of it by Miller could not bear examination. It is hardly possible that a sale will now be made, but it is unfortunate that some steps cannot be taken to impound such a forgery and punish the forger.

—'The Bird Watcher in the Shetlands, with Some Notes on Seals—and Digressions,' by Edmund Selous (E. P. Dutton & Co.), is a summer continuation, made two years later, of the spring studies of little-known Northern sea-birds recorded in the author's 'Bird-Watching.' Mr. Selous has his own place among naturalists, by virtue of his unfamiliar fields, his originality of thought, and his power of giving to truly scientific matter the medium of a strong and cultivated literary style. This last distinction may well belong to a wilderness-lover and hook-lover, whose idea of an earthly paradise is "the veldt or Brazilian forests, or Lapland or the Spanish Marisma, with the British Museum library round the corner." A close student of nature and of Darwin, Mr. Selous is a kind of scientific free-thinker, a zoölogist without gun or cabinet, who goes afield prepared to see and to think. He unites with faithfulness of observation considerable boldness of speculative theory. He finds going on among individuals of certain species gradual change and differentiation, which he regards as stages of evolution; for instance, he believes that the influence of sexual selection is modifying the plain, dark Arctic skua into a beautiful light-colored bird. He maintains that the same influence has evolved the brilliant color of the buccal cavity of several Northern species, through the nuptial habit, common to both sexes, of opening wide the beak. He argues, too, for a process of inter-sexual selection—the male, also, exercising choice—in species of which the sexes closely resemble each other, or of which the sexes differ markedly and are both handsome. His studies of a guillemot chick and of the play and repose of seals are delightful, and show how a naturalist may have sympathy and imagination, yet refrain from too subjective an "interpretation." Altogether, the book commends itself for unusual suggestiveness and interest.

—'Daniel Webster, the Expounder of the Constitution,' is the title of a volume by Everett P. Wheeler (G. P. Putnam's Sons). It is at the same time a memorial by an enthusiastic professional admirer of Webster, and a convenient manual for any one who wishes to get in a small compass a view of Webster's career as expounder. Of the importance of the part he played in the development of our constitutional system there cannot be two opinions, and he will always share with Marshall the fame of having laid the foundations on which our existing régime has been built. By taking in their order the leading cases in which he was engaged, Mr. Wheeler is able to direct the reader's attention to all the great stages in Webster's forensic career, and bring out his extraordinary gifts and industry, as they reveal themselves to the sharpest of all critics—those of his own profession. Besides being a great Constitutional lawyer, he was a great publicist in any field to which he turned his mind, and no doubt a companion monograph equally striking, to those familiar with the ground, might be made from his diplomatic papers. Mr. Wheeler seems to think that as a statesman, also, his fame is or ought to be no less high than in either of the two more restricted fields, and he appears to believe that the Seventh of March speech illustrated only Webster's devotion to ideals, just as his argument in the Dartmouth College case illustrated his mastery of Constitutional law. This is not the common opinion, and not even Mr. Wheeler's zeal can make us believe that it will become so. We get here into the most contentious of all political arenas—that of a country brought to the verge of a civil war by a great historical abuse intrenched in its law and Constitution. Mr. Wheeler may be right in thinking that Webster's ideas about slavery were not essentially different from the very conservative views originally held by Lincoln, but Webster's conservatism helped slavery, while Lincoln's discovered a means to destroy it; Webster lost us the road, while Lincoln found it for us again. In great crises a public man's disposition is often of more importance than his ideas.

—'The Civil Service and Patronage' (Longmans, Green & Co.) is the title of a careful and useful historical study by Carl Russell Fish. The problem of civil-service reform has been treated not from the standpoint of expediency, but by giving fully the development of policy and practice as to patronage and the civil service, from the foundation of the Government to the present day. A final chapter is devoted to the present status of the civil-service reform movement. Not enough attention has been paid to the long agitation which preceded the adoption of the new system, and we do not clearly make out whether the author's examination should lead us to think that the vast number of unclassified positions will be brought within the rules by the natural progress of events, or that they are, under the operation of a natural law of politics, to remain "spoils." The considerations bearing on this are certainly important, both practically and historically, but they are not often adverted to. That the reform should have had the great success we see, although the agitation was devoid of wide popular backing, the author attributes to its inherently democratic character, and also to the fact that it is essentially a change in the direction of business-like management, which he thinks a feature of all American life to-day as compared with what was American fifty years ago. The old colonial founders knew what was a good civil service, and that it involved established tenure, by the instinct of a governing class of inherited traditions. We know it, because we are all more or less versed in business methods. Jackson and his cohorts, between the two periods, were barbarian hordes, who swept away the earlier civil service, and established the spoils system in government as barbarians establish it everywhere. If this view is correct, the optimist will look forward to all the unclassified offices being brought within the system; the pessimist, however, who thinks the root of our barbarism to be in universal suffrage (also a product of the middle period), will not be convinced until he sees it done.

—In 'Madame Geoffrin, her Salon and her Times,' by Janet Aldis (London: Methuen; New York: Putnams), we find a number of entertaining episodes and anecdotes concerning literary or other notabilities of eighteenth-century France compiled from the usual well-known sources mentioned in the bibliography, with the strange omission, however, of Sainte-Beuve. The personality of Madame Geoffrin is, indeed, almost obscured here and there, as we try to follow her in the throng of her guests, whom she admittedly ruled, directed, and even controlled with perhaps more adroitness than any of her rivals. Much care has been given to the coördination of events into, as it were, a moving picture of the time; and some of the chapters, such as the vicissitudes that befell the 'Encyclopédie' (ch. x.) and the imprisonment of Marmontel (ch. xiii.) are conducted with spirit and humor. The estimate of Grimm is somewhat inadequate and cold, for the Gallicized German proved his real worth in many delicate and trying circumstances. Revision by a trained French hand would have reduced errors of detail. *Maréchals* (p. xiii.) is neither English nor French; *blonde et blanc* (p. 37), *Harengs fraiscs* (p. 72), *devoté* (p. 87), *à dimanche* (p. 101), *cette homme n'est bon pas qu'à manger du veau* (p. 212) might be deemed errors in proof-reading, did we not find (p. 172) a passage which seems to indicate the author's belief that *quinconce* is French for "quince-tree." One may note that she makes no remark on the fact that the social power of women was never more gladly accepted than in the age which gave such influence the sanction of consent, not of legislative enactment.

—The German translation (by Richard Palleske) of the book on 'Iceland at the Beginning of the Twentieth Century,' by the Icelandic scholar and member of the Althing, Valtyr Gudmundsson, has, thanks to the difference in time of appearance, certain advantages over its original, even for those who read Danish with the same ease as German. The author gives here, in about 160 pages, a brief, but fairly exhaustive and profusely illustrated, account of Iceland's status at the beginning of the present century, with a synopsis of the development, during the last century, in population, public life, education, literature and art, finances, industries, means of communication, sanitary conditions, and charities. To this are added samples of Icelandic prose and poetry in German translation, as well as some hints for travellers in Iceland. Dr. Gudmundsson was the prime mover of that amendment in the Icelandic Constitution of 1874 which was finally adopted in the year 1903, changing the seat of the minister for Iceland from Copenhagen to Reykjavik. Iceland is a vast and barren country, but a large part of that lack of energy which seems to be characteristic of a majority of its population, must doubtless be ascribed to the unhappy conditions under which the people have lived, subject to the will of a foreign ruler and nation, who, when they have not been bent upon exploiting the country, as was the case in the eighteenth century, had only a slight understanding of and interest in the needs of the inhabitants. It is, therefore, interesting to note what progress the country has made since, in 1874, it obtained a sort of semi-independence, and was thus enabled to take such measures within its means as were most likely to advance the material and intellectual welfare of the people. Roads and bridges have been built, schools and hospitals have been erected, telephones have been introduced, the steamship connection with the outside world has been regulated, and a cable connection with Europe is in a fair way of being brought about. The population of the island was, in 1901, about 80,000, showing a considerable gain during the last decade, due to the fact that the emigration to America has almost ceased. There are in America (chiefly in Manitoba and North Dakota) about 20,000 Icelanders, who have here several churches and newspapers of their own.

SIR WEMYSS REID'S MEMOIRS.

Memoirs of Sir Wemyss Reid, 1842-1885. Edited, with an Introduction, by Stuart J. Reid. With portrait in photogravure. Cassell & Co. 1905. Pp. xxxvi., 396.

Wemyss Reid was notable as a literary man, a biographer, and a writer of fiction. But his Memoirs are chiefly important as those of the editor of the Leeds *Mercury*, a powerful paper of the moderate Liberal school in a stirring time. He flourished in what was perhaps the palmiest epoch of British journalism, when the editor of a great journal himself directed its policy and was a statesman of the pen, not a mere organist or the manager of a Yellow concern.

The Leeds *Mercury* was the property of the Baines family, a house memorable in its way. Edward Baines the first was a young printer whose gifts the original proprietor of the journal had recognized with the best results. Edward Baines the second, who afterwards edited the paper, was a politician as well as an editor. He sat in Parliament for Leeds, but lost his seat through the fanaticism of Prohibitionists, who, enraged at his moderation, voted against him, and as a result got a local brewer elected in his place. The Baines family were Liberals of the moderate school, Nonconformists and Puritans. As Puritans, they showed their faith by excluding from their paper, no doubt at a considerable sacrifice, betting news and theatricals. If their example in excluding betting news had been followed, the country might have been saved from one of its worst pests. The exclusion of theatricals was clearly a Puritan error. The theatre must live and have its influence. It is for the press to take care that its influence shall be moral.

Wemyss Reid was the son of a clergyman at Newcastle-upon-Tyne. He was sent to a school in Scotland, a circumstance to which we owe a charming little picture of a Scotch Sabbath (p. 6):

"It was on Sunday, however, that the full severity of the Scotch Puritanism of that day made itself felt in my inmost soul. Oh, the dreary monotony of those Sabbaths at St. Andrews! The long, long service and yet longer sermon in the forenoon, the funereal procession of the congregation to their homes, the hasty meal, consisting chiefly of tea and cold, hard-boiled eggs, which took the place of dinner, and the return within a few minutes to the kirk, where the vitiated atmosphere left by the morning congregation had not yet passed away. Even when the second service had come to a close, the solemnities of the day were not ended, for the Sunday-school met in the late afternoon, and remained in session for a couple of hours.

"But it was not the public services, terrible though these were, that formed the most depressing feature of Sunday in St. Andrews; it was the rigid discipline which pervaded her home life. My grandfather, I believe, was looked upon as being somewhat lax in his religious views, and he was undoubtedly more liberal—perhaps one might say more advanced—than many of his neighbors. Yet even he had to render homage to the universal law. So when Sunday came round, the blinds were closely drawn, lest the rays of the sun should dissipate the gloom befitting the solemn day, whilst no voice in the household was raised above a sepulchral whisper. Lucky for me was it that I was sent to bed early, and that thus the horrors of the Sabbath were in my case abbreviated. The older members of the family sat in a silent semi-circle round the smouldering fire, each holding, and some possibly reading, a book, the suitableness of which for use at such a time was beyond question. The Bible, the metrical version of the Psalms, and one or two volumes of discourses by divines of undoubted orthodoxy, formed the only literature recognized on these occasions. For myself, I had brought with me from home a copy of the delightful, though now-forgotten, book called 'Evenings at Home,' and my Sabbatical sufferings were intensified by the sight of this volume on a high bookshelf, where it remained beyond my reach from Saturday night till Monday morning."

Reid was at first put as clerk into a commercial house, but his aspirations were literary, especially journalistic. They were fulfilled. He became a reporter and a writer at the same time; then editor of the Preston *Guardian*, and at last of the Leeds *Mercury*. As a reporter he made a slip which might have been serious in reporting a speech of Lord Russell on the American civil war. Russell said that in the New World was seen that which had been so often seen in the Old World—a struggle, on the one side for independence, and on the other side for power. The reporter, being rather dazed, misconstrued the symbol for independence and made Russell say: "A struggle on the one side for empire and on the other for power." Fortunately, the misreport made nonsense. Gladstone's slip, which also occurred in a speech at Newcastle, might otherwise have been doubled.

The member of the Baines dynasty on whom the editorship of the *Mercury* naturally devolved, became a Plymouth Brother, or, as a lady by a slip of the tongue called him, "a Yarmouth Bloater." He deemed editorship inconsistent with his religious profession, and Wemyss Reid was taken in his place.

As the district organ of moderate Liberalism, the Leeds *Mercury* collided with the extreme Radical party, then headed by Mr. Chamberlain, whose principles the Tories compared, without much exaggeration, to those of Jack Cade. The first encounter was in the case of the Sheffield election (p. 210):

"At Sheffield a candidate came forward in the extreme Radical interest, whose speeches attracted some notice in Yorkshire, though they passed unobserved by the larger public beyond. This was Mr. Joseph Chamberlain, who now made his first attempt to win Parliamentary honors. Up to that moment I had only known Mr. Chamberlain as a young Birmingham politician, who was fond of saying things both bitter and flippant, not only about his political opponents, but about the older members of his own party. He had made himself one of the fuglemen in the cry raised against Mr. Forster, towards whom he seemed to entertain a feeling of almost personal antipathy. At Sheffield he made himself conspicuous by his sneers at Mr. Gladstone and almost all the recognized leaders of Liberalism. His own political opinions appeared to be based upon a crude and intolerant Radicalism of the Socialistic type. He evidently believed that promises of material benefits would enable him to win the support of the mass of the electors, and he conceived also that the best method of displacing his seniors in the party of which he was a member was to assail them with a rather coarse invective."

Mr. Chamberlain was then forming in each of the cities a Radical caucus to control the local politics of his party and nominate its candidate for Parliament; Birmingham being the centre of the whole, and the constructor of the Machine being its master, into whose hands the representation of the cities would thus have come. The extension of this mechanism to Leeds inevitably brought on a struggle between a master of the caucus and the editor of the organ of moderate Liberalism, in which Reid seems to have pretty much held his own. He was evidently a man of force, as well as of principle.

A special object of Reid's admiration as a type of moderate Liberalism was W. E. Forster, a man unquestionably of high principle and of solid qualities, prevented, perhaps, from rising to the highest place by his extreme want of social tact and uncouthness of manner. Forster, by taking a middle course on the subject of national education, had incurred the political hostility of Mr. Chamberlain and Mr. Morley, who were allies, as might be gathered, by negative evidence at least, from some passages of Mr. Morley's 'Life of Gladstone,'

Wemyss Reid states positively that the *Pall Mall Gazette*, edited by Mr. Morley, became virtually the mouthpiece of Mr. Chamberlain. It is very unlikely that Mr. Morley would have allowed the journal of which he was the brilliant editor to become anybody's mouthpiece but his own; still more that he would have allowed it to become anything like the instrument of an intrigue of a member of the Government against a colleague who was desperately struggling against disaffection in Ireland. We are to have some day a further instalment of Reid's Memoirs, with revelations of certain phases in the annals of the Liberal party which may be expected to throw light on the dark subject of the extrusion of Forster from the Cabinet.

Of John Morley, Reid says (p. 283):

"The charm of John Morley's manner, and the brightness of his talk, have been felt and acknowledged by all who have been brought into contact with him, and it would be superfluous on my part to say anything about his literary reputation. But I have always felt that neither his fine gifts nor his peculiar temperament were suited for the rough and tumble of political warfare. I have felt this whether I have been, as has often happened, marching behind him in thorough unison with his opinions, or, as has also occurred at times, directly opposed to him and to his policy."

Reid was perhaps not alone in this opinion. But the answer is that the "rough-and-tumble" element is sufficiently large to bear the infusion of a little high morality even in a philosophic form.

If Forster was Reid's demigod, Gladstone was his god. He has given us astonishing proofs of the great man's powers as a popular—it would be profane to say stump—speaker. At the election of 1880, Gladstone ran for Midlothian, which became the scene of a miraculous display of his oratorical powers. But his party at Leeds elected him there also, that in case of his rejection at Midlothian he might have a seat. He afterwards came to thank Leeds, and there spoke to an audience of thirty thousand people crowded into a temporary building literally to suffocation, so that holes had to be broken in the roof to give them air. The hubbub was deafening (p. 297):

"But suddenly Mr. Gladstone raised his hand, and it was almost as if a miracle had happened. In an instant there was a deathlike silence in the hall, and every man in it seemed to be holding his breath. The speaker's voice rang out, clear and musical as of old, and it reached to the furthest corners of the mighty apartment. But he had not got further than the conventional opening words when his audience seemed to go mad with delight. A frenzied burst of cheering, far exceeding that which had welcomed him on his first appearance, proclaimed the joy with which they had heard the voice of the man they adored. Again it was some minutes before Mr. Gladstone was allowed to proceed, but once more his uplifted hand ensured silence, and from that moment until he had reached the end of an hour's speech, every syllable that he uttered was heard distinctly by his thirty thousand listeners. It was, I think, the passionate eagerness of the audience to hear his voice, and their outburst of delight when its notes first fell upon their ears, that formed the most striking feature of that great meeting."

At the public dinner Gladstone was observed, before rising to speak, to cover his face for some time with his hands. Mrs. Gladstone afterwards explained that he had been praying, and that such was his habit. There can be no doubt that religion was to him a real motive-power and a support in all the trying moments of his life.

Other interesting characters appear, among them Cowen, the Radical philanthropist of Newcastle, champion of oppressed nationalities and of all victims of tyranny throughout the world. At Cowen's house Reid met the Italian revolutionists, among them Orsini, to whom Cowen unwittingly supplied the funds for the attempt on the life of the French Emperor. Reid was ravished with Orsini's personal beauty. Cowen was an eccentric man of genius and very eloquent, though he spoke with a Northumbrian burr, which he seems to have cherished as democratic, and which, when he had finished a splendid speech and won loud applause, gave Disraeli an opening for the supercilious remark that he was sorry that the speech, which appeared to have created enthusiasm, was in a language which he did not understand. There can be little doubt that Orsini frightened the French Emperor into going to war for the liberation of Italy—a rare instance of a good end attained by criminal means. The second instalment of the Memoirs, when it comes, is likely to be of political importance.

THE RUSSIAN CRISIS.

Russia and its Crisis. By Paul Miliukov. (Crane Lectures for 1903.) London: T. Fisher Unwin; The University of Chicago Press. 1905.

It is difficult to find words strong enough adequately to express the inestimable value of Professor Miliukoff's book for every one desirous of understanding Russia in the past, the present, and the future. It is hard reading—even hard to grasp as a serious text-book, which is its real character; but it will repay all the study that may be bestowed upon it. It lays bare the historical soul of the country, so to speak, in all its intricate recesses, which are, practically, inaccessible to a foreigner. In the present apparent topsy-turvydom and labyrinth of politics and party-combinations, it offers both the only and the all-sufficient guide, and demonstrates logical sequence, where both logic and sequence would often appear to be utterly lacking, by furnishing the historical clue. Moreover, it is illuminating in the highest degree, because of the apt comparisons instituted at various points between Russian and American conditions; and, being brought down to date, in effect (February 12, 1905), it offers the latest practicable information on general lines which can be required.

The author himself is the best type of modern Russian—learned, liberal, reasonable; neither a violent agitator nor a blind supporter of the autocracy whose inevitableness and gradual development from imperative conditions he so ably sets forth. His careful definition of the two (morally) distinct Russias now in conflict for the control is worthy of especial attention, in contrast with the unsatisfactory vagueness of similar attempts on the part of less well-informed and accurate thinkers. After stating them to be: the Russia of Leo Tolstoy, of the "intellectuals," liberty, the people, the future; and the Russia of Plehve, official, an anachronism deeply rooted in the past, despotism, he explains that Tolstoy's system of Christian anarchism merely stands as the synonym for liberty in general, the negation of absolutism only, not as a system in itself, since the "intellectuals" care little for the Christian element, and no anarchism exists in Russia. What he does not add, in this connection, but what is well worth adding, is, that many Russians who are devoutly attached to Christianity and their national Church and entirely out of sympathy with Tolstoy (except as a great literary man), are loyal adherents of liberal Russia, even to the apparent inconsistency of remaining still, perforce, attached to the hated bureaucracy. It is encouraging, also, for the friends of Russia and of progress in general to have the opinion of such an expert as Professor Miliukoff to the effect that all the much-condemned diseases are mere ailments of growth (which have always existed), and that not one is incurable, any more than are the evils of rapid growth in the United States, which furnish a sort of parallel in many respects.

Nothing in the volume is of more pertinent interest than the consecutive demonstration of the perfectly natural, inevitable development of the autocracy forced upon the infant, adolescent and full-grown state by geographical conditions and the lack of barriers against attacks from without, which rendered a powerful central organization of the government absolutely necessary. Equally instructive is the picture of the essential difference between the Russian and the American type of character, which, under somewhat parallel natural conditions, has led to radically opposite results in the exploitation of resources and their present condition. "A certain amorphousness, a certain plasticity in Russian manners and character," he regards as the chief feature in the national type; and to that, the sole though negative inheritance from the past, he attributes nearly everything, good or bad, which has ever been asserted about the national character, by both foreign and native observers. "A backbone is missing both in Russian virtues and Russian vices," he says, declaring that to its flexibility, its accessibility to every new impression, are due both the good and the bad traits of the national type, and that Russian history has not furnished enough social education to provide the body of social tradition which works out the formulas that may act as stimulus or coercion. There is a lack of continuity in the social tradition.

In discussing the origin, growth, and various currents of "The Nationalistic Idea," our author makes an illuminating comparison, which is invaluable as a clue to general study of Russia and to the cause of its tardy progress.

"Between Russia and other European countries the contrast was not so great at the moment of their first meeting, some centuries ago, as it is perhaps now between Japan and the Europe of to-day. Therefore the contrast between nationalism and foreign culture could not be fought out in Russia in such a rapid and resolute way, and the victory over old tradition could not be so soon and completely won, as would be the case to-day. Instead of that, there followed a long process of compromise and assimilation, which in Russia is even yet not completed."

When Professor Miliukoff undertakes to consider "The Religious Tradition," he approaches the subject from the hostile (or

at least semi-hostile) point of view frequently adopted by educated Russians, who include the Church in their hearty dislike of existing institutions, and thus sometimes fail to render full justice to that which must, inevitably, in all countries, be understood by a sense other than the purely intellectual. He also fails to bear in mind the parallel conditions and action elsewhere. For example, he refers to the services in the case of illness and so forth as "magic rites and solemn incantations" to expel the evil spirits, which, he says, the village priests perform today exactly as the first bishop of the monastery in Kiev did in the eleventh century. He might have made his comparison stronger (though even less convincing on the "magic" side) by referring to Christ's expulsion of devils as the cause of disease in the New Testament, and to similar services in other Christian churches. He appears to forget, also, that Russia and the Eastern Church are not alone in having adopted and adapted pagan festivals and in their dealings with the ancient pagan gods; and that the Russian Church is no more amorphous in its conception of God and the saints, or no more realistic in its pictorial representations of them, than are other branches of the Christian Church, to which the reader is led to assume (by implication) it is fatally inferior in many of the respects enumerated. It would require more space than is at our command to enter into the matter in the detail which such unfairness—whether voluntary or involuntary—justly demands; but we may characterize the whole presentment of the religious question as resembling the reflection beheld in a skewed mirror. Even the summary of the old attitude toward poverty, the quotations from the writings of an ancient popular theologian, the description of the Church as "a kind of Eternal Life Insurance," could be used with equal justice and effectiveness of any other Christian community; and if the labels were omitted, their origin could not possibly be divined by the keenest experts. Nevertheless, if one is already sufficiently well informed to be able to discriminate, there is much valuable and curious information not readily obtainable elsewhere, to be gleaned from this chapter. For instance, after describing a sect established in the second half of the eighteenth century by "a vagabond dreamer, Euphemius" (Evfimy), including his theory of the land, Professor Miliukoff calls attention to the fact that this fugitive soldier anticipated Count L. N. Tolstoy's doctrine of Christian anarchism by one hundred years.

When he deals with "The Political Tradition" he is on firmer ground, and clearly demonstrates the assertion with which he starts, that the idea cherished by the Russian nationalists, to the effect that autocracy never has changed and is unchangeable, is wholly erroneous. He shows that the theory is of very recent origin; and incidentally he sets forth the facts concerning the successive degradation of the aristocrats and the elevation of the lower classes by which the autocracy was cleverly maintained. This point has not been hitherto presented to the foreign student; if at all, certainly never so lucidly or in so thorough a degree. Arising in necessity for preservation of the State, considered as so impregnable in practice that no legal authority for it was ever sought, or even exists, the autocracy is shown to have become logically impossible as well as unnecessary at the present day. The innumerable lines in which autocracy had come to exercise irresistible authority before it was recently abolished by the Imperial decree, are described, with pertinent instances, judiciously selected, and all the more convincing because they have not been selected (as is too often, obviously, the case with sensational writers on the subject) with an eye solely to exaggerated effect. Incidentally, the whole tangled quarrel about the classical (as opposed to the more modern, scientific) system of education is fully explained.

A chapter on "The Liberal Idea" naturally follows. In it the bureaucracy is traced from its useful and necessary origin to its present position of being generally detested, not only by those outside of it, but by its own progressive members, who would gladly reform it; and the subject is not devoid of lessons for our own parallel bureaucracy, which has developed most of the evils so reprehended by the Russians in their own. In treating of the radical and socialistic ideas which made their appearance, in due time, in Russia, Miliukoff significantly comments: "Russian radicalism fancied Russia able to jump clean over what was thought to be a transient stage, to the highest requirements of the most advanced theory. Without knowing it, in so doing they had chosen the way of bitter disappointment and of sad practical experience." The analysis of the political parties—their infinitely varied and often startling groupings and changes—is invaluable for those who would grasp the genesis and sequence of the parties which are now striving for the control of the dangerous and complicated situation in Russia; and the whole vitally important question of the Zemstvos is stated in a masterly manner beyond the reach of foreign observers. The student of history will be interested to find that the famous and much-discussed "Constitution" of Alexander II., which that Emperor's sudden death halted, was not a constitution in any sense of the word, according to Professor Miliukoff's knowledge. This eliminates (for those who accept this newest version) the interminable discussion of Alexander III.'s and Mr. Pobledonostzeff's action in regard to it.

In "The Socialistic Idea" Miliukoff sums up the subject at the start: "Russian Socialism, then, differs from German Socialism in that it carries to an extreme the features which have made German Socialism differ from English and American"; and he explains (among other things) that, in Russia, democracy was awakened by Socialism, instead of contrariwise, as is usually the case. In referring to the much-lauded *Mir*, or Commune, he shows how this self-governing, vote-owning institution was ruled, in true American fashion, by the few for the benefit of the powerful and wealthy. The possibilities thus suggested for misrule when universal suffrage shall have been acquired are not reassuring. Historical attempts at a constitutional monarchy and the reasons for their failure are briefly set forth, as is the forced inception and gradual development of serfdom, together with the origin of the idea among the peasants which has created and is destined still to create untold mischief, as to the suppression of imperial edicts of wide scope in their favor by the upper classes. One of the most curious points in the book is the statement of the manner in which the peasants received the Socialists who preached communism. Another is the statement: "It is very important to emphasize that 'nihilism,' though peculiar to Russia as a psychological disposition of mind, as a theory is undoubtedly of foreign extraction. In Russia it was only the belated reverberation of a movement which had had its day in both France and Germany." In this connection it is worth while to correct an error of translation which was not noticed by the friends who helped the author with his English (any more than was the characteristically Russian and sometimes misleading use of the different past tenses of verbs), though it will prove puzzling to readers. In elucidating Lavroff's theories, he says: "He even admitted that, so far from destroying the State, it would be necessary to preserve it, even 'the other day of the Revolution.'" For "the other day" read "the day after," and the sense and cogency of the remark become clear.

Of the chapter on "The Crisis and the Urgency of Reform" we can only say that nothing short of a quotation in full could do justice to its incomparable value, regarded either as a historical document, as a guide for the present difficult situation, or as a suggestion for the future, in its complete mastery of every line of the complicated subject, and the calm, reasonable, and judicial treatment of all the correlated branches. In the significant "Conclusion," the most pregnant passage is the following:

> "Increased and united as they are, the forces of opposition are still not strong enough to replace the Government by a violent overthrow. But they are strong enough to make the use of violence continuous, and by increasing this to preclude any further peaceful work of civilization. . . . Public opinion will not now be satisfied with a consultative chamber, and will not join the extremists who want a federative republic and a referendum. The great majority will be glad to have . . . a constitution similar to that which was sanctioned in Bulgaria by the Russian Czar twenty-five years ago, . . . which includes universal suffrage and one chamber. The habitual argument of the Conservatives that Russia is not ready for a constitution is cut short by this example of Bulgaria. The broad democratic basis of the Constitution of that country did not correspond to the degree of political development of the Bulgarian people, but it proved highly valuable as a means of promoting their political education."

The six maps make a valuable addition to the text; and if the unusual system of transliteration for Russian names and occasional words is disturbing to those who understand the language, and positively baffling to those who do not (through its obscuration of names familiar in their ordinary forms), it has at least the merit of representing the pronunciation as well as the accepted methods.

Swinburne. By George Edward Woodberry. (Contemporary Men of Letters Series.) McClure, Phillips & Co. 1905.

Mr. Woodberry's little book about Swinburne is in no sense a biography, or even

a literary portrait. It is, rather, a subtle and subjective study not so much of Swinburne's poetry as of his poetic impulse. Even this poetic impulse is not touched, save in a phrase here and there, chronologically. It is treated as an accomplished spiritual fact, analyzed, displayed, and invested with issues of power and beauty, that, as some may think, proceed rather from the compelling fervor of the interpreter than from the achievement of his author. There are many who would have welcomed a more consecutive account of Swinburne's forty years of poetic labor, and would have been grateful for some suggestions of his personal quality and his *milieu*. There are, however, many insidious dangers that beset the man who makes a book about a contemporary. Mr. Woodberry has probably chosen the safer as well as the more dignified course, and in the long run this study of the inspiration of the first English poet at the beginning of the twentieth century by one of the finest and truest of American poets will have a permanent interest for the discerning few that no gossipy personal record could possess, and that even a bivoluminous "Life" will not totally blot out.

Mr. Woodberry is first impressed by Swinburne as "a figure sole and supereminent, the poet republican"; and he is so at one with the revolutionary republicanism that he even finds pleasure in the poet's most effusive and fevered denunciations. "These," he says, "are curses to rejoice the heart. They mark their victims indelibly for hell." Next he is impressed by Swinburne's poetic scholarship, his citizenship in realms of gold. Of this he writes in one of the best of his paragraphs:

"He is, in fact, in his greater work of the imagination, remote from current life. He lives, withdrawn in his own thoughts, in that sphere of the poetic imagination where there is a true timelessness—the solitude thronged with figures that appear at any moment from any age, and drift across the vision or play their mimic parts before the mind's eye and disappear. It is the world of the great artists. Locrine, Erechtheus, Meleager are natural there, so are the stormy passion of the Scotch peers, the craft of English statesmen, the spectacle of Venetian pride; or Sappho or Faustine. The world of Swinburne is well symbolized by that Zodiac of the burning signs of love that he named in the prelude to 'Tristram of Lyonesse'—the signs of Helen, Hero, Alcyone, Iseult, Rosamond, Dido, Juliet, Cleopatra, Francesca, Thisbe, Angelica, Guenevere; under the heavens of these starry names the poet moves in his place apart, and sees his visions of woe and wrath and weaves his dream of the loves and the fates of men. He is a myth-lover, a dreamer, a companion of the myths and the dreams of the past, an artist of the imagination."

Then, after a brilliant if somewhat over melodious passage on Swinburne's melody, Mr. Woodberry passes in his fifth section, with a slight confusion of structure, to "the second salient trait" of his poet's work, its "rendering of the experience of passion," its paganism, in short. From Swinburne's passion he proceeds to his meditative power, with its impressive dealing with fate. These two, with the treatment of nature, which is the subject of the seventh section, Mr. Woodberry considers the three "great monochords" of Swinburne's verse. Under the last heading he has a paragraph of searching yet sympathetic criticism which is perhaps the most ponderable in the book:

"Fire, air, earth and water are the four elements from which his very vocabulary seems made up; flame, wind and foam, and all the forms of light are so much a part of his color-rhythm that they become an opaline of verse peculiarly his own; his mannerism in diction and style is chiefly a thing of his fascination with these elemental phases of matter and sensation, which are more abstractions of motion, hue and luminousness than simple objects of sight and hearing. The blurring effect of this mass of indefinable sensation, especially when metaphorically employed, even more than the overcharge of vocal sound in the verse, accounts for that impression of vacuity of meaning that Swinburne's poetry in general makes on readers not habituated to his manner."

Finally, after a section upon the human affections as they stir in Swinburne's poetry, Mr. Woodberry concludes his rhapsody of the liberty, melody, passion, fate, nature, love and fame, which are "the seven chords which the poet's hand, from its first almost boyhood touch upon the lyre, has swept now for two-score years with music that has been blown through the world."

Mr. Swinburne will be fortunate if he ever again finds an interpreter so eloquent and sympathetic as Mr. Woodberry. Yet, despite the arresting eloquence, his final high estimate of Swinburne's achievement is but partially convincing. At one point in particular does it seem to us that Mr. Woodberry protests too much. He has a great deal to say of the essentially English quality of Swinburne's Muse. He was, says Mr. Woodberry in the very beginning, "sprung of the strength of English blood," and again: "He is English, bred with an European mind, it is true, like Shelley, like Gray and Milton, but in his own genius, temperament and the path of his flight charged with the strength of England"; and yet again: "The things of strength are in his verse; it is English genius and English strength, racial in lyric power, in free intellect, in speech—none more so—and English also in its poetic scholarly tradition."

Now it is precisely in the "paths of his flight" as well as in his "poetic scholarly tradition" that Swinburne may most reasonably be maintained to be totally un-English. He has loved England and her old poets well, but his true and self-avowed masters in verse have been Hugo and Baudelaire—neither exactly of the British temperament. In his beautifully colored and cadenced wash of words, there is scant trace of the pregnancy, the weight, the sense of reserve power that made the true strength of English poetry. His is the weakness rather than the strength of passion, and it will be one of the greatest critical surprises in the history of literature if, as Mr. Woodberry expects, there shall increase "with every passing generation" the number of those "in whose hearts his poetry is lodged with power."

Ways of Nature. By John Burroughs. Boston: Houghton, Mifflin & Co. 1905.

This book springs from a reaction in the author's opinions of animal intelligence, occasioned by the work of recent nature-writers, who, unwarrantably, he thinks, read the lives of wild creatures in the light of human experience, and impute to birds and beasts human motives and methods. It represents his views after a fresh study of animal life and instinct. In the various essays that make up the book, he turns the subject over and over to get light from different angles, and the gradual development of his opinions appears in the successive essays. Our summary cannot, of course, represent the wealth of illustration which the book contains.

The reaction referred to appears to have carried Mr. Burroughs far when he says that the founding of hospitals for sick or homeless cats and dogs, and the condemnation of all forms of vivisection, and the desire on our part to believe that animals are guided by reason and not by instinct, are sentimentalism. Another passage, however, states his position more happily:

"To attribute human motives and faculties to the animals is to caricature them; but to put us in such relation with them that we feel their kinship, that we see their lives embosomed in the same iron necessity as our own, that we see in their minds a humbler manifestation of the same psychic power and intelligence that culminates and is conscious of itself in man—that, I take it, is the true humanization."

Fear, love, and hunger—the need of safety, offspring, and food—are, Mr. Burroughs maintains, the prime motives of the lower animals. Three factors shape their lives—imitation, experience, and instinct. Imitation is doubtless unconscious, and only secondary things are learned in this way. Experience develops greater cunning, both in the species and in the individual, and teaches what not to do; but of positive knowledge our author believes that it accumulates little if any in the case of individual wild animals. "That old birds build better nests or sing better than young ones it would be hard to prove," he says, "though it seems reasonable that it should be so," and though young birds reared in captivity practise a long time before they sing well. Instinct, or natural prompting, is nine-tenths of the whole matter—inborn instinct acted upon by outward stimulus. The animals inherit, in this, all that they need to know to preserve their existence, the accumulated knowledge which necessity, during the evolution of the species, has taught their progenitors. This instinct, sometimes apparently resourceful and flexible in adapting itself to new conditions, looks like reason; but Mr. Burroughs holds that it is not reason. It is a part of the cosmic intelligence that is operative in the vegetable as well as the animal world, and that rises in man to the height of reasoning intelligence; but the difference between animal intelligence and human reason, though one has been evolved from the other, is a difference, not of degree, but of kind, as, by analogy, light or electricity differs in kind from the heat that was its source.

"Animal life parallels human life at many points, but it is in another plane. Something guides the lower animals, but it is not thought; something restrains them, but it is not judgment; they are provident without prudence; they are active without industry; they are skilful without practice; they are wise without knowledge; they are rational without reason; they are deceptive without guile. . . . When they are joyful, they sing or they play; when they are distressed, they moan or they cry; . . . and yet I do not suppose they experience the emotion of joy or sorrow, or anger or love, as we do, because these feelings in them do not involve

reflection, memory, and what we call the higher nature, as with us."

Wild animals have, we are told, the faculties of perception, sense memory, and association of memories, and little else. Their instinct is intelligence directed outward, never inward, as in man. They share with man the emotions of his animal nature, but not of his moral or æsthetic nature; they know no altruism, no moral code. Mr. Burroughs maintains that we have no proof that animals in a state of nature can reflect, form abstract ideas, associate cause and effect. Animals, for instance, that store up food for the winter simply follow a provident instinct, but do not take thought for the future, any more than does the tree that forms new buds for the coming season. The captive animal chafing in its cage suffers merely physical discomfort, and is reacting instinctively against the barriers, not picturing to itself the joys of freedom. The nature of the animals prompts them to their acts, and we think of them as the result of a mental process, because similar acts in ourselves are the results of such a process. Remarkable incidents of what looks like reason, reported of wild animals by some writers, are here discredited on the ground that they contradict general observation and are probably the result of inaccurate or prejudiced seeing. Well-authenticated instances reported of domestic animals are explained as the result of association with man. Domestication, Mr. Burroughs thinks, demoralizes instinct. Apes and elephants show something akin to reasoning intelligence, and "the dog is almost a human product."

Mr. Burroughs takes issue sharply with the popular belief that animal parents consciously aim at instruction of their young. Nature provides, he says, merely that the unconscious example of the parents shall stimulate imitation in the young. The parents have no store of ideas to communicate, no knowledge in the strict sense of the word, no solicitude about the future. They have only emotions—fear, suspicion, etc.—to communicate, and all communications must refer to the moment, and be made in presence of the thing that arouses emotion. It is the instinctive play of animals that is mistaken for an attempt to teach the young. The parents sometimes take part, but do not direct; all is spontaneous and haphazard, but, by nature's provision, is always along the line of the animal's future struggle for life. Kittens play with a ball or stick as if it were a mouse; dogs race and wrestle as in the chase; birds circle and dodge as if escaping a hawk. The playground, then, is the only school of the woods, and, so far as the animals know, what goes on there is merely for pleasure.

Neither will Mr. Burroughs accept the popular idea that animals of the same species vary markedly in individuality. Animals have not, he says, the complex needs, relations, and aspirations that in man give rise to great diversity of character and capacity; therefore he is skeptical about the individual types and exceptional endowments often claimed for them. "If he [the animal-story writer] proceed upon the thought that the wild creatures have as pronounced individuality as men have, that there are master minds among them, inventors and discoverers of new ways, born captains and heroes, he will surely 'o'erstep the modesty of nature.'" Domestic animals, he admits, show some individuality; solitary wasps, a good deal. He suggests that the latter are differentiated by solitude, as men are, and that among the larger wild animals the solitary may display more individuality than the gregarious. Of this, however, he finds no proof. It appears to the reader, indeed, as if the inevitable lack of wide and intimate knowledge of the individual life of most wild creatures must seriously hamper the discussion of at least this part of the subject.

Sidney Lanier. By Edwin Mims. Boston: Houghton, Mifflin & Co. Pp. vii, 386. 1905.

The chief tests of a biography are accuracy and charm. The former this book seems to fulfil; we have not found any misstatement nor noted any omissions. Charm the book does not possess. It is pleasantly written, and will be a stimulating reminder to those who knew and loved the man as well as know and love his work. A reader coming to this book in entire ignorance of Lanier must admire the individual and might be led to read his poems, but the book scarcely compels to either, and by no means ensures a complete perusal of itself except to one already interested in its subject. Its chief fault is that it casts no enchantment over us to lure us on whether we will or no.

Specific instances of discretion and good taste are many, and examples of the reverse are few, yet it would have been far better to omit the excerpt (pp. 305-307) from Mme. Blanc's article in the *Revue des Deux Mondes.* Perhaps some revelation of the flagrancy of the extreme Lanier cult would be felt needful by any one writing his life; but, on the one hand, the facts recorded in these passages must pain those who admire his writings without overvaluing them, and who love the character of the man himself without deifying him, while they must repel those whom a life of Lanier should allure to read his better works and to gain inspiration from what they can learn of his rare individuality. On the other hand, Mr. Mims misses the subtle Gallic flavor in what he quotes.

The rehearsal of laudations, even of the greatest authors, is likely to irritate those not already under their spell, while the pointing out of defects in the work or character of one admired as a creative genius, and revered as a man, is far more likely to arouse interest in those who are strangers to his compositions and personality. Intentionally or otherwise, this last is what Mr. Mims has done. The steady glow of his general admiration is made all the more telling by his repeated noting of Lanier's shortcomings, as on pages 2, 238, 248, 345, 346, 364-367. On page 364 he says: "He never attained, except in a few poems, that union of sound and sense which is characteristic of the best poetry." This repeated caution of statement or positive understatement of praise gives an air of fair-minded judgment to the book as a whole which makes its laudatory portions far more convincing than if they were not relieved by contrast; and such a sweeping reservation as that just quoted lends weight to the exposition of the biographer's belief in Lanier's capacities in the line of fertility and artistic finish. Mr. Mims (p. 126) attempts to gloze Lanier's characterization of the college he attended as "farcical," but he has the courage to print several healthy utterances of unwelcome truths. Delightful is what he quotes on page 290 from a letter of 1873 about a bad novel:

"And so far from endeavoring to serve the South by blindly plastering it with absurd praises, I think all true patriots ought to unite in redeeming the land from the imputation that such books are regarded as casting honor upon the section. God forbid that we should really be brought so low as that we must perforce brag of such works; and God be merciful to that man (he is an Atlanta editor) who boasted that sixteen thousand of these books had been sold in the South. This last damning fact ought to have been concealed at the risk of life, limb, and fortune."

Altogether this book tells Lanier's life in a straightforward, if not brilliant, manner, and honestly attempts to characterize him as a man, a musician, a scholar, a poet, and a critic. Much space is given to his critical utterances and to valuation of them. Particularly good (p. 351) is what Lanier said of his own critics: "Nothing has amazed me more than the timid solicitudes with which they rarefy in one line any enthusiasm they may have condensed in another, . . . forever conciliating the yet unrisen ghosts of possible mistakes." Considered as a critic, he is attractively presented, again by general commendation with emphasis upon defects which, like the faults in his poetic make-up, add to rather than detract from one's conviction of his inherent capacities, for they are essentially the defects of genius.

This biography offers no explanation of the fact that while Lanier's utterances, views and creations roused widespread interest and elicited varied response, they have nevertheless failed to win at home or abroad general acceptance of his admirers' claims. Again, and chiefly, this book acknowledges but totally fails to solve the main problem before a writer on Lanier. He thought himself a great poet, and hoped for a span of life wherein he might win all the world's adherence to his belief. A great proportion of those who knew him conceded the reasonableness of his faith, and many to-day feel that, had he been in vigorous bodily health at the date of his death, had he survived, were he alive to-day, he would have become a dominant figure in American literature and a noble presence among the great English poets. And yet no recollection of his poverty, of his ill health, anxiety, and forced haste can explain entirely such a pitiful array of quotations as even Mr. Mims's ardor has to put up with, on pages 369-375, as the best that can be culled from all his poetry. A foreigner glancing at these gleanings would dismiss Lanier from his mind as absurdly overrated and wholly negligible. A definitive biography, if it maintains the negative, must explain whence came the general impression of Lanier's greatness; if it maintains the positive, must succeed in conveying to its readers some adumbration of the poet's thrilling effect on his acquaintance. Mr. Mims leaves the riddle as he found it.

As good an index as this has, we crave in every biography.

Radio-Activity. By E. Rutherford. Second edition. Cambridge (Eng.): University Press; New York: Macmillan. 1905. 8vo, pp. 580.

A throng of public sensations due to advances in natural science crowd upon a sexagenarian's recollection (Stewart's syrup was the greatest personal sensation of his infancy), *e. g.*, vulcanized rubber; daguerreotypes; the telegraph; Dr. William T. G. Morton's demonstration of the anæsthetic property of ether (and the ether wonder was not a week old when news came of the discovery of the planet Neptune), the same memorable year bringing straw paper, guncotton, and the sewing-machine; the stereoscope; then, the doctrine of the conservation of energy, long debated, though at first pooh-poohed by scientific magnates; the mechanical theory of heat; the Ruhmkhorff coil; Foucault's pendulum experiment; Bessemer iron; aniline dye-stuffs; the Atlantic cable; wood pulp; Pasteur's refutation of spontaneous generation as an ordinary event; spectroscopic analysis with rubidium and cæsium; the theory of natural selection; Deville's aluminium; the extensive use of nitroglycerine; Andrews's discovery of the critical temperature; the wonderful Holtz machine of 1865 (the simultaneous and equivalent Töpler machine somehow being less noised abroad), and, three years later, the Gramme dynamo; in 1869 Mendeléeff's periodic law; then a long calm, hardly broken by such successes as that made by the ammonia soda process, or such half successes as Loomis's wireless telegraphy, which, however, came into wider notice in 1877, when the telephone and phonograph had turned public attention into that channel; the first confirmation of Mendeléeff's law in the discovery of the metal gallium, duly melting, according to prediction, in the warmth of a man's palm; the azo-dyes; Pasteur's germ-theory, followed by Koch's detection of the tubercle-bacillus, and, later, by the enzyme theory; osmotic pressure; the incandescent light; stereochemistry; Weismannism; Cowles's aluminium; smokeless powder; kodaks; the new physical chemistry guided by Willard Gibbs's phase rule, and leading to liquid air and hydrogen; the successful linotype (though that can hardly be reckoned as a scientific sensation); Hall's aluminium; the electric furnace and acetylene; argon; the Röntgen rays; the flutter about Herzian waves; the contact process for the manufacture of sulphuric acids and anhydride; and, latest, radio-activity and radium. Of all these the last promises to mark the deepest revolution of scientific conceptions, by reducing matter from the rank of primordial substance to that of a special state of electricity. After that, we shall be prepared for anything, even for experimental demonstration of the tychist's doctrine that electricity is a psychical phenomenon.

To any person who wishes to be thoroughly informed concerning radio-activity, the above-cited complete digest of all that is known about it, worked out as it is to the utmost secure conclusions of a general kind, is entirely indispensable. It is, to be sure, only the second edition of a work of which the first edition seemed as perfect as possible, and follows that first edition by but fifteen months. Nevertheless, it is largely rewritten; and it would deserve notice if there were nothing more remarkable about it than that, though the preface is dated the 9th of last May, the contributions to its science made in April are so fully discussed that it is manifest that a considerable part of the rewriting of the first edition must itself have been again rewritten while the new edtion was going through the press. The fact that the second editlon is almost a new work, although the first edition was everywhere hailed as most remarkable, simply evidences the wonderful advance of the science in which Professor Rutherford is himself so large and active a factor. The methods he pursues are wholly novel, though they rest on familiar and indubitable principles, and his conclusions are not open to intelligent doubt. Accordingly, we are to know that all elements whose atomic weights exceed that of bismuth, 208, are endothermic compounds, which are undergoing spontaneous dissociation accompanied with a liberation of heat energy millions of times as much as that which could be due to the combustion of as much matter. This decomposition seems to consist in the separation of helium, whose atomic weight is 4, leaving an element whose atomic weight is only 4 less than that of the element first taken. However, as to the products of the disaggregation, it is not likely that any one rule will cover all cases. We simply mention what seems to be the prevalent type.

Radium is a metal, extremely like barium, except that its atomic weight is about the sum of those of barium and of strontium, and except that the average life of an atom of radium is only about two thousand years. It casts off helium, and what is left is a chemically inert gas, somewhat like xenon. The average life of the atom of radium emanation is only five days. It decomposes, and its principal constituent, called Radium A, is left as a deposit on the surface of the vessel. The average life of the atom of Radium A is only four and a third minutes. It is converted by throwing off helium or something like that into a somewhat more volatile element called Radium B, of which the average life is half an hour. Radium B is decomposed in a different way, little studied as yet, into another, less volatile element, Radium C, whose atom has an average life of 40 or 41 minutes. This gives off, not merely such rays as radium itself emits, but, besides others, great penetration, and there is left another element, a little more volatile, called Radium D. The average life of the atom of Radium D is over half a century, and in its decomposition no rays at all are given off, and the very non-volatile element, Radium E, remains. This has an average life of nearly nine days, and, in decomposing, gives off only the more penetrating rays, none of those by which radium affects the photographic film, and is converted into the first of the new elements discovered by Mme. Curie, polonium, which has an average life of ten months. But we will not pursue these vicissitudes further. Polonium is an element very much like bismuth. Dr. Bollwood holds that all these changes come to an end with the production of lead, but we cannot understand that in an absolute sense; and it is not particularly unlikely that lead should be converted into gold. In fact, the tales of the philosopher's stone and of projection do not seem to-day half so marvellous as what we may see at any moment by looking into a spintharoscope.

The index, though it is not quite as full as we could wish, fills twenty-two pages of double columns.

Australian Life in Town and Country. By E. C. Buley. G. P. Putnam's Sons. 1905. Pp. x., 288. Illustrations.

We are not sure whether Australians will feel complimented by being included with Japanese, Chinese, and others in a series of books on "Our Asiatic Neighbors." We have not, however, often read a volume in which solid information was conveyed in a more pleasing style. The illustrations, while having little apparent direct relation to the text, are well chosen. Hannan Street, Kalgoorlie, in 1895 and again in 1905, is especially interesting. Land and climate, country and town life, politics, education, literature and art are all treated.

The last chapter is on "Australia's Destiny." We here find a widely different Australia from that of which we were accustomed to read, and of which some of us had practical experience half a century ago. Deep-shaft and scientific mining have taken the place of the tin dish and cradle. Sheep are shorn by machinery. Bush hands seek work on bicycles. Stately mansions, in which are to be found grand pianos and the newest books, have taken the place of the slab huts formerly occupied even by rich squatters. Foxes, introduced to kill off rabbits, have themselves become pests. Camels are in certain districts used as beasts of burden—we are informed that the native-bred is a much finer animal than his Western prototype. Ox teams no longer cumber the streets of Melbourne and Sydney. Australians live in a soberer atmosphere than in the old "Cheer, boys, cheer!" days. Casual visitors—how much more "old hands"!—must feel drawn by the beckoning mystery of the pathless and still but imperfectly explored country stretching inland—the "never, never land" here so graphically described. As the clack of a windlass and the smell of tar may tend to call many an old sailor against his better judgment again to tempt the deep, so may the pages of this book rouse the desire in some old Australians again to shoulder their "swags" and take to "the wallaby track."

Whatever changes irrigation and artesian wells may bring about, Australia, with its vast proportion of desert and its uncertain seasons, can never become a United States. One would gather that the mental outlook is narrow. Sport, music, and, in a certain degree, evangelicism, have become disproportionately large interests in life. Australia does not enjoy the advantage of having been primarily colonized by men in search of religious and political freedom. One of the most interesting chapters in Mr. Buley's book is on State Socialism. In the bush, with the State for landlord, remittances of rent are through political influence obtained in bad seasons. The State owns the railways and is often compelled to advance money for roads and bridges. The State trains teachers and manages the schools. Help and supervision in the establishment of new industries is constantly demanded. After bad seasons the State sometimes provides seed, and even advances money to tide farmers over till next harvest. The State regulates the hours of labor, fixes wages, and decides industrial disputes. All this

cannot tend to strength and individuality of character, and neccssitates the existence of a large official class. Public debts are out of all proportion to population, urban to country population. The new Federal Government has a difficult task before it. Protection between the different States was logically forwarded by the creation of differing railroad gauges, insuring the transfer of merchandise at frontiers. Unification of gauge will throw an additional heavy burden on the now united Commonwealth. Jealousy between the States has so far prevented the foundation of a central capital.

Turning to revenue matters, we find it difficult to believe that Sydney holds second place in the Britisb Empire as to the value of property rated for taxation. It is interesting to learn that the *Bulletin*, described as the ablest and most widely read journal in Australia, "frankly advocates the independence of Australia under a republican form of government." We are told that a vigorous national life is more and more asserting itself, under which the cry of "Australians for Australia" is being substituted for "Australia for Australians." Our author does not conceal tbe darker shades in his generally sunny picture of Australia and Australian life.

Napoleon's Notes on English History, Made on the Eve of the French Revolution. By Henry Foljambe Hall. London: J. M. Dent & Co. 1905.

The valuable part of this book is that in which appears a translation of the notes on English history taken by Napoleon in the year 1788, when he was much occupied with historical and philosophical reading. The notes are for the most part extremely concise, and give only occasional and not very illuminating glimpses of the personality of their autbor. They were discovered some twenty or more years ago hy Masson; they appeared shortly afterwards in the Paris *Gaulois*, and were later reprinted by Masson and Biagi in their well-known book 'Napoléon Inconnu.' They are now offered to the Englisb-speaking public, translated by the late Mr. H. F. Hall, illustrated, as he informs us, from contemporary historians and refreshed from the findings of later research. The refreshments set forth by Mr. Hall were hardly necessary, but, as they form the major part of the hook, and as in his introduction he appears to attach far more importance to them than to his author, they cannot be passed over without a word of commcnt.

Perhaps the most characteristic thing about this curious book is that, next to Napoleon's notes, the best tbing in it is an excellent frontispiece portrait of Rapin de Thoyras, a French historian of the seventeenth century, who has, in Gilbert's immortal words, "nothing to do with the case." Tbere is not a scrap of evidence, so far as this reviewer is aware, to show that Napoleon ever read a word of his; but Mr. Hall has, which is undoubtedly a distinction nowadays, and hence the frontispiece. Mr. Hall has a queer outlook on historical scholarship that produces most curious results. Sir Walter Scott is apparently his greatest admiration among the general historians of Napoleon, and Dr. Emil Reich, the inventor, as he believes, of psychological history (but, alas, what will Lamprecht say?), is his philosophic guide. It is doubtless the combination of Scott and Relch that leads him to statements of this sort: "One must never forget that Napoleon owed his grit, mental and physical, to the salt savor of the sea. . . . All that is best in Corsican, Frenchman, or Englishman comes from their ancestors, the Sea-rovers." Comment is needless. A few more examples may be given. The great question involved in the ceremony of coronation by the Pope from Charlemagne down to Napoleon is dismissed as one which Napoleon settled by crowning himself, "knowing the dangers of pampering a Pontiff." Mr. Hall, needless to say, is a devotee of the epilepsy theory, for the popularity of which we have to thank Lombroso, Nordau, Nisbet, and Nietzsche; when it comes to specifying in what particular the alleged epilepsy affected the course of history, we are, also of course, not enlightened. But to continue further is unnecessary. The value of the book is not in the editor's work, but entirely in the translation.

The Nation.

NEW YORK, THURSDAY, JANUARY 25, 1906.

The Week.

The tone of the official announcement at Washington of the impending changes in the Philippine Government is most unhappy. All the talk is of salaries. Gov. Wright is making a "pecuniary sacrifice" of such and such amouuts in going to Japan. Mr. Ide, who is to be allowed to succeed as Governor-General for six months, will be $5,000 in pocket by the change. Then he will retire and Gen. Smith will be given a chance at the fat salary. All this is to fall into the worst style of the former Spanish domination of the islands. The idea prevailed that a Governor-General was sent from Madrid to Manila to make his fortune. Stories of the good pickings of Gen. Weyler and Gen. Blanco passed from mouth to mouth. The good of the service, the welfare of the Filipinos, always had to take second or third place in the discussions, the prime consideration being what general had political influence enough to get the job. It is lamentable that an American Administration should drop, even unwittingly, into this vicious Spanish way of envying the high salaries which we compel the Filipinos to pay for the privilege of being governed against their will. But it is in keeping, we fear, with the general letting down from our first enthusiastic pledges to administer the Philippines in a spirit of the most lofty disinterestedness.

In the new personnel of the Philippine Government, too, we note the same change. We began with assurances from President McKinley, echoed by President Roosevelt, that our noblest and most capable should be sent to govern the Philippines. But how we are falling off the pedestal on which we were admiring ourselves! From Schurman and Taft we dropped to Wright, and now we are to sink to Smith. Of the latter's appointment, the best that can be said is that it is absolutely routine and commonplace. He is almost completely unknown; his name means nothing; his abilities, so far as demonstrated, are wholly of the humdrum order. If Gov. Wright is fit to be made Ambassador to Japan, Gen. Smith would appear to be just about qualified to be consul at Kobé. His selection falls in well with the growing and general indifference of Americans to that great colonial problem which, six years ago, they were going to solve to the admiration of the world. They now wish only to wash their hands of the Philippines; yet when Congressman McCall proposes that we wash our consciences too of them by promising independence, the cry is that such a step would be unpatriotic. Public neglect with private exploiting is the new definition of patriotic duty to the Philippines.

The second opening of bids for the Philippine railways leaves about half the projected lines unprovided for in any way, while there is no competition anywhere on a mile of route. This can hardly be called an encouraging beginning. If Congress had simply passed a general railroad law like those of American States, and allowed private capital to build where a prospective profit could be discerned, it is probable that the 200 miles of railroad in Luzon which Speyer & Co. are willing to build without guarantee, would have been constructed just the same. And for all the thirty-year guarantee, we have not yet secured a promise of the system which the Philippine Commission thought necessary for the economic development of the islands. It seems to be taken for granted that the Government will accept such bids as are made, and try to supply the missing links later on. But the outcome of the long negotiations is very different from the expectations confidently expressed when the improvement act was before Congress.

Congress is to abolish the eight-hour day on Government work at Panama. Thus does one of our boasted privileges after another fall before the exigencies of what Mr. Roosevelt calls "the giant canal." First came the waiving of the Dingley tariff on canal supplies. The awful peril of cheapening the canal did not deter the Administration. Haughty Americans were left to pay two prices on what they consume, in consequence of the tariff, and so they were safe and content, let the Isthmus be flooded as it might with goods at bargain rates. From Chinese labor, of course, our sacred soil has to be protected, but Chief Engineer Stevens now tells the Senate Committee that we can't dig the canal without Chinamen. So we suppose they will soon be coming in as the eight-hour law goes out. All this looks to us like a fatal concession to efficiency and economy. The next thing we know, people will be demanding that in this country, too, they be allowed to buy at anti-monopoly prices and work as long as they wish to; and then what would become of the tariff and labor-union legislation?

Secretary Root may not have been diplomatic, but he was deadly accurate, in his talk to the House Appropriations Committee about the defects of our consular system. The reason it is not better is that Congress does not want it to be better. It is Congress that maintains the vicious practice of keeping a consular position as a shelf for a disabled politician, if not as a snug berth for an ignorant but efficient political worker. Mr. Root pointed out that a bill to remedy these evils had been introduced in the Senate, but that nearly all the reforming energy had been taken out of it by the committee which reported it. Whether, even in that mangled condition, it would be made a law, the Secretary said no man could tell. The plain truth is that both Senate and House prefer to go on treating the consulates as party spoils, instead of making them a means of worthily representing this country abroad and giving proper aid to American commerce. Mr. Root stated but the fact. Broken down statesmen who have to be "taken care of," managers of State machines who have to be rewarded—these are the sort of men whom Congressmen delight to foist upon the service. A boss like Hanna goes to McKinley and compels him—it didn't require much compelling—to send a man like Gowdy to Paris, where he was a kind of roaring joke all through his term. In the same way, Quay forced Roosevelt to name his discredited henchman, Saylor. So long as these things go on, it is nonsense for Senators to profess anxiety about improving the consular service, and whine about their desire to meet the needs and wishes of our merchants.

Mr. Root's observations on the Algeciras conference, made before a House committee, are a curious mixture of frankness and casuistry. His assurances that our delegates are there solely in a commercial capacity is eminently satisfactory, and puts an end to absurd speculations as to America's holding a casting vote for or against Germany. Mr. Root's characterization of the purpose of the conference as "ostensibly commercial" was less happy. Certainly, the Moroccan delegate who recently made an eloquent appeal for the preservation of the Sultanate, must have suspected that the deliberations might take a disastrously political turn. On the point of the strained relations between France and Germany, Mr. Root spoke with the appalling frankness that occasionally overmasters his habitual caution. To say in set terms that there was nothing worth the trip to Algeciras except the dissension between France and Germany, is to cast aside the usual reserves of diplomacy. The indiscretion was the more pardonable because it was made before a small body, and because it

gives an almost excessive emphasis to the fact that the American delegates may treat Algeciras as an agreeable winter resort, and free their minds from undue preoccupation with the sessions in the *Ayuntamiento*. Such assurances are not superfluous when light-headed humanitarians are petitioning the President to step in and quickly settle the Eastern question.

It is evident that the legal lights of the Senate are preparing for a great debate on the railway-rates bill. Messrs. Bailey, Knox, Foraker, and Spooner are plainly stuffed with arguments and precedents, so much so that matter oozes from them on the slightest provocation. Senator Fulton of Oregon attempted to make a speech the other day, but first Bailey asked a question, and then Foraker and Knox and Spooner rushed to the fray, until the Senator supposed to have the floor was forgotten, and all the interest centred in the animated colloquy between the best lawyers of the Senate. All of them being perfect masters of the law, they naturally differed violently as to what the law really is; but on one or two points there was agreement. The courts can pass only upon a definite, concrete case of railroad rate-making, where there are individual parties to the judgment; they cannot pronounce judgment on abstract principles or lay down general freight classifications. Furthermore, Congress cannot delegate the legislative power to a commission; nor can a mere commission decide finally whether a given rate is "reasonable" or not, since that is a judicial function. These points are vital to the legislation which the President desires, and are apparently fatal to certain forms of it which he has favored.

This year's Statehood bill is essentially the same as the one which went through Congress two years ago. Then it was the occasion of no excitement at all, until it got to the Senate, while this year it has seemingly brought advocates and opponents almost to the shooting point. The charges of corrupt influences opposing the two-State bill have aroused militant indignation on the other side, and the heavy artillery of the anti-joint-Statehood party of Arizona is being hurried to Washington. On Thursday the chairman of the Committee on Territories was taunted by a minority member with having changed front on the whole question. This he denied with warmth, but it may be noted that, even if Mr. Hamilton had altered his position as regards the Southwestern Territories, he only followed the same course as did the House as a whole, which voted for joint Statehood last year, although several times willing in the past to admit Arizona and New Mexico separately.

The dismissal of three Annapolis midshipmen last week is the first real fruit of the hazing investigation, and proves again how serious the situation at the Naval Academy has become. Most of the witnesses either appear to be afraid to testify truthfully or are sullenly contumacious. When one midshipman told the truth frankly the other day, the court-martial was moved to compliment him. Things were very different at West Point during the hazing investigation of 1901. Then the cadets felt themselves insulted because the prosecutor insinuated that they were not telling the truth. In other ways also the spirit and discipline are far better at the Military Academy than at Annapolis. At the former the cadets do not hesitate to report even their room-mates for infractions of discipline; at Annapolis, favoritism or spite seems to have controlled reports. At the beginning of the West Point investigation there was some attempt to defy the authorities, but that was speedily ended. As even the service papers have admitted, the naval cadets apparently feel that they can do as they please, irrespective of their superintendent, the Navy Department, or Congress. At present it looks as if nearly all the midshipmen of the first and second classes would have to be tried, with many dismissals as a result. Therefore, some timid souls at the Navy Department are urging that the whole inquiry be dropped and the cadets sent to sea at once, "because of the navy's great need of officers." The navy may in truth be short-handed, but, no matter what its straits, it ought not to want young men schooled in the system of lying, deceit, brutality, and unmanly abuse of authority which has formed the Annapolis code.

David B. Hill asks the public to pass upon all his relations with the Equitable. This is the significance of his request that the State Bar Association investigate the whole matter. He realizes the delicacy of his position. Senator Chauncey M. Depew's annual retainer of $20,000 was pay for political and social rather than strictly legal services—unless lobbying is covered by the broad word "legal expenses." When people learned that so influential a Democrat as Hill, once the boss of his party in this State, was also retained, they naturally suspected that the two cases were parallel. Mr. Hill roundly asserts: "I honestly and fairly earned every dollar which was paid to me. I never received from the Equitable Society any moneys whatsoever for any political services or for any political purposes." In these words Mr. Hill raises rather a nice question in ethics. The Equitable was not unwilling to secure Mr. Hill's good will and influence, and indeed may, like the rest of the world, have doubted whether it was possible to retain Hill the lawyer without retaining Hill the politician. Mr. Hill himself was troubled by no misgivings. "I have never," he says, "mingled business with politics or politics with business." That is all very well for a man of Mr. Hill's robust integrity and squeamish conscience; but ordinary mortals cannot draw the line so sharply. We do not go so far as to say that a prominent politician should not accept a retainer from a corporation which is asking for political favors; but the least that he can do is to follow Mr. Hill's fine example in keeping the lawyer and the politician in separate and watertight compartments of his mind and soul.

Once more the West has shown the East how to do things. The representatives of the "Big Nine" colleges of the West—Chicago, Michigan, Minnesota, Wisconsin, Northwestern, Iowa, Indiana, Illinois, and Purdue—on Saturday abolished the present game of football, and decided to await from the new football committee such playing rules "as will free the game from brutality and unnecessary danger." If such alterations are not sufficiently sweeping, the "Big Nine" will appoint its own committee to draw up rules. But the good work did not stop there. These colleges barred out all graduate players, no matter from what college; urged that freshmen be also ruled out, thus restricting players to three years on a team; limited entrance fees to games to fifty cents; abolished training tables, and fixed the number of intercollegiate games to be played by each team at five in a season. Obviously, while the East has been discussing what it ought to do, the West has been making up its mind. More drastic reforms, next to the abolition of all intercollegiate athletics, could hardly be asked, particularly as there is to be no training before the colleges open, and no professional paid coaches are to be employed hereafter. This ruling, if adopted in the East, would bar out Mr. Reid of Harvard and Mr. Camp of Yale.

Mr. Walter Camp's admission last week that the Yale athletic surplus, which he had carefully concealed during his twelve years of athletic dictatorship at New Haven, amounts to no less than $96,325, and will reach $130,000 by the end of this college year, was fairly sensational. Yale men who have not been wholly carried away by the athletic mania must be equally pained by other revelations made by Mr. Camp to Mr. Clarence Deming. From these it appears that Mr. Camp's own pay and that of the athletic trainer, Murphy, have invariably been hidden by being charged to the "maintenance of the field," while

the rowing coach's salary was tucked away under "maintenance of boathouse." Even more enlightening is the confession that Murphy and the Yale football captain, Hogan—the latter a paid agent of the Tobacco Trust—were last year given a trip to Cuba because of Murphy's health; Hogan acting, we presume, as nurse and companion. Just how much money has been paid out for the tutoring of athletes deficient in their studies Mr. Camp does not say; the practice he admits. All this simply rounds out the facts as to Yale athletic evils printed in *McClure's Magazine* last spring. President Hadley, in a recent speech, admitted that there must be reforms in the methods of handling athletic receipts and disbursements. The very first reform undertaken at New Haven should be the removal of Mr. Camp from control of Yale athletics. His financiering abilities demand a wider field.

Mr. Marshall Field did not have to wait for death to extinguish envy. For many years he had enjoyed the esteem of all sorts and conditions of men. In Chicago, and indeed throughout the great Northwest where his name and fame stood for so much, his repute was high and his popularity marked. Though one of the richest men of his time, he was never held up as an embodiment of greed; his name was never the signal for hisses or opprobrious cries even in a meeting of Socialists. In a day when so many men of great wealth are made the object of suspicion, dislike, hatred, wrath, and malice, Mr. Field's immunity is well worth inquiring into. Doubtless his personal bearing and manners counted for something. The deeper reason lay behind. Mr. Field had accumulated his immense fortune by methods which the considerate judgment of his fellows pronounced legitimate. It was a regular and honorable business, long pursued, that brought him wealth. No unscrupulous stock manipulation, no ruin-spreading monopoly, could be pointed to as the source of his great riches. Hundreds of other men had only to apply a moderate business ability to the natural advantages of Chicago's position in order to become rich; and Mr. Field, applying supereminent ability, became richer than any of them. But all felt that his rewards were lawful. In public spirit and benevolence Mr. Field was not deficient, though he could not be called extraordinary in either. He gave perhaps as much as could be expected of his time to the civic interests of Chicago. His voice and influence were at any rate on the side of good government and every municipal advance.

A John Hay Library for Brown University is a singularly appropriate memorial to the dead statesman. In offering $150,000 toward a fund of $300,000 for this purpose, and in suggesting the name of the building, Andrew Carnegie has shown a fine appreciation, not only of the services which his friend, the late Mr. Hay, rendered to the cause of international peace, but of the fitness of the recipient of the magnificent gift. By the very terms of the Brown charter, the Quakers always have had a representation of five members on the board of trustees. It would perhaps be hard to trace a direct connection between this important element in the control of the college and the names, in its roll of distinguished graduates, of men who love peace. Yet the Quakers have exerted a powerful influence upon the community in which Brown is situated. Moreover, Henry Wheaton, sometimes called the father of modern international law, was a graduate of Brown in the class of 1802. Every one who is familiar with the history of diplomacy knows how much Wheaton did to promote good-will among nations, not only by his writings, which are still quoted as authority, but by his various negotiations as foreign minister and plenipotentiary. The career of Wheaton has been one of the glories of Brown. From time to time other alumni, remembering his labors, have contributed to Brown's steadily growing collection of works on international law, until the University now possesses a library of extraordinary value on this subject—a library which may well occupy a place of honor in the new building.

That Birmingham should have stood by Chamberlain is no great wonder. For years he has controlled the local machine of his own creation, whether for Liberal or Unionist purposes. Furthermore, his personal popularity is such that, under any flag whatever, affectionate Brummagem would obey the command, "Vote for Joe." But the clean sweep at Birmingham sharply emphasizes Mr. Balfour's defeat at Manchester, and leaves Mr. Chamberlain the actual if not the titular leader of his Majesty's Opposition. Plainly, no recovery from tho *débâcle* is possible under Mr. Balfour's discredited leadership. It has become a question of Chamberlain or a newcomer—of a lurch to protectionism or a reorganization along traditional Tory lines. Evidently, Mr. Chamberlain's local success proves little as to the general acceptance of his doctrines, and it would be strange if the Conservatives should rally as a body to one who has split the party and brought it so near to political bankruptcy. Mr. Chamberlain retains, however, the prestige due to one who has fought on a straight, if unpopular, issue, and the influence natural in a skilful manipulator of the party machine.

M. Clément-Armand Fallières, who has just been promoted from the presidency of the French Senate to that of the Republic, has a long and consistent record as a Moderate Republican. He served Jules Ferry in various Cabinet positions; President Carnot asked him, though without result, to form a Cabinet. In the early 90's, as Freycinet's Minister of Justice, he took a strong anti-clerical stand, and advocated the abortive measure of 1892 for the repression of the religious orders. Th se activities constitute his real bond with the very mild radicalism of Prime Minister Rouvier. The new President is eminently a safe man, his gifts being those of the barrister and jurist, and he will probably accept very gracefully the subordinate and highly ornamental rôle of first citizen of France. More significant than his election is the small comfort given to candidacies of such a notable sort as those of the expansionist Doumer and the great Socialist Parliamentarian Sarrien. Even the firm stand in favor of all the moral platitudes recently taken by Doumer, in 'The Book of My Sons,' could not allay the suspicion that the reorganizer of Tonquin had Napoleonic ambitions; whereas Sarrien is too potent a personality to be trusted with the routine amiabilities of the Presidential office. The election of a President excites singularly little interest in France. The berth, to a really ambitious politician, bears an ominous resemblance to a shelf. So far as it goes, however, the election of M. Fallières indicates a further reaction from the extreme Radicalism of Combes towards the opportunism of Méline and Waldeck-Rousseau.

The successful and orderly Social-Democratic demonstrations of Sunday against the unfair terms of the Prussian suffrage reflect credit upon the party and its leaders. Undoubtedly, some people will attribute the absence of disturbances to the extraordinary military precautions taken in Berlin and elsewhere, but this would be unfair to the Social-Democrats. From the moment the meetings were planned, Bebel and his associates insisted that they must be pacific in tone and character. Had there been bloodshed, it would undoubtedly have militated against the Government, precisely as did the St. Petersburg "Red Sunday" killing. On the other hand, the Government would have seized upon any disorder to denounce the Socialists as anarchists and revolutionists. As it is, this popular demonstration is the most notable one Berlin has seen since the days of 1848. No less than ninety-three meetings in that city alone asked for a freeing of the suffrage from its present harassing restrictions.

THE "ROOSEVELT PARTY."

There is a deep significance in the manner of enacting the Philippine Tariff bill by the House. It means much for the Filipinos; it may mean more for us. Our neglected subjects in the archipelago may take it as a sign that their just demands for a market will one day be granted; and citizens of the United States, angry at the needless imposition of tariff burdens, and looking about to see who will remove the curse of protection, may see in this beginning of tariff revision for the benefit of 8,000,000 Filipinos the promise of tariff revision for the benefit of 80,000,000 Americans. For the House vote clearly reveals the existence of what has been called a "Roosevelt Party," by the resolute use of which one tariff abomination after another could be done away.

The obvious fact is that the Republicans, even with their great majority in the House, could not pass the Philippine bill unaided. Fifty-nine Republicans finally voted against it. Had the Democrats gone solidly against this Administration measure, it would have been beaten by six votes. Yet the Republican managers had distinctly repudiated Democratic assistance. It was a party measure, Chairman Payne announced, and he did not desire a single Democrat to support it. The aged but not venerable Grosvenor was equally explicit. He was for rallying the Republican organization against "Democratic sophistry," and wanted no votes from the other party. In spite of all this, the event showed that one-quarter of the Republican members could be neither cajoled nor clubbed into line; and the consequence was the terrible portent before which Lodge trembled in Massachusetts last October—Republican tariff revision by grace of Democratic votes! Yet the same Lodge announces that he is going to fight "vigorously" to get the Senate to accept the bill. He knows, however, that it cannot be done without the aid of Democratic Senators.

Our point is that there is plainly a majority of tariff-reformers now in Congress. Call it the "Roosevelt Party," or what you will, a body of Congressmen exists large enough, and willing enough, if they had a fair chance to vote their minds, to abolish, we will say, the tariff on art, which Secretary Hay called "barbarous"; to cut the steel duties to the bone; to revise other Dingley schedules radically, and to put the country in the way of securing amicable trade relations with other nations. Of course, before anything is done, the voting must be across party lines. But the Administration frankly contemplates it, even invites it, in other important matters. The President, if he had to depend upon his own party alone, would not have a ghost of a chance of carrying his Philippine bill, or his Statehood measure, or even his bill for fixing railway rates. In them all, his support must be part Democratic. But is it not certain that he could rally this same non-partisan following if he struck boldly for tariff revision by its help?

The votes are there if he will call for them. Let him furbish up that tariff message which has been rusting in his armory for more than a year. Let him begin, if he chooses, with a few of the more flagrant tariff abuses. Mr. Roosevelt must feel as chagrined and disgraced as other educated Americans by some of the more Turkish of our tariff laws. When the united artists and art-lovers of the land send to the White House their protests against a tax which makes our country seem benighted, the President must glow with indignation. But can he any longer assert that it is impossible for him to do anything to sponge off that blot? Every day it becomes clearer that there are in Congress sufficient men to do the work, provided the President will take the initiative courageously and the vicious system of purely partisan arguing and voting on a measure which cuts deep into both parties, is for the moment broken through. It will be a good test of President Roosevelt—to see if he is willing to use the tool which lies at his hand, in order to put his undoubted convictions into effect.

Some Democratic mutterings about Congressman Williams's leadership on the Philippine bill are reported from Washington. It is said that he ought to have seized the chance to beat the Republicans and leave the Administration humiliated; that it is the duty of an Opposition to oppose, etc. But it would be a stupid Opposition that did not take its own when it was offered. Mr. Williams did far better than snatch an empty party victory. He showed that Democrats would approve a measure that was right and patriotic, even if it did not go the full length of justice, and even if it bore the stamp of the other party. More than that, on purely tactical grounds, the Democratic leader was well advised. His course brought out clearly the malign hold of unyielding and unscrupulous protection upon the Republican party. Of the old pretence that the tariff would one day be "revised by its friends," he proved the absolute hollowness. Turning to the Republican side of the House, he said :

"You are going to do nothing about the tariff. The Republican party in its present decadent condition has neither the brains nor the intelligence to remedy tariff abuses. That is the reason why you are going to have a Democratic House of Representatives after the next election.

"Oh, a few stand-patters, with absolute contempt for popular sentiment and absolute trust in the omnipotence of the Committee on Rules and the Committee on Ways and Means, and in our little legislative coteries here in Washington, may imagine there is no outside world. There is an outside world in Michigan, in Wisconsin, in Iowa, throughout all the great Middle West, whose world market for their wheat and corn and meats and agricultural implements is being menaced by the initiation of a commercial warfare by the Emperor of Germany in retaliation for our spirit of commercial exclusiveness. There is an outside world up in Massachusetts. Massachusetts now is crying out for a revision of the tariff."

The question is whether the President is going to unite with Gov. Guild and Gov. Cummins and the other Republican tariff-reformers, and frankly say that, if the Republican party will not do its duty in reforming the tariff, the "Roosevelt Party" is ready to, and will welcome the needed Democratic and Independent votes.

UNCLE SAM AS PAN-AMERICAN RECEIVER.

We are in receipt of the following letter from New Orleans:

"Some of the best-informed and influential men of Santo Domingo believe that if no compromise is arrived at between the Senate and the Executive, whereby the treaty now pending may be ratified in its essential features at least, or the Executive be empowered to negotiate some sort of *modus vivendi* on those lines, Santo Domingo, in order to maintain internal peace and settle with its creditors, would have to appeal to a European nation. Already the movement started about two years ago by a former minister of foreign affairs of the island republic, discussed in a pamphlet published by him at the time, is being thought of as an alternative. This scheme contemplates the lease of Samana Bay for a coaling station and the opening of a free port.

"Should Germany appear in the field as a bidder, would the *Nation* favor a dog-in-the-manger policy on the part of the United States? And: Would the United States be benefited by such an acquisition by Germany of a controlling position in the West Indies?"

Our esteemed correspondent puts compactly a sentiment which many vaguely express. It is that a new and startling situation has arisen in Santo Domingo, requiring new and startling action on our part; whereas, in fact, there is no novelty about it at all. The Dominican republic has for forty years been getting daring speculators to take its paper at 60 to 80 per cent. discount, and repudiating the debt as often as convenient. Her borrowings, like those of several other of the smaller Latin-American republics, have always had *caveat emptor* written legibly upon them. That class of securities long ago became a synonym for insecurity. In Macaulay, Latin-American bonds had displaced the Mississippi bonds of Sydney Smith as the by-word of investors: "The scrawl of the Jew," wrote Macaulay, "on the back of a piece of paper may be worth more than the royal word of three kings, or the national faith of three new American republics."

President Roosevelt and Senator Lodge would make it out that some strange new thing has befallen us in the bankruptcy of Santo Domingo. But it has been chronic. The only novelty lies in Mr. Roosevelt's sudden discovery that the old facts, which seem to him new, demand that he do something unprece-

dented. With the English public, however, all this is an old affair. A writer in the *Monthly Review* for January details some of the facts, so well known to the London Council of Foreign Bondholders. Of several of the turbulent republics of Latin America, it is roundly said that "their borrowing powers are practically nil, whilst the low average price and violent fluctuations in the value of their bonds show how little confidence is felt in their ability—not to say their desire—to pay their way." The obligations of these countries are never taken except by the speculator. He gets them at from 10 to 20 per cent. of their face value, cultivates, if he can, a temporary "boom" on the stock market, and unloads upon gullible investors at a price which doubles his money in a few weeks. Then comes the unwary buyer of worthless paper demanding that his Government send warships like so many sheriffs to collect his debt. The story is as old as it is depressing. Santo Domingo first placed a loan with foreigners in 1869. On it she has been in default for more than twenty years. Colombia bas had a foreign debt for some 83 years, during about 47 of which no interest was paid. The corresponding figures for Guatemala, Honduras, and Venezuela are, respectively, 78 and 48, 78 and 72, 83 and 41. Costa Rica and Nicaragua have been in default for more than half the time. Salvador has repudiated a part of her foreign debt. Thus it appears that, if Uncle Sam is going to set himself up in the business of liquidating all outstanding Pan-American debts, he will not lack for occupation.

The President, of course, proposes to limit himself strictly to Dominican accounts. He repels with more indignation than logic the intimation that he will move upon other delinquent and disorderly republics and make them pay their debts and live cleanly. Yet he ought to know that the holders of their depreciated bonds are drawing the inference which he declares unwarranted. The writer in the *Monthly Review* states that the unlucky European investors in Latin-American securities have, since President Roosevelt's announcement that he is going to make Santo Domingo behave, "learnt to look upon the United States as the *deus ex machina* who will transmute their almost worthless paper into pure gold, and a phenomenal inflation in prices has consequently taken place." Surely, Mr. Roosevelt would not wish to dash these new and fond hopes! He ought, at all events, to take note of a plain warning given him in the *Review* on one point. A formidable difficulty in his entire Dominican plan has all along been his assumption that it would be easy for him to determine what "proportion of the debts it is possible to pay on an equitable basis." But there's the rub. There is no evidence that the President, or any of his agents, has thoroughly examined the various claims of creditors—creditors in good faith. Mr. Roosevelt has lightly dismissed this aspect of the matter. When the time came, he would get an absolutely "just" man to look into the tangle of accounts, and say what should and should not be paid. But there can be, "Investor" informs us in the *Review*, only "serious misgivings" on the part of foreign bondholders as to the degree of discrimination" against them which an American liquidator in Santo Domingo might exercise. It would be a bad bargain to make our peace with Santo Domingo at the cost of misunderstandings with a half-dozen European nations.

But what are we to do? What would you do yourself? Such are the posers put to every one who questions the wisdom of the President's Dominican plan. But the reply is simple. We should keep on doing just what this Government always has done: warn speculators who take a "flutter" in foreign bonds or concessions of any kind, that they do so at their own risk, and that the American navy will never be made a bailiff to collect bad debts. If any of our citizens come forward with valid claims for damages against Santo Domingo, the State Department should do what it can to see that justice is done them. One would think, to listen to the President, that the United States had never had troublesome claims to settle. A Dominican Claims Commission, however, would be but one more in a long list of such bodies. Mexican Claims, Colombian Claims, Venezuelan Claims—they, in their time, have all been patiently studied and adjusted by friendly negotiations, without a single swish of the Big Stick. The burden of proof is upon those who say that the same thing should not be done in Santo Domingo. As for our correspondent's alarm about Germany seizing Samana Bay if we do not forestall her, we need only say that we think the "sausage trick" will no longer work in inducing Americans to take territory they do not want. We refer, of course, to the artifice of the man who had wagered that his dog could eat a dollar's worth of sausages. Whenever the animal showed signs of satiety, the owner would bring up another dog threatening to eat the rejected morsel, whereupon the first one's appetite would be miraculously renewed. But that German dog has been too often and too ostentatiously brought on the scene.

CHANGING VIEWS OF ARMIES.

Col. Charles W. Larned, senior professor at the West Point Military Academy, has contributed to the *International Quarterly* a striking article proposing a regeneration of the army, so as to make service within its ranks a privilege greatly to be desired. He has looked beneath the surface, and, like the French Socialist leader, Jaurès, he finds that modern social and political conditions have brought with them a changed relationship of the people towards military service. The underlying conception hitherto, Col. Larned points out, has been "fundamentally feudal," no matter how much this may have been concealed or affected by certain political institutions or conditions. The bond of service by which the soldier is held; his inability to change employers at will; his social inferiority as compared with the officer; the "annihilation of initiative and complete subordination of will"; the claim upon his life, and other circumstances—even where enlistment is voluntary—suggest the conditions of the feudal serf. As a result, there are protests not only in this country, but in Europe as well. Bebel, like Jaurès, has bid his Government beware of the thinking bayonets, which are now to think not only on reaching the firing line, but first whether they should be required to form it.

Even outside of the Socialist ranks, there are mutterings against what is so essentially a system of caste. The Continental middle-class citizen feels akin to the Socialist when he hears Jaurès call for a democratization of the army. Within a year the Berlin *Tageblatt* has devoted many pages to protests against the great proportion of noblemen in the army and the exclusion of commoners from the officers' lists of many fashionable Prussian regiments. The well-to-do Berlin or Hamburg merchants resent more and more the supercilious airs and intolerable conceit of the wearers of the Kaiser's uniform, and one of the most popular German novels of recent years centres around the unavailing efforts of the son of a business man to hold his own in a regiment in which he alone among the officers was not of noble birth. Besides these social influences which make for democratization, modern fighting conditions have tended to create a new relationship between officer and private. The latter has, as Professor Larned shows, gained of necessity a self-reliance and initiative entirely at variance with the automatic idea. This has been sufficiently illustrated in Cuba, the Philippines, and South Africa.

Professor Larned, too, thinks the rigid discipline of inferiority and separateness no longer desirable. The problem in this country, as he sees it, is to change military conditions so as to make the army an institution of great value to the soldier, not only because of high pay, but because of the general education or technical training he may get out of service. Our army, Col. Larned affirms, has in time of peace to rely

upon a "drifting and uncertain body of the unemployed, social failures, and tramps, fluctuating in number according to periods of commercial distress or prosperity," and is "a sort of forlorn hope for the desperate, and a last resort for the poor devil who is down on his luck." As a result of this sort of recruiting, last year's statistics showed that one in every ten of our soldiers deserted and one in every six was treated in hospital for diseases due to immorality—a sorry showing, as has been freely admitted by the Military Secretary and the Surgeon-General. The former, Gen. Ainsworth, saw no prospect of betterment ahead so long as the attitude of our people towards their military remains the same. What he and others probably have in mind is a change of public opinion, so that a deserter will rank with a burglar or forger; the coming of a time when the service of the Government will be considered sacrosanct because of a blind patriotic devotion to the flag. Something of this kind is still possible in time of war, but not during peace. Hence, Col. Larned would establish the army in the affections of the people by making its work remunerative and useful; his regiments, assembled in five or six posts, would be training-schools for making officers out of enlisted men—those discharged into civil life to receive certificates of eligibility for commissions in time of war.

Instead of demoralizing the soldier and rendering him unfit for steady work thereafter, Col. Larned's plan would restore him to civil life, "improved and developed mentally, morally, and physically—an orderly and conservative element in society." Certainly, such a change is needed. In the West, particularly, the average workingman looks on the soldier as a loafer who is unmanly enough to let another man "boss" him. To "soldier" has become a verb synonymous with shirk or laze, unjustly in view of the changes in army conditions since 1898; but the statistics we have quoted show that there is often good ground for suspecting those who have been in the ranks.

Of all the regeneration schemes we have yet seen, Col. Larned's is the best, but no officer can be found to-day who will admit that it is possible; and merely because of the great increase in pay called for, Congress would hardly consider it. Yet we doubt whether the scheme would long make a paradise of the army if it should be introduced to-morrow. To kill in cold blood and to stand the hardships of a campaign require, so some of Col. Larned's military critics will say, a rougher kind of schooling than that the dean of West Point has in mind. But, aside from the technical doubts which may be raised, the very facts upon which Col. Larned dwells at the outset show how impossible it is to forecast what the attitude of the public toward armies will be fifty years hence. It may be much as it is to-day; or, if the movement towards peace progresses, as it must, the trade of killing may fall into greater and greater disfavor at home and abroad. The devotion of the Socialists to peace points in that direction. Moreover, as industrial competition increases, the popular dislike of economically unproductive labor like that of soldiers will steadily increase.

"SEE AMERICA FIRST."

"The committee of the Commercial Club having in charge arrangements for the 'See America First' Conference in this city, January 25 and 26," says an Associated Press dispatch from Salt Lake City of January 18, "announces that representation is now assured from all the trans-Mississippi States and from Duluth on the north to New Orleans on the south." This will convey to many persons the first information of a concerted movement to persuade them to see America before they go to Europe. It is a missionary enterprise intended to call Easterners to repentance. Any man who dwells beyond the Mississippi must necessarily see more or less of America before he can even set foot on a trans-Atlantic steamer. As a matter of fact, the Westerner who can afford to travel at all is fairly familiar with the cities of the East. It would be hard to find a successful business man in St. Paul, Minneapolis, Omaha, Denver, or San Francisco who is not entirely at home in Chicago, St. Louis, New York, and Philadelphia, and who has not "done" all the sights of Washington. Your prosperous Seattle lawyer or merchant makes less ado about coming to New York than your New Yorker makes about going to Buffalo or Cleveland.

That is why the West very justly calls the East provincial. The Western man has a far more accurate knowledge of the topography of this country, the agricultural and industrial products of the various sections, the appearance of cities and villages, the public institutions, and the temper of the inhabitants. The men who sit in comfortable clubs in Boston, New York, and Philadelphia often display an abysmal ignorance of the political issues which have provoked the Middle West into a white heat of indignation. Graduates of our Eastern universities are prone to speak with condescension and pity of the unfortunates who have never had any advantages beyond those offered by the State universities of Michigan, Wisconsin, Nebraska, and California—as if there were no civilization west of Elmira. From this type of bigotry the educated Westerner, with all his local enthusiasm and his large talk of fertile soil and inexhaustible mines, is agreeably free.

The Western gospel will, we trust, carry conviction to the hearts of our effete sinners. The West has much to show us. The cities are bustling and interesting. To speak frankly, however, they are not the greatest thing which America has produced. Cleveland, Cincinnati, Detroit, Chicago, St. Louis, Kansas City, Omaha, St. Paul, Minneapolis, and Duluth have developed in the same period; they exhibit the same types of architecture, they have many other features in common. A few days in each of them will satisfy a sight-seer who might profitably spend months or years in ten of the leading European cities. Such Southern cities as Richmond, Charleston, St. Augustine, and New Orleans have more individuality and charm. Parts of New Orleans still breathe something of the air of a French provincial town. Denver in its moutain eyrie, Salt Lake City with its Mormon settlement, Helena and Butte surrounded by mining camps, Los Angeles in its semi-tropical splendor, San Francisco seated on the hills by the Golden Gate, guarded by the peak of Tamalpais, and trafficking with the Orient; Portland, lying near the Columbia; Tacoma and Seattle, with the magnificent snow-cap of Rainier, the jagged line of the Olympics, and Puget Sound to seize the eye from every point of outlook—each of these cities has its lesson for Americans who want to know their own land. On the glories of our natural scenery—Niagara Falls, Pike's Peak, the Garden of the Gods, the Yellowstone, the Grand Cañon, Yosemite, and all the rest—we need not dwell. Everybody knows that these sights draw visitors from Europe.

Why do so many Americans remain indifferent? Partly, no doubt, because, when they have time and money for travel, they want to turn to something wholly new—get out of the American atmosphere. In its art galleries, its public buildings, in every street of its ancient cities, Europe offers opportunities for enlargement of vision and of the sense of historical perspective, and for a development of the æsthetic tastes. which cannot be found this side of the Atlantic. For this reason many persons are content to see America last. Then, too, the sea-voyage itself is a strong attraction. A week or ten days on the ocean means for some people as much rest as a month of travel by train or even of life in the wilds. With rich and poor alike, these considerations weigh heavily in choosing between a trip to England or California.

But with the great mass of men who must reckon the cost carefully, the expense of travel in America is decisive. In six weeks or two months, the person who is willing to practise decent

economies gets more for his money in Europe than in the United States. A round trip ticket from New York to San Francisco costs, according to the route, between $145 and $163. A berth in the sleeper is about $20 more; meals for five or six days on the train, at least $3 a day. But for $150, or perhaps less, one can secure very pleasant accommodations to Liverpool or a Continental port and return, including room and excellent meals. In its hotels Europe has an even greater advantage. Few of our cities can boast well-kept, clean comfortable, and at the same time low-priced hotels. A man travelling with his family must make up his mind that unless he can pay the bills at the best hotels, he must put up with inattention, poor cooking, and dirt.

These facts the Western missionary must not overlook if he is to succeed in his propaganda. He must induce the railways and the Pullman Company to lower their rates. The heavy cut for the Portland Exposition drew thousands to the Pacific Coast last summer, and steady low fares would doubtless prove a steady attraction. He must instantly improve his hotels. The work of reform may properly begin in the very place where the conference is to be held—Salt Lake City. Until the fares are lower and the hotels better and cheaper, conferences can accomplish little if anything.

ART FORGERIES IN MUSEUMS.

Prof. Adolf Furtwängler, the famous classical archæologist, has lately given his impressions of an American trip in the unpleasing form of a list of our museums that have notably been taken in by art forgeries. In this category appear the Metropolitan Museum and the Field Columbian Museum of Chicago—both for "post-classical" terra-cottas; the Smithsonian Institution, for American antiques of recent fabrication; the University of Pennsylvania, for the large sprinkling of modern and spurious examples in the Somerville collection of carved gems. These revelations, which are only in part new, have been variously discussed by the authorities of the museums in question, but nobody has said very much to the point except a Chicago donor, who holds that the local collections, if not absolutely authentic, are as much so as a new institution had any right to expect; and Sir Caspar Purdon Clarke, who declares that forgeries should by no means be excluded, but, when of excellent quality, should be exhibited as of the period in which they were made. This would involve, for example, classifying the "Olbia" gold crown presented to the Museum by Mr. Morgan as "Russian, XIXth cent., by Rukhomoski, the fabricator of the notorious tiara of Saitaphernes."

The merits of a view which errs, if at all, on the side of liberality, we shall consider later. But it should be prefaced that the possession of art forgeries is discreditable neither to public nor private collector. They abound; they are often most skilfully made; they are sometimes patched up from the *disjecta membra* of genuine objects in a fashion to deceive the very elect. They are urged upon enthusiastic amateurs by dealers who combine in an extraordinary degree audacity and astuteness. No collector of any enterprise can fail thus to be taken in occasionally, and the curator who never snapped at this dubious sort of bargain would presumably be too timid to spend his annual appropriation. Moreover, museums often come into possession of these embarrassing exhibits by accepting gifts of entire collections which contain many desirable objects. So the Moore bequest at the Metropolitan Museum was in general an excellent acquisition, though every one of its Tanagra figurines is flagrantly modern. The practical questions for a director, then, are first how to keep forgeries out as much as possible, and next what to do with those that must inevitably slip in.

Here Sir Caspar Purdon Clarke's rather sweeping suggestion is welcome to the extent that it places the problem purely on an artistic basis, and declines to condemn the entire class of imitations on moral grounds. Evidently, if a forgery is of equal beauty with an original, it is equally available as an art exhibit, and needs merely, in the interest of historical accuracy, to be properly labelled and dated. Some collectors frankly take the ground that they buy what pleases them, and that age and authenticity are minor considerations. We know of a most enlightened picture buyer who had made an offer to a dealer for a "fifteenth-century" panel that was plainly the product of a cleverly managed Sienese establishment. When this came to the dealer's notice, he promptly notified his customer, only to receive a renewal of the offer from a collector who was willing to waive the question of authenticity and abide by his taste. In certain cases this attitude is commendable. The South Kensington Museum did well to make a separate exhibit of the portrait busts by Bastiani; and anybody who has bought that true artist's work under the name of Donatello, Desiderio, or whatever early Renaissance sculptor you will, is lucky—if he has not paid a Donatello price. Similarly, a great part of the best Chinese porcelains might be classified as forgeries, since the potters imitated, generation by generation, not only the patterns, colors, and glazes of their predecessors, but also their marks.

Yet here one must distinguish between a genuine revival of an ancient style, or the faithful transmission of the precedents of a craft, and fabrications made with intention to deceive. Because the *entrepreneurs* of Florence managed to catch in Bastiani an archaizer quite as sincere and gifted as, say, the late Burne-Jones, and the more recent employers of the master craftsman Rukhomoski have been lucky in their man, it does not follow that the mass of art forgeries are works of art. That they seldom are. The counterfeit Diazes, Michels, Monticellis, Corots that pass through our auction rooms are of generally contemptible, at best of merely specious, quality. The superficial gracefulness of the modern Tanagra statuettes is essentially cheap as compared with the real distinction of the rare genuine examples. The Japanese version of an ancient Chinese porcelain is never quite true in texture and color. That they are in most instances indistinguishable from the original to an untrained eye proves nothing. The art of a thing depends upon ultimate and frequently incommensurable refinements. The duty of museums is to train the eye to perceive these distinctions, not to efface them under a mantle of false catholicity.

It cannot be too strongly stated that most forgeries are not art of any period. Any apparent merit they may possess is merely a reflection—a dilution of the quality of some fine original. Even the marvellous intaglios which Prince Poniatowski had cut, to the confusion of collectors, are no more to be compared to good Greek gems than the decorative art of the French Empire is to be compared to that of Rome and Egypt from which it was derived. Exceptional circumstances may warrant the honorable exhibition of these falsifications; in general, the only proper course to take with them is that of the Boston Museum of Fine Arts—put them into an appropriate Botany Bay; show them for the pretences they are, as a lesson in humility to experts and as a warning to untutored enthusiasts.

FOGAZZARO'S 'THE SAINT.'

ALASSIO, December, 1905.

The literary event of the year in Italy has beyond doubt been the publication of Fogazzaro's novel, 'Il Santo.'* The author, after many years in which he was known only to the few, has become in the general estimation one of the three writers who, each in his own way and degree, may be said to stand as representatives of the literature of modern Italy—the other two, it is scarcely necessary to say, being Carducci and Gabriele d'Annunzio. It is a matter of course that the publishers should seek to make a good thing out of their author's present popularity; never before have I known a village bookseller to solicit orders before publication.

*'Il Santo: Romanzo.' 10° migliaio. Milan: Baldini, Castoldi & Co.; New York: Lemcke & Buechner. [1905], 1906.

and, especially as the 5th of November drew near, the newspapers stimulated curiosity by the indiscretions familiar in other lands, with the result that the copy handed to me a day or two after that date bore on the title-page the words "8° migliaio." But it has been owing to the book itself, and to the eagerness of the discussion that it excites, that the subsequent sale has been almost, if not quite, unprecedented.

That is to say, the show to which this modest drum-beating has invited us, exceeds expectations—it is really of an unusual order. As Arturo Graf, in the *Nuova Antologia*, said: "Three books in one: a book of faith, a book of battle, and a novel." 'Piccolo Mondo Moderno,' after 'Piccolo Mondo Antico,' had not led us to look for, as a close to the trilogy, a work which, on a higher plane than its two immediate predecessors, is of a more intense interest, and is perhaps the master work of the artist. The *Saint* is Pietro Maironi, who, after the vacillations, the questionings, the restless discontent of which 'Piccolo Mondo Moderno' is full, at the end—after a vision, wherein his future life as a servant of God is revealed to him—accepts his vocation, and disappears from the world that has known him heretofore.

In the present volume he reappears, under the name of Benedetto, as a saint of the well-known mediæval type, as far as outward seeming is concerned. He macerates his body by fasting and by menial toil; he spends nights on the mountain-side, in prayer, chilled by the winds and drenched by the rain. Ignoring the position conferred on him by his birth and culture, he is the lowliest of the lowly, the servant of the poorest. Saint Simeon Stylites might have mistaken him for a brother.

And yet he is more than a mere ascetic striving to atone for his sins. In the intensity of his love for his fellow-man he is more akin to Saint Francis. But, together with the love of a Saint Francis, the burning aspiration toward purity of a Saint Simeon, the humility of any saint of the martyrology, he has somehow fused the culture of to-day. One would have said that if such an anomaly as a modern saint be possible, he must be sought for among the poor in spirit, the meek, the lowly, who are also the ignorant—unsophisticated by any illumination of science. But while the teachings of Benedetto thrill with the spirit of the Sermon on the Mount, he recognizes that the theory of Evolution may explain the history of the human race, or that right living is more important than right belief. Indeed, in matter of belief his tenderness covers all sorts of errors, from skepticism on one side to superstition on the other. In a remarkable passage among his last utterances, after admonishing his followers to adore above all the truth, and to teach "that there is no truth hostile to God, nor contrary to His law," he adds, "But watch with equal care lest the children taste the food of their elders. Do not be offended with an impure or imperfect faith where the life is pure and the conscience healthy." All this may seem to you scarcely noteworthy, living in a land where varieties of belief are almost as numerous as are believers, nor would it seem remarkable in any cultivated layman of Italy; but such doctrine is scarcely taught by priests, and least of all by ascetics. This saint, however, is moved by a lofty spirituality that takes small account of outward form and dogma, and clings solely to what is essential and eternal in religion. And what gives to his spirituality its greatest force is that it is fused with a passionate tenderness for his fellow-man; it constrains the reader who lets himself be borne along by the noble fervor that animates Benedetto.

Still, sooner or later, the wonder arises why one whose vision is so clear should waste his force in mortifications of the flesh—why he did not see that they are worse than useless; why his culture, his spirituality, his reason—one hesitates to call it common sense—did not from the very beginning make these aberrations impossible. The book offers a number of questions for solution. I shall try to answer some of them in my own way, though hesitatingly, as I am not sure of understanding rightly. A second reading might modify more or less my conclusions. It seems to me now that, whatever the contradiction involved between Benedetto's teachings and practice, the book would have failed of its purpose without that apparent contradiction.

But first let us inquire what that purpose is. This is not the least perplexing of the questions suggested by the book. At first I thought, like nearly everybody who has read it, that it was an effort to promote greater spirituality in the Catholic Church, a return to the purity and simplicity of apostolic days, and at the same time to bring it into harmony with the accepted truths of modern science that have long been estranging from it the laity. It is by no means new to us that this double cause is dear to Fogazzaro's heart, and in these days the wind everywhere blows that way. It is frequently said that this wind comes from across the Atlantic, and it may be so; at all events it is felt in every country of Europe—most of all, perhaps, in France, where even the clergy, even the higher clergy, seems to be deeply affected by it, and least in Germany, largely because the "Old Catholic" movement affords a refuge for many of the discontented. In Austria, Father Vogrinec (I am not sure of the orthography of the name, as I draw my information from an Italian source) has published a book upon the causes of the decadence of the Roman Catholic Church, and the remedies therefor, which approaches its subject in quite another manner from that of Fogazzaro's Saint. Benedetto's light is always "with grace divine imbued," while Father Vogrinec would seem to be of those who call a spade a spade, and proposes definite and bold reforms—that of religious teaching and of the catechism, the abolition of clerical celibacy and of the obligation of fasting, a more active participation of the laity in the administration of the Church, a reform of the worship of the saints and of relics, the admission of more non-Italians into the Government of the universal church, etc. The book was promptly put upon the Index, as had been those of the Abbé Loisy and of the German professors Schell of Würzburg and Müller of Baden. Father Vogrinec, like his predecessors, declared his submission to the ecclesiastical authorities.

In Italy the movement has the same general character that it has in France; it aims at a more rational catholicism, a faith that does not ignore modern science; at the same time it does not assert itself so strongly, but is marked by a certain conservatism which rather resembles timidity. Fogazzaro's Saint may be said to be fairly representative of the Italian spirit of reform. His teachings are noble and persuasive—indeed, they could scarcely be otherwise when delivered in such melodious prose; but they have nothing of the sharpness of attack in them. Perhaps it is for this that, contrary to general expectation, the book has not yet been put upon the Index. Or perhaps it is because a kindred sentiment has begun to penetrate the precincts of the Vatican: there are indications—faint, often obscured, but recurrent—that the stronghold of obsolete faiths and practices is being invaded by modern ideas.

Still, there are plenty of evidences in this book that Fogazzaro does not expect much encouragement from that quarter. At the house of Giovanni Selva, the layman whose writings teach the renewed faith and the new exegesis, there is held a meeting of friends, mostly priests, of similar views to his own; but among them there is an informer, and, as a result, one after another, every priest who was present is made to feel the wrath of his superiors—extinguished, so to speak. In fact, the higher clergy are continually represented in any but favorable colors. We have them arrogant, worldly, intolerant, place-seekers, politicians, and not scrupulous ones either. Even the Pope—whose figure as drawn here reminds one of a beautiful statue illuminated from within—who strongly impresses us with his dignity, his gentleness, sweetness, and purity, reveals himself as much a statesman as a priest; he cannot govern his church according to the ideas of the saints, who are few, when he must always have an eye to the scribes and pharisees, who are many. He is glad to serve Benedetto in a particular matter, but he cannot hope to satisfy him completely until they shall meet, as indeed he trusts they will, in another world.

No, Fogazzaro makes it clear that the struggle for a purified faith can look for little sympathy in a church governed as this is. He makes it so clear that for a while I was convinced that the purpose of his book was to show that he despaired of reform from within; that the many laymen and the handful of ecclesiastics who desired such a thing would find in the end that they must do as previous reformers have done—find another church for themselves. For it is not only the higher clergy, the scribes and pharisees, who will not hear of change; what can be done with the ignorant herd, steeped in superstition, who throng after the Saint so long as they believe that he can heal their sick, save their crops from blight, or their cattle from disease, but are ready to stone him as an impostor the moment they begin to doubt his supernatural powers? Or the cultured classes, whose members are contemptuous or idly curious where they are not openly hostile? Or the civil power, outwardly estranged from the Vatican, but secretly bartering political services with it, and accepting any pretext to sacrifice Benedetto to his enemies? What is to be done in a world that is not only incapable of understanding what it is to "hunger after righteousness," but is

dead to every noble emotion? Superstition, indifference, and corruption are of course hostile to all spirituality, whether within or without the church. It is only because Benedetto and those who share his convictions wish to remain within that the seeming impossibility of persuading their superiors makes their case appear so hopeless.

Finally, however, I return to the original belief. A little leaven may leaven the lump, and many scattered indices assure me that Benedetto (or Fogazzaro, as you will) believes in the final triumph of the cause that he advocates. The sheep will not be constrained to leave the fold in order to gain the green pastures and still waters for which they long—the fold will be enlarged, its old barriers thrown down; but meanwhile the sheep should bide in patience the time of the Good Shepherd. "What faith is yours if you talk of leaving the church because certain antiquated doctrines of its chiefs offend you, certain decrees of the Roman congregations, certain directions of the government of the Holy Father?" The great church is the great body of the faithful who believe in God, and this remains unchanged, no matter what may be the errors of its rulers.

But to return to our first question. It is asked again and again: Why should this modern—cultivated and a man of the world—go back in his practice to the obsolete superstitions of the Middle Ages? Why should he emaciate his body with fastings and vigils, why waste his hours in unworthy toil, why refuse the love that is offered him and that he might accept without blame? Would his teachings be any the less pure and noble were he in the enjoyment of the advantages that were his by birth, and his life enriched by the love of a woman who was his equal in qualities of mind and heart? I may be mistaken, but it seems to me that the rationale of this saint is primarily a question of art. A comfortable bourgeois preaching reform, what is he to the artist alongside of the "voice crying in the wilderness" of a new John the Baptist? But our author has had other and more potent reasons. He has in Giovanni Selva given us the layman who approaches the questions of reform from the intellectual side. His figure is a noble one, but, although a Catholic, he is only a layman, and in that sense an outsider to the church. But Benedetto, though not a priest, has the authority of one at the centre of its organization. Who so fit to preach a revival of faith from within as an *illuminato*, stamped with the recognized signs of a divine mission? If Selva be the regenerating mind, Benedetto is the heart, and a heart that beats so strongly and truly that it ought to compel the body to which it belongs to a sounder life.

The book is an epitome of the religious convictions and aspirations which the author has embodied in his previous works, and which remain always the same, only matured, widened, and quickened by a more profound humanity. It is the consummate fruit of a lifetime of growth. And it is also a novel. As such, after the first chapter, in which is felt a certain artificiality, as if the author were not yet quite at ease in his machinery, it seems to me to possess a unity, an intensity of life, that should put it into the foremost rank, if not at the head of his creations. It is not only the climax of a trilogy; it has the finality and solemnity of the crowning work of a life. The humor, without which Fogazzaro would not be Fogazzaro, is there, but it is chastened, and alternately either severer or tenderer than heretofore. For vividness of portraiture and humor the pages describing the meeting at Selva's house, the ladies who listened surreptitiously to Benedetto's teachings, and the interviews with the representatives of the civil power are among the most brilliant of our author. I have heard one or two speak of *lungaggini*, but I have not found them myself, and I suspect that they exist only for those who are not quite in sympathy with the spirit of the book.

The opposition that 'Il Santo' arouses is as a declaration of religious convictions rather than as a work of art. The radical, anti-clerical or anti-religious, and the sects of the scribes and the pharisees in their entirety, pour out vials of wrath upon it. And yet the number of its readers is always increasing, and the many who feel the need of a purified faith, or of informing their faith with reason, will find it full of suggestion. As Édouard Rod wrote in the *Figaro*, this is one of the books that most lend themselves to criticism, and best resist it. Whatever may be its effect upon the visible Church, if any, it is a distinct gain for the invisible one which reigns in the hearts of all good men. S. K.

THE MOZART FAMILY IN PARIS.

PARIS, January 4, 1906.

The journey of Mozart, father of the immortal musician, to Paris is one of the curious episodes in the life of the eighteenth century in the French capital. The collection of portraits by Carmontelle placed by the Duke d'Aumale in the château of Chantilly, and now under the care of the French Institute, is an admirable illustration of the elegant society of the time. Carmontelle was not a first-rate artist, but he had a great feeling for color and a sort of genius for catching the true likeness of his models. In one of his beautiful colored drawings we have an exact portrait of Mozart, the father, and his two children, whom he had taken to the Duke de Chartres, at the Palais-Royal. The father is in a red coat with red culottes, the daughter in a flowered white gown, the little Wolfgang in a beautiful blue coat adorned with white lace. In the centre of the group, the young Wolfgang is on a chair before a piano; the father, behind him, plays on a violin; the young daughter is represented singing. This picture has been reproduced in a good engraving by Delafosse. There is a photograph of the original aquarelle of Chantilly in the fine volume published by M. Gruyer on Carmontelle's portraits in the Musée Condé.

The father of Mozart arrived with his wife and his young family in Paris in November, 1763. He wrote to a friend in December: "We are arrived and lodged in the house of the Bavarian Ambassador, Count von Eyck, who received us in the most friendly manner, and had prepared for us a room where we are very comfortably installed; an advantage which we owe to the recommendation of the family of the Countess von Eyck." France always entertained most friendly relations with the elector of Bavaria. Count von Eyck inhabited the Hôtel de Beauvais, one of the most magnificent houses at the time in Paris, between the Rue St. Antoine and the Rue de Jouy. There remains of it now only the façade, which is much mutilated, a little court, and a fine staircase. The Bavarian envoy was of Flemish origin; his real name was Van Eycken; he leased the lower part of this hôtel to bankers (if the name is applicable), who made of it a gaming establishment. The protection of a person who made such an extraordinary and lucrative use of his diplomatic privileges, was not the best that Leopold Mozart could choose to introduce himself and his children into the great French families and the Court of Versailles. He had, fortunately, many letters of introduction—to the Austrian Ambassador, to several important members of the French aristocracy.

He had made the journey to Paris in the hope of reaping a small fortune. While he was spending his time in ante-chambers, his wife and children visited the churches and the monuments of Paris. Young Wolfgang took much pleasure in the amusements of the boulevards, which were as animated at the time as they are nowadays. In the evening hours he played the piano and repeated the various airs which he had already composed. Four days after his arrival in Paris he began to write his second sonata for the pianoforte. He had brought with him another sonata, which he left interrupted. We have in a quarto album published at Salzburg in 1872 ('Salzburger Mozart-Album') a facsimile reproduction of the andante which began this unfinished sonata. M. Doumic, who has written interesting articles on the youth of Mozart, infers from this sonata that he was careless. "After a first line written with much care, the notes by and by become uneven and get mixed, the bass notes marking the measures are thrown in at random, till on the third line the tired hand of the child makes an error in indicating the passages which are to be repeated, and makes nervous corrections." Nevertheless, the musical motive has its clear and definitive form; it is perfect. It is because, during his whole life, from his earliest youth till the end of his too short career, Mozart always composed in his head, and wrote his notes on paper only after his idea had attained in his mind its complete and harmonious form. He did not need the physical excitement of writing; the material part of the work was to him only an annoyance and a fatigue.

This andante is entirely free from the musical traditions which were current at the time. It is a specimen of what we can only call the Mozartian manner, a pure flow of melody, without anything artificial. It may be supposed that the young boy began it at Brussels, immediately after having composed his first sonata, while he was waiting to be presented to the Archduke Charles and to give his first concert.

The *Mercure de France* of the month of May, 1763, announced the publication in Paris of "Six Sonatas for the Clavecin" by J. G. Eckard. This Eckard had already been several years in Paris; he was a compatriot of Leopold Eckart. His work was probably presented to young Mozart as a model; his sonatas have still the left-

hand accompaniments which were used at the time, which are very mechanical, and play, so to speak, no other part than to make a sort of tremulous noise. This system, which went under the name of "basse d'Alberti," had been adopted by Eckard as being in accord with the French fashion, but he was well acquainted with the works of the two Bachs, and their influence is felt in his sonatas.

The letters which Leopold Mozart brought with him were not honored with replies for a long time; at last, he was received by Melchior Grimm. Grimm had arrived at Paris in 1749, at the age of twenty-five, and had gradually made his way in society. He belonged to the coterie of the Philosophers. He received Leopold Mozart and his young son, and as soon as he saw the little Wolfgang he took an interest in him:

"This M. Grimm, my great friend," writes Leopold Mozart, "is a very learned man and a great philantropist. He, and he alone, has done everything for us. See what a man who has intelligence and a good heart is capable of. A German from Ratisbon, he has been in Paris for more than fifteen years; he understands marvellously how to arrange everything in the way in which it must perforce succeed, when he has resolved that it shall."

Grimm's correspondence begins on the 1st of December with a great eulogy on young Mozart; it has often been cited as the most important document we possess regarding Mozart's first visit to Paris: "True prodigies are rare enough to make it obligatory on us to mention them when we have occasion to see them. . . . What a pity," he says, "that people should know so little about music in this country!" This letter was a sort of circular, and was sent to many people. A new life began for the Mozart family; they were invited to many places. We read in the letters of the father, on the 8th of December: "To-morrow, a sitting with the Marchioness of Villeroy and at the Countess of Lillebonne's." They certainly appeared at the house of Madame d'Épinay, the great friend of Grimm; at the Baron d'Holbach's, whose wife was a musician; at the houses of the farmers-general. Young Mozart was presented at the Palais-Royal. If he was not heard by the Duke de Chartres, who was then sixteen years old, he was by his sister, to whom he dedicated, two years afterwards, a rondeau. It was at the Palais-Royal that Carmontelle saw him and made the charming aquarelle in which he was represented. During the stay of the Mozarts in Paris, they received visits from the three best performers on the piano of the moment, Le Grand, Eckard, and Schobert, who, says a letter of Mozart the father, "paid homage to the children for their engraved sonatas." Le Grand was the organist of the Abbey of Saint-Germain-des-Prés. Eckard was a native of Augsburg; he was at the same time a painter, decorating small boxes, after the fashion of the time, with little miniatures, and employing his savings in printing sonatas of his composition. "The most honest man in the world," says Leopold Mozart of him. Schobert was a native of Silesia; he was pianist of the house of Conti, and had achieved great success already by his sonatas.

The great object of Leopold Mozart's ambition was to present his children at the court of Versailles. He remained there for two weeks. He had promised the Archbishop of Salzburg to send him a detailed account of his reception; this document, unfortunately, has never been found, though it probably still exists; and we find no trace of this event in the French letters or memoirs of the time. There is only this mention in the books of Papillon de la Ferté, who kept an account of the expenses of the court: "On the 12th of February, by order of Mesdames, fifty louis to a child who played the piano before them." We have, however, some confused details in the letters of Leopold Mozart to his friends, the Hagenauers. His descriptions are very glowing. He sees in the Royal Chapel the King and his family, he attends the midnight mass. "There before me was that court whose renown fills the universe." He gives details respecting the music of the chapel. There were four princesses at Versailles, very fond of music —the Queen, the Dauphiness, Madame Adelaide, and her sister Madame Victoire. Mozart's children played before the Queen, but no trace is left of the details of the concert. A great event for the Mozart family was the *Grand Couvert*, where they approached the royal family.

"The Queen's daughters, on seeing my children, came near them, and not only allowed them to kiss their hands, but kissed them themselves repeatedly. At the *Grand Couvert* on New Year's Day they made room for us behind the royal table, and saw my Wolfgang stay, all the time, behind the Queen, kissing her hands, and eating the *friandises* which she took for him from the royal table. The Queen speaks German as well as we do; and, as the King does not know a word of it, the Queen translated to him all our little hero said."

The child, when he returned to his modest room in an inn, continued to work, to perform and to write music. These details would be very trifling if it was not a question of Mozart; but nothing can be uninteresting about this wonderful genius. Did France and the glories of Versailles have any influence on his development? This influence may perhaps be found in the two sonatas which he conceived and probably wrote during the five months which he spent in Paris.

Correspondence.

NATIONAL REGULATION OF STATE REBATES.

To the Editor of The Nation:

Sir: If it is such a terrible evil that railroads should give rebates or discriminate between shippers that the Federal Government ought to proceed at once to stamp it out, why are not State rebates a similar terrible evil that should be similarly stamped out? By "State rebates" is meant the total or partial remission of taxes by the State or some municipality therein for the purpose of inducing a particular individual, firm, or corporation to establish an industry in a particular locality. There would seem to be no difference in essence or principle between a rebate or discrimination in railroad rates and a rebate or discrimination in public taxation. These municipal rebates are, if the writer is not mistaken, sanctioned by statutes and upheld by the courts. The municipalities exercise this power of rebate and discrimination, because they find, like the railroads, that it is good "business" to do so.

The writer is not undertaking to defend either evil, but merely to point out that they appear to be essentially the same thing. Robert S. Minot.

Boston, January 15, 1906.

THE ELECTION OF REPRESENTATIVES.

To the Editor of The Nation:

Sir: Your editorial of January 11, on the "Automatic Tariff Brake," attributes to "the fathers" the system whereby the second session of Congress is too short for legislation and the first or long session is hampered by the impending election; whereby Congressmen meet for the first time thirteen months after their election, and for their second session after their successors have been chosen. The curious thing about this noxious arrangement is precisely the fact that it is not inherited from the days when defective transportation might seem to have made such delays inevitable; it is not the result of filial piety, but of self-immolation. The fact seems to be generally forgotten that, before the civil war, ten of the fifteen slave States and five of the eighteen free States followed the sensible plan of electing their Congressmen in the odd year. A man was elected, served, and went before his constituents again with his record complete. Connecticut clung to this system until 1873, Oregon and California until 1875, and New Hampshire until 1877. It was done away with, doubtless, on the plea of economy, and with the object of preventing its disintegrating effects on party organization.

That we should be laboring under so dangerous an anachronism, when the Constitution so wisely left us free to choose, is, to say the least, a misfortune. It is to be hoped that this matter will not be overlooked by those who are preparing to face the difficulties of a constitutional amendment in order to change the date of the inauguration, simply for the convenience of a pageant. C. R. Fish.

Madison, Wis., January 13, 1906.

SLOVENLY SPEAKING OF ENGLISH.

To the Editor of The Nation:

Sir: The synopsis of Prof. Blackburn's recent address to the Central Division of the Modern Language Association of America, as given in your issue of January 11, encourages me to write to you on the same theme—the deterioration of spoken English in the United States.

A generation ago, the children of carefully educated parents were diligently corrected in their every-day speech; slang phrases, errors of construction, mispronunciations, indistinct enunciation, nasal intonation and shrill pitch, as fast as they were brought into the family circle from outside contact or from the speech of servants, were rooted out swiftly and effectually. Our heritage from Chaucer, that "well of English undefyled," early became a sacred possession, to be handed on to the next generation as clear and wholesome as it had come to us. Our pride in our old New England ancestry made it imperative for us to keep our tongues uncontaminated by the speech of the vulgar. How is it, that, with such training, such

holy traditions of duty and dignity, we stand powerless or struggle hopelessly against the tidal wave of coarse, slovenly, low-bred language, which is swallowing up our children in its flood? Must we see the dear English of former days swept under to destruction? Or is it possible we are in the wrong? Are we "too particular?"

Professor Blackburn's suggestions by way of remedy are good, except in one provision: yet that one is all. Where shall we find the teachers, who "may do much" to restore to our children their lost inheritance? Not in Chicago's schools. Here, I can assure him, he will find dozens of schools in which not one teacher is capable of setting an example of pure and beautiful speech. Let him visit, also, our great high schools, with their marble wainscoting, tiled floors, improved fire-escapes, generously equipped gymnasium and laboratories worthy of the best colleges; he will find in eacb perhaps one or two noble women, bred back in old New England, who are really fit to carry the torch of enlightenment to—fifteen hundred students! A scant half-dozen more, men and women, use the best quality of Western speech; we are thankful for them. But the count has not reached ten righteous ones.

I appeal to the *Nation:* How is the case in New England itself? Some of us are sending our sons and daughters East to college, hoping thus to repair in some measure the damage done by sheer force of numbers in this huge, prosperous Philistia. Is our confidence well-placed? Shall we receive them back cleansed, purified?

SARAH WILLARD HIESTAND.

CHICAGO, January 16, 1906.

[Measurably, perhaps, except in the article of *shall* and *will*.—ED. NATION.]

MACAULAY'S NEW ZEALANDER.

TO THE EDITOR OF THE NATION:

SIR: Your review of Mr. Macmillan Brown's 'Samson Agonistes of Milton' and other works, and your reference to him as a new New Zealander, brings Macaulay's famous character to the fore once again. His genesis, so far as I know, has never been fully established, and I submit the following *mémoires pour servir*, trusting they may be utilized in some literary laboratory.

Peter Cunningham claims for Horace Walpole the first suggestion of the New Zealander. In a letter to Sir Horace Mann, dated November 24, 1774, Walpole wrote:

"Don't tell me I am grown old and peevish and supercilious—name the geniuses of 1774, and I submit. The great Augustan age will dawn on the other side of the Atlantic. There will, perhaps, be a Thucydides at Boston, a Xenophon at New York, and, in time, a Virgil at Morocco, and a Newton at Peru. At last, some curious traveller from Lima will visit England and give a description of the ruins of St. Paul's, like the editions of Balbec and Palmyra; but am I not prophesying, contrary to my consummate prudence, and casting horoscopes of empires like Rousseau?" (Walpole's Works, Cunningham's ed., vol. vi., p. 153.)

Here the traveller comes from Peru, and not from New Zealand. In 1780 there was published 'Poems by a Young Nobleman of Distinguished Abilities, lately deceased, describing particularly the State of England and the once flourishing City of London, in a letter from an American Traveller, dated from the Ruinous Portico of St. Paul's in the year 2199, to a friend settled in Boston, the Metropolis of the Western Empire.' The poems were written by Lord Lyttelton, the "wicked Lord Lyttelton," and dated March 21, 1771.

The admirers of Gibbon can make a fairly good case for him as the creator of the New Zealander. The claim would be based on the following:

"If, in the neighborhood of the commercial and literary town of Glasgow, a race of cannibals has really existed, we may contemplate, in the period of the Scottish history, the opposite extremes of savage and civilized life. Such reflections tend to enlarge the circle of our ideas, and to encourage the hope that New Zealand may produce, in some future age, the Hume of the Southern Hemisphere." ('Decline and Fall of the Roman Empire,' Bury's ed., viii., p. 44. The volume was published in 1781.)

The next and last "original source" of the famous passage is the essay in Ranke's 'History of the Popes,' in Sismondi's 'Literature of the South of Europe,' published in 1813:

"Who may say that Europe itself, whither the empire of letters and science has been transported; which sheds so brilliant a light; which forms so correct a judgment of the past, and which compares so well the successive reigns of the literature and manners of antiquity, shall not, in a few ages, become as wild and deserted as the hills of Mauritania, the sands of Egypt, and the valleys of Anatolia? Who may say that in some new land, perhaps in those lofty regions whence the Orinoco and the river of the Amazons have their source, or perhaps in the impregnable fastnesses of New Holland, nations with other manners, other languages, other thoughts, and other religions, shall not arise once more to renew the human race, and to study the past as we have studied it; nations who, hearing with astonishment of our existence, that our knowledge was as extensive as their own, and that we, like themselves, placed our trust in the stability of fame, shall pity our impotent efforts, and recall the names of Newton, of Racine, and of Tasso, as examples of the vain struggles of man to snatch that immortality of glory which fate has refused to bestow." (Vol. I., Roscoe's translation, p. 76.)

The passage has the flowing eloquence of Macaulay himself, and has in it almost every idea that is expressed by the great *Edinburgh Reviewer*. But no matter where he first got his idea, it is now Macaulay's, for,

"Though old the thought,
And oft exprest,
'Tis his at last
Who says it best."

ALFALES YOUNG.

SALT LAKE CITY, January 11, 1906.

Notes.

A. C. McClurg & Co., Chicago, announce that they will issue immediately a new edition of the Baroness von Suttner's famous, almost epoch-making, book, 'Ground Arms!' ('Die Waffen Nieder'), issued by them some years ago, and now out of print. The recent award of the Nobel Peace Prize to the author for the influence her book had in bringing about the Hague Tribunal, has led to inquiries from all quarters for the story. The new edition will be in inexpensive form, and will be ready about the first of February.

A Stockholm correspondent of the *Vossische Zeitung* of Berlin, by the way, expresses surprise that the Nobel awards are constantly becoming smaller. At the first distribution they amounted to 150,782 kronen, but this year they have been reduced to 138,089. The Swedish papers doubt the wisdom of leaving to the Norwegians the determination of the peace prize, as the Storthing, which has control of the matter, might use its power for illegitimate purposes, and the demand is made that the regulations of the Swedish Central Commission be thoroughly revised. The income from the Nobel endowments, according to the latest reports, was 1,378,000 kronen; but the expense of management has been so great that less than one-half of this sum has been distributed in prizes. It is charged that the board recently purchased a building to be used solely for the Fund and its work at a cost of 100,000 kronen in excess of what it had been offered for a few months previously.

A posthumous work of the late Henry Demarest Lloyd, entitled 'Man, the Social Creator,' will be published in March by Doubleday, Page & Co.

Henry Holt & Co. will shortly have ready 'Rahab,' a poetic drama, by Richard Burton, and 'Immigration, and its Effect upon the United States,' by Prescott F. Hall, first of a series to be denominated "American Public Problems."

A quite different series is announced by Harper & Bros., the "Mark Twain Library of Humor," edited by Mr. Clemens himself, who will now show whether such a collection will fare better at his hands than poetry at Emerson's as an anthologist.

'The Way of an Indian,' text and illustrations by Frederic Remington, will be brought out next month by Fox, Duffield & Co.

'The Later Works of Titian' and 'The Pre-Raphaelite Brotherhood' will be the next addition to Newnes's pictorial "Art Library," which bears the American imprint of Frederick Warne & Co.

Houghton, Mifflin & Co. announce a limited edition of Franklin's Autobiography, printed under the direction of Mr. Bruce Rogers, and illustrated with famous portraits in photogravure.

A new historical romance by Henryk Sienkiewicz, 'On the Field of Glory,' is being published by Little, Brown & Co.

A 'Deutsches Liederbuch für Amerikanische Studenten,' words and music, compiled by Prof. A. R. Hohlfeld of the University of Wisconsin, is in the press of D. C. Heath & Co.

Macmillan Co. will issue immediately Tennyson's 'In Memoriam' with the poet's own explanatory notes.

The Oxford University Press (H. Frowde) is about to issue 'Scenes from Old Playbooks,' arranged for schools and youthful readers, as an introduction to Shakspere, by Percy Simpson, the only notes being stage notes, and these lavishly supplied, together with a glossary.

According to a report in the *Globus* a collection of Russian popular fables is being made in Siberia under the direction of W. F. Bulgakoff, who is to edit the work and carry it through the press. The materials are being carefully collected, those engaged in the work being directed to give only the fables reported by recognized raconteurs, to report them in the original peasant dialects, and to note correctly the

exact localities where these fables are current.

The time of annuals is upon us, and a welcome awaits the current 'Whitaker's Peerage' (tenth year) and 'Whitaker's Almanack' (thirty-eighth year) for 1906 (London: J. Whitaker & Sons). The editors of the "directory of titled persons" speak of the unabated flow of promotions, requiring as much space as the mention of new honors. They have fixed, in their alphabetical arrangement of compound names like Leveson-Gower and Naylor-Leland, upon the practice of entry by the second name, but with cross-references. We may remind our readers that unusual pronunciations are indicated, as in the case of the first of the above instances; also, that a necrology, abbreviations, and modes of addressing persons of title are part of the regular apparatus of 'Whitaker's Peerage.' The 'Almanack' needs fewer words. Its preëminence corresponds with its age and familiarity. The present issue revives a directory of the towns and counties of England and Wales, and (Americau tourists may take notice) enlarges its article on British health and holiday resorts.

We have also on our table the second issue of the 'Exporters' Cyclopædia,' "containing full and authentic information relative to shipments for every country in the world" (New York: Exporters' Cyclopædia Co.), with its index of countries and ports, its list of countries reached by routes from Atlantic and Gulf ports, etc.; the seventh issue of the 'Architects' Directory and Specification Index' (W. T. Comstock), with its list of architects, and (a new feature) of the Building Departments of various cities, with their personnel; the twentieth issue of the 'American Annual of Photography,' copiously illustrated; and finally (we have been tardy with this) the seventh issue of 'The Medical Directory of New York, New Jersey, and Connecticut,' published by the New York State Medical Association of this city. It embraces no fewer than 15,472 names.

The fifth issue of Miss Florence V. Levy's 'American Art Annual' offers the usual encyclopædic features—complete lists of artists, sales, prices, and the like; and this year registers for the first time the rapidly growing municipal art societies, and even the cities that contain architectural monuments of some importance. Something like twenty illustrations, chosen mostly from prize pictures and important mural paintings of the year, are a solace for the hard-pressed journalist who must constantly use this excellent manual for severer purposes of reference. It is published by the American Art Annual (Incorporated) at No. 20 West Thirty-fourth Street.

From the Clarendon Press (Henry Frowde) we have received two small but interesting volumes of Wordsworthiana. The first, 'Wordsworth's Literary Criticism,' contains practically all of his prose writing of a critical nature, his prefaces, his essay upon epitaphs, certain familiar letters touching on literary matters, and his "opinions expressed in conversation with his nephew and biographer." The selections are interesting, as showing a subtlety as well as a shrewdness of critical faculty. Read consecutively, they convey a peculiar impression of independence, fresh air, and wholesomeness.

The second volume is a reprint of a manuscript volume of 'Poems and Extracts chosen by William Wordsworth for an album presented to Lady Mary Lowther, Christmas, 1819.' The bulk of the pieces are by Wordsworth's favorite, Anne, Countess of Winchelsea, better known to her true lovers as "Ardelia"; but twenty-three other poets are represented, ranging from Webster to William Mickle, and from Shakspere to Lætitia Pilkington. Diverse as the sources are, the poems are homogeneous in a certain intensity of moral inspiration; and in their choice and arrangement a very sensitive taste is displayed. Wordsworth's introductory sonnet does not greatly overpraise them:

> "Genuine crystals, pure as those that pave
> The azure brooks where Dian joys to lave
> Her spotless limbs."

The past year witnessed the completion of the great labor undertaken in 1900 by Prof. Attilio Pagliani, librarian of the University of Genoa, in his 'Catalogo Generale della Libreria Italiana dall' anno 1847 a tutto il 1899' (Milan: Associazione Tipografica-Libraria Italiana; New York: Lemcke & Buechner). This list of works published in the peninsula during the past half-century is as unpretentious as it is meritorious. It furnishes, as we have often pointed out, an interesting series of judgments by the Italian public of the writers of other nations. In the concluding instalments (Parts 32, 33), for example, we observe the overwhelming popularity of Jules Verne—still active—as shown in two pages of titles of his translated works; even Virgil fills no more than two and a half; Zola needs less than one. On the other hand, Uhland, as a whole, has been neglected since 1847 by the translators. Wordsworth has had not one; the only Wordsworth in the 'Catalogo' is Christopher. Cardinal Wiseman still excites a living interest. The strength of the Vasari revival is noteworthy. Seven pages are given up to anonymous lives (*Vita*).

The Munich *Allgemeine Zeitung* states that none of the smaller nationalities of Europe is so zealous and systematic in its efforts to develop and strengthen an independent literature as are the Finns. Amid great difficulties and by tireless energy and industry a Finnish literature has been created which is constantly growing and attaining ever higher reaches of culture. The rich contents of this literature can be best seen from a publication of the Finnish Literature Society, called the Fifth Supplementary Volume, and edited by Vallfried Vasenius, which contains, in 473 pages, an alphabetical and systematic account of all the works published in Finnish between 1896 and 1900. Much of this is naturally translations, and in consequence the translators are given in a special rubric; but the original Finnish literature still makes a very commendable showing.

One of the most flourishing of the learned societies in the Netherlands is the Friesch Genootschap of Leeuwarden. The seventy-sixth report of this body (J. R. Miedema & Co.) shows how rich have been recent accessions to its library and museum—the latter probably one of the best in Europe for the study of the Continental peoples making up the English nation. The characteristic feature of the landscape in Friesland, Groningen, and Drenthe, apart from the *hunebedden*, or "giants' graves," made of boulders, gathered and arranged by human labor, are the *terpen*. These are mounds of clay reared by primitive man for refuge from the floods. Until the days of agricultural chemistry, they were looked upon by the farmer and landowner much as warts and pimples are upon the face. In recent days, scientifically educated cultivators cut them down and sell the fertilizing clay and loam to enrich the adjacent poor and sandy soil. Besides the dime or guilder a load for the stuff sold as fertilizer, the antiquarians discover rich trover. Below the modern surface débris or picnic fragments or animal shards, the spade throws out mediæval relics, and in the lower strata Roman remains of art or use, while in the depths are the stone combs or bone needles of our primitive fathers and mothers. The richest portion of the Frisian Society's report for 1905 tells of the trophies for the museum won from the *terpen*, all older than the ninth or tenth century, in silver, bronze, wood, bone, and earthenware. The gem of the varied collection is a Roman image of Fortune holding in her left hand a horn of plenty. The right arm and hand are perfect, but what she held has been lost. The sclerotica of the eye is of white metal, and the aspect of her countenance seems as lifelike as are the loveliness of her figure and the grace of her drapery. A half-moon is set on her diadem. Two Roman oil flasks were found in the same *terp*. Other articles of metal, such as knives and fibulæ, of Roman origin, ornaments of the Merovingian period, and not a few weapons of the bronze age of 600 B. C., grace the collection of 1905.

The current transactions of the German Asiatic Society of Japan are strong on subjects pertaining to the inner life of the Japanese. Mr. F. Theil gives a digest of the Collection of Old Customs published some years ago in Tokio, which treats of the affairs of the Court of the Shogun and Samurai in Yedo during the eighteenth century—palace and temple architecture, colors of old armor, pictures of costume and dress materials, all amply illustrating, and with much detail, the etiquette of nobles and gentry, from birth to burial. Rev. H. Haas gives the history of, and analyzes into its elements, the Zen, or Contemplative School of Buddhist sects, which in their three great forms have so profoundly and permanently influenced not only the men of thought, but of action, in Japan, since the ninth century. Capt. Schinzingen writes, with graphic illustration also, of Bows and Arrows in Japan. Dr. Oskar Löw shows that by the application of the sulphates and chlorides of manganese to chalky and magnesium soils the crops have in many cases been increased more than one hundred per cent. A paper on the deep-sea fauna of the Sagami coast is by Mr. F. Doflein. Japanese wedding customs (with a bibliography) are discussed under eleven heads by Rev. Martin Ostwald. From "preliminary conditions for a happy marriage" to the after-wedding calls and "recompense of the Go-between" the subject is luminously treated. The Society is in a very flourishing condition.

The recent celebration of the first centennial of the birth of Hans Christian Andersen has caused his native city, Odense, to buy the house in which he was born and to convert it into an Audersen Museum. The work of collecting the materials and

arranging them properly has been entrusted to a local pedagogue, Magister Brix. An exceptionally good collection has already been secured, especially from Copenhagen, and again from the houses of Collin and Malchior, with which Andersen was so intimately connected. A large section consists of letters, manuscripts, portraits, etc. The management publishes the request for contributions to the museum, and hopes to secure not a little from outside of Denmark—from Germany and more particularly from Weimar, where Andersen so often visited.

Prof. Ettore Pais, whose troubles in connection with the Naples Museum have been chronicled in these columns, writes to a correspondent in America that, by a royal decree of last month, he has been appointed to make investigations and journeys for the preparation of an historical and monumental geography of ancient Italy. This must be regarded in the light of some compensation for his dismissal from the Museum. Professor Pais is to retain his professorship at Naples University, but will reside at Rome. During his vacations he plans to revisit America (which he regards as his second home), and lecture here.

The completion of the Nile-Red Sea Railway, which will be formally opened by Lord Cromer at Port Sudan on Saturday, January 27, marks an important stage in the development of Central Africa. Progress in the Sudan since the overthrow of the dervishes has been slow, mainly because of its remoteness from the markets of the world. Khartum is 2,500 miles distant from Alexandria, and foreign freight is transshipped three times before its reaches its destination. Now this place has a direct railway communication of only about 500 miles to the sea, and there can be little doubt that in a few years the Anglo-Egyptian Sudan provinces will export largely of cotton, wheat, rubber, and ebony. The railway leaves the Nile at the junction of the Atbara, and reaches the sea at Port Sudan, 30 miles north of Suakin. It is now proposed to construct another railway due south from this point to Kassala, which will open up a rich country on the frontier of Abyssinia.

The liquor traffic on the West Coast of Africa, now that slavery is abolished, is the worst of the evils that contact with the outer world has inflicted on the natives. But the conditions in Lagos, at least, have so far improved that the capital of the colony is conspicuous for the sobriety of its inhabitants. Lord Lansdowne, in an answer to a memorial signed by the Duke of Westminster, the Bishop of London and other prominent men, recently declared that the total arrests for drunkenness in Lagos, a well-policed town of 40,000 inhabitants and the principal shipping port of the West Coast, during the last three years were 90, or a yearly average of .75 per 1,000. In England the convictions for drunkenness are stated to be 12.60 per 1,000 in seaports and 6.37 in London. As a matter of fact, the consumption of spirits in the colony is not more than one-eighth of what is consumed by some of the nations of Europe. Lord Lansdowne adds that he proposed some months ago to the Belgian Government that a conference of the Powers should be held next summer to consider the revision of the Liquor Traffic Convention of 1899.

The Baltimore Association for the Promotion of the University Education of Women offers a fellowship of $500 for the year 1906-1907 available for study at an American or European university. As a rule this fellowship is awarded to candidates who have done one or two years of graduate work, preference being given to women from Maryland and the South. Blank forms of application, returnable before April 7, 1906, may be obtained from Miss McLane, 1101 N. Charles Street, or from any member of the Committee on Award.

—To trace the wanderings of Ulysses in fairyland seems to have a rare fascination for men of letters who are strictly neither philologists nor archæologists. Only a few years ago an Englishman published an elaborate argument to prove that Trapani, on the northwest coast of Sicily, was the home of Nausicaa, and further that this charming princess was herself the author of the Odyssey. Two and three years ago, as our readers may remember, a learned Frenchman published in two large and sumptuously illustrated volumes a brilliant discussion of Ulysses's wanderings, in support of his thesis that the Odyssey is only a translation into Greek poetry of the sailing directions of Phœnician mariners. Incidentally, M. Bérard identified Calypso's island, the "navel of the sea," with an islet at the foot of Monkey Mountain, opposite Gibraltar, and placed the home of Nausicaa on the west shore of Corfù. Now another Frenchman, M. Champault ('Phéniciens et Grecs en l'Italie d'après l'Odyssée,' Paris: Leroux), identifies Nausicaa's home, Scheria, with Ischia, at the entrance to the bay of Naples. The process is simple. *Scheria* is declared to be the Greek transcription of Phœnician *I-schra*, 'black,' applied to the island as volcanic; this became *Iscla*, the early documentary form of Ischia. This name seems to have disappeared from view for sixteen centuries after Homer, the author admits, but he thinks it to have been preserved as an obscure local name, to reappear in mediæval times. The stream is admitted to be too small for the bath of Nausicaa and her maids, but these may have bathed in the sea near by. No springs are found on the rock where M. Champault places the palace, but cisterns are there which the poet may have glorified into flowing fountains. Nausicaa's car could not have climbed the citadel, but the poet may have added the convenience of a road to enhance the comfort of the palace. The chief argument for the identification of the site, however, is derived from a "combination." The shipwrecked Ulysses, after escaping from Charybdis, was driven by the waves for nine or ten days, and then reached Calypso's Island; this period is said to have been the Phœnician estimate of the time needed for the voyage by the southern route from the Straits of Messina to those of Gibraltar, and our author places Calypso's home on Gibraltar itself. Now, on his return to Greece, Ulysses on his raft sails west for seventeen days before he sights Scheria, and this time, according to our author, is exactly sufficient to bring a vessel by the northern shore of the Mediterranean from Gibraltar to the bay of Naples, and so to Ischia.

—M. Champault believes that Ischia was the seat of the most important Phœnician colony in the western Mediterranean, and that the Homeric story of the reception of the shipwrecked Ulysses by Nausicaa and the Phœnicians is only a "transparent allegory" for the reception of a colony from Eretria and Chalcis by the earlier Phœnician settlement on Ischia. In fact, "the poem of the return of Ulysses was born on Ischia"; it was an "occasional poem" by a Greek bard, celebrating the hospitality with which his countrymen had been received. Homer was, in truth, the Phæacian bard Demodocus. Scylla, Circe, Polyphemus, and the Læstrygonians are not marvels or supernatural to one who has learned to understand the poet's "conventional anthropomorphism." The goddesses represent queens, and these queens stand for colonies. M. Champault agrees with M. Bérard in his fine contempt for ordinary classical philologists, and expresses this contempt by adopting some interpretations which, by philological standards, are clearly wrong. He follows him also in his general method, and uses much of his material, although as a rule he reaches different conclusions. He criticises him for paying too much attention to topography, and himself gives more space to arguments supplied by social science. We regret to say that in this interesting book of more than six hundred pages, with many acute and suggestive observations, no conclusion of any importance is established.

—Dr. Emil Reich's 'Select Documents Illustrating Mediæval and Modern History' (London: P. S. King & Co.) differs somewhat from the common type of source-book, or, rather, from two varieties. Occasionally an editor gives the text of his document in the original form, even if that form be mediæval Latin, and furnishes for less advanced students either a glossary or a series of notes, or both. This is what Stubbs did in the 'Select Charters.' More frequently, however, the editor of a source-book translates his documents with a view to making them easy reading for beginners. Dr. Reich has neither translated his texts nor furnished them with an apparatus of notes. At the close of his book he has printed what he calls an "Index and Glossary," but as a glossary this contribution is most exiguous. Drawing from a considerable range of languages, he has printed his treaties, bulls, letters, etc., in their original form (save for a good many contractions), placing before each a few remarks regarding the document as a whole and a short bibliographical note. By way of justification for the method he has adopted, Dr. Reich says in his introduction: "Had all the documents been given in English, not only would the task of the compiler have been infinitely greater, but he would also have seriously damaged the value of the book." To support the last statement it is pointed out that the meaning of terms such as *terra*, *dominus*, *colonus*, *ingenuus*, and *servus* varies constantly in different countries and at different times. Even men like "Prof. Maitland in England, Below in Germany, or Del Giudice in Italy, have repeatedly expressed their inability to render adequately the true sense of a given term in a mediæval document." The pieces which Dr. Reich has brought together are

well chosen, and it was well worth while to put so many important texts into a single volume, but we hardly think that the reason just adduced is sufficient to excuse an editor from the task of adding notes, where so many are really needed to elucidate for most readers the more obscure or essential portions of the document. Speaking broadly, Dr. Reich seems to have shown more skill in his choice of both subjects and illustrations than care in the manner of presenting his valuable materials. That the name of Prof. Morse Stephens should more than once be spelled with a hyphen, and that the 'Narrative and Critical History of America' should be credited to "M. Winsor" need not be called damning facts, but in other respects it would not be impossible to show how more pains might advantageously have been taken. By way of outlining the arrangement of contents, we may say that the book falls into nineteen parts. First come international treaties, church history, and general institutions of the Middle Ages, occupying altogether about two-fifths of the volume. The rest of the space is devoted to the following States: the Byzantine Empire, the Holy Roman Empire, the Italian cities, France, England, Germany, Holland, Austria, Bohemia, Hungary, Poland, Turkey, Russia, and America. As we have said before, good judgment has been shown in the work of selection, and for this reason the book will be found a very convenient repertory of sources.

—Dr. Gottfried Zedler presents, in the new volume of the *Veröffentlichungen* of the Gutenberg-Gesellschaft, a detailed study of the Catholicon of 1460, and the other smaller works printed with the same type. It is the first systematic investigation of the typography of this work, and stands worthily by the side of Dziatzko's and Schwenke's similar studies of the 36- and 42-line Bibles. Schwenke had, in his investigations of the latter work, come to conclusions which led him to disclaim Gutenberg as the printer of the Catholicon. He based his opinion entirely on technical grounds, dismissing with a word the testimony of the famous colophon. Zedler had already, in his 'Gutenberg-Forschungen' (1901), pointed out that the mere comparison of a couple of isolated details of typographical technique did not suffice to determine the question; at that time, however, he based his dissent exclusively on the colophon. A closer study of the typography of the book, and a comparison of it with that of other early productions of the Mainz presses, have confirmed him in his view. He finds here the same watchful care as in the case of the 42-line Bible, the same striving to imitate the current handwriting, only that the printer has used an entirely different pattern. What the inventor of typographical printing aimed at was to create something that could take the place of manuscript, and he would naturally be bent on making his types resemble handwriting as much as possible, and as appropriately as possible. In the Bible types he would imitate the large and complicated system of writing used by the monkish scribes in missals and other huge works for church use; similarly, he would make the type for Johannes Balbus's grammar and glossary resemble the more ordinary book script in vogue at the time. Other printers would not have the same delicate feeling for the manuscript tradition. No comparison is here made between the various productions of the early presses in Mainz; the space at the author's disposal made some retrenchment necessary. This part of his investigations will appear separately in a short time. A textual comparison of the productions of the Bechtermünze press in Eltville, also belonging to this investigation, has in the meantime been printed in the December number of the *Zentralblatt für Bibliothekswesen*.

—The close connection of Gutenberg's types with the handwriting of his time is shown in detail in Heinrich Wallau's address, "Gutenberg: Techniker und Künstler," which was delivered at the annual meeting of the Gutenberg-Gesellschaft last summer, and printed in its fourth annual report. Herr Wallau lays stress on the fact that, while much of Gutenberg's labor undoubtedly had to do with the perfecting of ink and press, the chief matter of his invention was, technically, movable types, and, æsthetically, "the imitation of the handwritten letter forms, *i. e.*, their transformation into forms which on the one hand could be multiplied by casting, on the other hand strive to attain the highly developed beauty of manuscript." This address, short as it is, is of great importance because it brings together within small compass the results of the latest investigations into the technique of the earliest productions of the printing-press. Wallau here takes the opportunity to refute emphatically the notion that the invention of printing owed anything to the earlier art of woodcutting. There can be no connection between these two arts. Gutenberg was a goldsmith, metal-worker, and stone-carver; his invention was technically based on work in metal.

—That much edited and somewhat overestimated "classic," Buffon's so-called 'Discours sur le Style,' continues to exercise the ingenuity of petty annotators in the French lycées. One marvels how they see room for successive improvement in the critical apparatus on so brief and simple an address. Yet the best edition seems to be the latest, by René Nollet (Paris: Hachette), a tasteful booklet provided with the inevitable introduction and notes, and with an appendix. The appendix is useful: it shows Buffon's characteristic method of revision in the 'Discours' itself; it contains also a fragment by the same author 'Sur l'Art d'écrire,' as well as extracts from other addresses bearing upon his theory of composition. Either this edition or that by Félix Hémon (Paris: Delagrave, 1894) ought to supplant in this country the antiquated French edition by Rondelet mentioned in Gayley and Scott's 'Literary Criticism,' and hence familiar by name at least to many of our teachers. Current opinion here on the exact form of Buffon's celebrated epigram, "'The style is the man,'" likewise needs renovation. In spite of G. H. Lewes in 'The Principles of Success,' etc., and Messrs. Gayley and Scott in the work just cited, and Mr. Shepherd in *Modern Language Notes* for June, 1890, we may, following M. Nollet's text and comment (p. 22), still quote Buffon as saying, 'Le style est l'homme même," and regard the form, "Le style est *de* l'homme même," which appeared in certain of the earlier versions of his 'Discours,' as a variant, but not the preferable reading.

AN ENGLISH "SET" OF THE LAST GENERATION.

Mrs. Brookfield and her Circle. By Charles and Frances Brookfield. In two volumes. Vol. I., 1809-1847; Vol. II., 1848-1874. Charles Scribner's Sons. 1905.

This is one of those gossiping "books about people," which have of late years become so frequent on both sides of the Atlantic. Such books generally take the form of "Reminiscences," in which men or women over sixty years of age recount to a public apparently incapable of satiety the incidents of their earlier life, seasoned with anecdotes bearing on the more notable persons whom they may have seen in the street, or met in a drawing-room, or perhaps even spoken to. The thing is beginning to be overdone, because the authors have often had no special opportunities for knowing really interesting people, or because they lack the faculty of describing and making real to us the interesting people whom they did know. Still, it is plain that the book clubs like such books, for the supply does not diminish. In the present instance the form is not that of personal recollections, but of a collection of letters (with bits of diary interspersed) written to (or in some cases by) the hero and heroine of the book, who form the centre of the "circle." This is better than the reminiscential method, because we get into touch with persons who do still possess some interest for our own time; and the letters frequently contain gossip about other figures of their generation who are more interesting than the letter-writers themselves. It is really in these letters that the claim of the book to be here noticed lies, for the connecting paragraphs and the descriptions of the principal personages which come from the pens of the two compilers, are done in a somewhat loose and careless fashion, which shows itself even in the numerous misprints or misspellings of proper names we encounter.

Mrs. Brookfield, whose name is given to the book, was Jane Octavia Elton, eighth daughter of Sir Charles Elton of Clevedon Court, Somersetshire. His sister Julia married Henry Hallam, the historian, and became the mother of Tennyson's bosom friend, Arthur Henry Hallam, whose early death gave cause for the group of poems which all the world knows as 'In Memoriam.' Miss Elton was thus Arthur Hallam's first cousin, and intimate with most of those, many of them afterwards eminent, who were bound together by their affection for him. In 1841 she married William Henry Brookfield, the son of a lawyer practising at Sheffield in Yorkshire. He had been the fellow-student at Trinity College, Cambridge, of a number of brilliant men, who formed, perhaps, the most remarkable group that had ever lived together as friends at any English university. Preëminent among them were Alfred Tennyson, then already famous among his contemporaries, and W. M. Thackeray, whose reputation came later. But there were also James Spedding, the best of all those who have written on Bacon; Richard Trench, afterwards Archbishop

of Dublin; Monckton Milnes, the poet and politician, who became Lord Houghton; A. W. Kinglake, the historian of the Crimean war; Franklin and Edmund Lushington, one a poet, the other one of the first Greek scholars and Egyptologists of his day; Charles Buller, whose early death cut short a public career of wonderful promise; Henry Taylor, the author of 'Philip van Artevelde'; W. H. Thompson, afterwards Master of Trinity College; and G. S. Venables, one of the leading journalists and most conspicuous social figures in the London of forty years ago—not to mention others whose names are now less familiar. Brookfield, who had considerable wit and a dramatic gift which would have made his fortune on the stage, was a favorite with the rest of the set; and the set continued to hold together through later life. Its last surviving members passed away in the closing years of the nineteenth century. Brookfield himself died in 1874 and his wife in 1894.

It is chiefly with this group of men that these two volumes are concerned. But some of their friends also come in, and chief among them Thomas Carlyle and his wife, our curiosity regarding whom, notwithstanding (and perhaps all the more because of) all that Froude and others have written, remains unexhausted. There appears also Lady Ashburton, of whom so much is said in the letters of both the Carlyles, and who was the most brilliant hostess of her time. Here is a passage about the two ladies:

"Lady Ashburton this Christmas consulted Mrs. Brookfield as to what would be most useful to give to Mrs. Carlyle as a gift from the Christmas tree (this fashion was just appearing in 1855), and a silk dress was finally decided upon; but this present seems to have angered Mrs. C. She would not take it; she vowed she was being insulted, and Lady Ashburton was at last forced to seek her in her room and assure her with tears in her eyes she had not meant to offend. . . . Mrs. Carlyle was very slight, neat, erect in figure, animated in expression, with very good eyes and teeth, but with no pretension to beauty. She used to remain in her room during the early part of the day while her husband took his walks, accompanied by his admirers. When she did appear, she was always taken especial care of by Lady Ashburton, and she expected and was conceded a certain prominence amongst the many other visitors of more or less distinction in that delightful house. Mrs. Carlyle's instinct was always to take the lead at the Grange [Lady A.'s house]. This was not easy, for the grandeur and brilliancy of our hostess, who, according to Mrs. Twistleton, 'scattered pearls and diamonds whenever she spoke,' made her the first interest and attraction to all around her. In conversation, clever and amusing as she often was, Mrs. Carlyle had the fatal propensity of telling her stories at extraordinary length. With her Scotch accent and her perseverance in finishing off every detail, those who were not devotees but merely acquaintances sometimes longed for an abridgment, and perhaps also to have their own turn in the conversation" (vol. ii., pp. 426-7).

There are some good letters of Mrs. Carlyle's, and some characteristic anecdotes about her husband. Here is one, in which two other distinguished persons figure:

"A. Tennyson arrived at Lady Asbburton's, and next day came the first copy of his new poem, 'Maud,' which he promised to read aloud to us. But Carlyle, who was among the guests, could not endure to listen to any one reading aloud—not even to Alfred Tennyson. C. was accustomed to take an early walk daily and to be accompanied by an appreciative companion. What was to be done? All the visitors presumably wished to listen to Tennyson's delightful reading. Lord and Lady Ashburton were kept waiting; chairs had been arranged in a quiet sitting-room; the visitors were taking their places. Alfred was ready. So was Carlyle—in the hall—waiting for a companion in his walk and evidently determined not to stir without one. It was an anxious moment. Each of us wondered which would volunteer, like Quintus Curtius, to leap into the gulf. At length Mr. Goldwin Smith generously stepped forward and joined the Philosopher, and then William [Brookfield] joined them both, while the rest of us remained enthralled to listen to the new words of the Poet" (vol. ii., p. 429).

Another of Samuel Rogers (in his old age):

"Rogers, though now drawing to the end of a long and well-amused life, was still to be seen out, and found pleasure in receiving the selected few at his own house. Mrs. Brookfield was standing by him one day, when a lady came up and said, 'You remember me, Mr. Rogers?' 'Perfectly,' he replied at once. 'Who could ever forget you?' Then in an equally loud voice he asked Mrs. Brookfield, 'Who is she? Never met her before in my life'" (vol. ii., p. 499).

Of Thackeray, who was a devoted friend to both the Brookfields:

"He could not help pouring out about him unmeasured draughts of splendid affection, giving copious return for all that was bestowed upon him. Singularly simple, humble in matters concerning himself, he paid high homage to his intimates, and fitted them all most generously with laurels and with halos. And he often went out of his way to soothe wounds given to them by rougher spirits, always assuming this to be but part of his daily task. He was in all things grand and stanch and faithful. When, not long before his end, he was asked by his daughter which of his friends he had loved the most, he answered, 'Why, dear old Fitz [Edward FitzGerald], to be sure—and Brookfield'" (vol. ii., p. 503).

A dictum of a great lady of her time regarding Mrs. Norton, once a famous figure in English society, reads: "The late Duchess of Sutherland said of Mrs. Norton, 'She is so nice, what a pity she is not quite nice, for if she were quite nice, she would be so *very* nice'" (vol. ii., p. 525). And here is an extract from a letter of Thackeray's, with a reference to another, now nearly forgotten, novelist:

"I haven't the courage to pay the postage for so much rubbish. Isn't it curious that a gentleman [himself] of such expensive habits should have this meanness about paper and postage? The best is that I have spent three francs in cab hire, hunting for the man who was to carry my two-franc letter. The follies of men are ceaseless, even of comic authors who make it their business to laugh at the follies of all the rest of the world. . . . Harrison Ainsworth is here [in Paris]; we dined next each other at the 3 Frères yesterday, and rather fraternized. He showed a friendly disposition, I thought, and a desire to forgive me my success, but, beyond a good-humored acquiescence in his good will, I don't care" (vol. ii., p. 296).

Here is one of Mr. Brookfield's experiences as an Inspector of Schools:

"To one little boy, whom I asked, like the rest, to write impromptu on his slate about whatever object I might mention to him, I had, perhaps somewhat imprudently, proposhed a race horse. He gave up his slate inscribed with very good wrlting and spelling, as follows:

" 'The race horse is a noble animal, used very cruel by gentlemen. Races are very bad places. None but wicked people know anything about races. The last Derby was won by Mr. I'Anson's Blinkbonny, a beautiful filly by Melbourne, rising four. The odds were twenty to one against her; thirty started, and she won only by a neck.'

"I handed this dissertation to one of the school managers. He returned it to me with a perplexed look, saying: 'I am very sorry, indeed, for this. He was always a very good little boy *till now*.' I found that he was the son of an honest and industrious groom; and, notwithstanding the ominous 'till now,' the intelligent and amiable appearance of the child, and the good character I heard of him, give color to the hope that he may yet escape the treadmill" (vol. ii., pp. 464-5).

It is only by thus sampling the anecdotes in this book that a notion of its contents can be conveyed. It is much too long; all the things really worth telling and all the good letters could have been easily put into one of the volumes. Still, for those who enjoy gossip, there is a good deal of entertainment. Mr. Brookfield, who is commemorated in a little poem of Tennyson's, was a man of remarkable social gifts. Fate rather than choice made him a clergyman, and he won some distinction as a preacher. Nature had meant him to be an actor or reciter. His recitations of Shakspere were admirable. His wife was tall and handsome, with a soothing voice and a winning manner. Though her novels show no marked ability and are now quite forgotten, her intelligence and her pleasant ways fitted her to be what is called "a social centre," and gained for her the devotion of many friends. Besides those already named, Barry Cornwall (Mr. Procter), whose verses were once very popular, and his able wife and his poetic daughter Adelaide, Charles Dickens, Lady Duff Gordon, Charles Collins, Richard Doyle, Samuel Wilberforce (then Bishop of Oxford), William Vernon Harcourt, Lord Lyttelton, and Mrs. Cameron, who made a new departure (then much talked of) in amateur photography, flit through these pages. There are sidelights on the fashions of thinking and talking in the "middle Victorian" period; and now and then some anecdote, too slight for a formal biography, brings out a trait in the character of a person whose memory deserves to survive.

THE BODY OF OTTOMAN LAW.

Corps de Droit Ottoman: Recuell des Codes, Lois, Réglements, Ordonnances et Actes les plus importants du Droit Intérieur, et d'Études sur le Droit Coutumier de l'Empire Ottoman. Par George Young, 2me Secrétaire de l'Ambassade d'Angleterre. Vols. I., II., III.: pp. xxiv., 346, vi., 412, iv., 416. Oxford: Clarendon Press; New York: H. Frowde. 1905.

These volumes form the first half of a great corpus of Ottoman law, to he completed with a second part of four more. It will then be one of the most unique books in existence: a necessary hand-book for the daily use of every merchant or resident in the Levant; a source of the first rank for the historian of modern Turkey; a fund of perpetual enlightenment, entertainment, and astonishment for the scientific student of law; a master-key to a good half of the events, day by day, of the hither East for the publicist; a long-desired sequel and complement of his knowledge of Muslim jurisprudence for the Orientalist; finally, a readable, yet studiable, view of the state of legal and national topsy-turvydom, of bewildered strivings and blind driftings whose like has probably never existed for all to whom nothing human is alien, and who can

pass through the phrases of law to the sense of tears and of laughter in human things. The melancholy moralist might find here, too, his prey, even behind formalities, decrees, ceremonials. The inexorable fate which we now call the law of development, traces in these pages inevitable consequences. The Ottoman may struggle, forwards or backwards; the past remains—the fetters he, in contempt and carelessness, himself for himself, forged—and it is unyielding. Out of the simplicity which he would, has arisen a complication which he cannot master; and the contemptuous tolerance of the past avenges itself in the multitudinous restrictions of the present. If, without apparent scheme or plan, the English Constitution and the English law have muddled through to a practical perfection, the same things in Turkey, moving with a similar aimlessness, have become only thrice confounded. And the reason is plain enough. In the one case, a single idea, living and germinating, has developed in steady adaptation to the facts of life; in the other, a slothful and short-sighted dualism has reigned from the first. Therein, it is true, lies the picturesqueness of this book. Against the happiness of the land without history can be balanced the unhappiness of one whose law-books are too full of color and interest. Or the case is even worse. History may be effaced and forgotten, but law speaks for the conflicts of the present.

And yet, how monistic—if it be lawful to apply the terms of philosophy to ordinary life—was the first conception. The people of Muhammad, as it formed itself in the minds of the first Muslim rulers and jurists, was to be an elaborate unity. State and Church, theology and law, conduct and morals, were to be but phases of the life of an undivided organism. As Muhammad had been ruler, judge, creed-maker, and pattern for his people, so that people was to be for itself in the centuries to come. A New England township, in its uncorrupted days, is the nearest Western parallel, but incomplete enough. How the pursuit of that ideal slackened and failed, this is not the place to tell. The ideal itself remained and forms the democratic consciousness of Islam to this day, but rival dynasties and conflicting theologians and lawyers shattered its actuality within less than a generation. One element, however, survived and rounded itself to technical perfection—in part, of the most intimate life of the people; and, in part, a dream of unreconciled churchmen. This was the system of law—in its essence a system of canon law, because theological in basis and covering all the sides of life. The sources of that system of law were five: the Qur'an; the usage of Muhammad—*i. e.*, what he said and did as judge, as theologian, or simply as a man, in the ordinary events and vicissitudes of life; analogy from these; the agreement of the Muslim people. With these was built up an elaborate structure forming a complete guide to a man's duty under all contingencies, to God, to other men, and to himself, and including, in consequence, what we should call codes of civil and criminal law. The presupposition—one never fulfilled, except partially as regards Arabia—was that the Muslim land and state would contain only Muslims. The only account taken of non-Muslims is in the sections on the sacred war against them. The contrast is complete. All conduct for Muslims was regulated, and nothing applied to non-Muslims except the sword or tribute.

Such a system could not but break down. An elaborately deduced code of law and usage suited to the tribes of Arabia could not be made to apply to conditions stretching from the Atlantic to the Pacific, from Russia to southern India and central Africa. Nor could relations with non-Muslims, either subjects or travellers or resident aliens, be summed for long under the sword or tribute. So while this system maintained its position as a code of canon law, and regulated such matters as marriage, divorce, and inheritance, it was everywhere pushed aside in matters of the world between man and man, and still more between Muslim and non-Muslim. There remained ecclesiastical courts applying its rules and decisions in those limited spheres, but beside them there grew up secular courts, following the usage of each country—its common law—and the will of each ruler. This met one side of the difficulty; but the non-Muslims still remained. These consisted, in great part, of communities whose "differentia" was religion, organized more or less closely under heads—Patriarchs, Bishops, Chief Rabbis, etc.—administering through ecclesiastical courts. It was very simple, then, to give these bodies praetical autonomy, and make them responsible for their own affairs through their religious organizations. The analogy of the Muslim ecclesiastical courts lay near, and, above all, it saved the state a great deal of trouble. In this way, too, they were kept outside of the Muslim ring-fence, were not recognized as co-subjects or citizens, as the case might be, and yet were kept quiet. That it perpetuated the schism in the body of the population, and made impossible the development of a uniform state with equal standing, rights, and duties for all, was evidently never considered. Yet when the courts of canon law were pushed aside, and those of local usage took their place, a great unifying opportunity had been lost.

So it was, too, with foreign merchants and resident aliens. With the tendency of the Oriental to accept guilds, unions, and fraternities as the unit of government, resident merchants were left to the control of their own business organizations, and, in case of trouble between a Muslim and a foreign merchant, the head of the organization or the ambassador of the foreign Power would be called into court as an assessor. The European Powers have known how to limit this extra-territoriality down to the person and household of the ambassador, but the Muslim East has extended it practically to cover all foreigners, and thus has aided the slothfulness of the Muslim courts. The Western Powers, too, whenever they found how careless Muslims were in guarding their own sovereignty, executed treaties putting this usage on a fixed basis. These were (and are) the Capitulations, which have come to form a part of the organic law of all Muslim States. By these, the sovereignty and freedom of action of the native governments are limited to a degree hardly credible. The native non-Muslim communities may have their rights by usage roughly invaded at any time, but the foreign settlements are in other case. They are protected by these formal treaties, and the European missions unite to resist encroachment.

All these courts, then, and systems of law exist in Turkey and are described in the present treatise. The scope and privileges of the canon law and its courts have been wofully reduced, but these institutions themselves continue to exist in complete organization. To them the pious look as rendering the only true Muslim law; with the Mahdi and the millennium which he will bring, these will again rule supreme.

Next come the normal courts of the land, administering a system of law modelled on the Code Napoléon and based on Turkish usage and the decrees of the sovereign. Next, the different privileged communities—a bewildering array of ecclesiastical organizations, giving a view of the religious history of the nearer East and of the Balkans since the Christian era—have each a constitution, internal autonomy and courts for the rendering of justice among their members. For foreigners, further, there are their consular courts, possessing absolute authority, even of calling Turkish witnesses, based on the Capitulations. But questions must also arise between Turks and foreigners, and between peoples of differing nationalities. For these there are the mixed tribunals, or international courts. The further complications in the Turkish courts themselves, civil, criminal and commercial, are due to successive attempts at reform. There are also some local autonomies and jurisdictions. The principality of Samos, for example, administers a code fundamentally Byzantine, with the right of local legislation. Curiously enough, its courts contest the claim of extra-territoriality which the Ottoman Empire, its suzerain, is compelled to admit. The Lebanon, too, has a similar practical autonomy.

Naturally, all this means much friction. The Porte is perfectly conscious that the situation produced by the Capitulations is an impossible one for any self-respecting State. Even the little isle of Samos will not have it. In consequence, with every reform, whether paper or real, the attempt is made to limit the jurisdiction of the consular or the mixed courts. Then the embassies come into play, and at intervals in these volumes we read "les Missions n'ayant pas accepté" whatever it may be. Europe, of course, does not mind this; any method of keeping Turkey in order is good. But when the English Government in Egypt meets the same situation, and discovers that the very necessary policing of certain districts in Cairo is made impossible, and that it may need three consuls and their staffs to legally raid a joint in the Cairene Tenderloin, the effects of mediæval treaties on municipal and other government have another aspect. It is true that the goose and the gander here are of very different flavor and toughness.

For the method on which Mr. Young has carried out his gigantic task, there can be little but praise. On his own ground—the Ottoman codes as they are to-day, with their history—he is probably untouchable. His Arabic is less certain, and his views of the early history of the canon law. The identification (ii. 161) of the rites of the Mandæans with those "de la secte protestante anglaise des 'Baptists'" is possibly a joke. But the mass of materials which he has here collected, the intelligence and historical sense with which he has introduced and annotated them, the laborious care which he has given to their completeness, introducing documents bearing dates up to the

beginning of last year, and indicating exactly the present state of contested questions, and the accuracy with which the enormous hurden of the proof-reading has been carried out, have earned for him the gratitude tenfold of all interested in Turkish affairs. For details there can be no space here, hut one remark may not be out of place before passing from this atmosphere of multitudinous law. The trouhle about the excellent lahors of Mr. Young is that they deal with a paper subject, and that the realities have therewith only a somewhat detached connection. To halance these heautiful systems and to approximate to the actual facts, the student should carefully combine with these volumes such a book as 'Turkey in Europe' by "Odysseus." The process will he almost as violent and the result almost as queer as in the article on Chinese metaphysics, ahout which Mr. Pickwick was told; hut they will be decidedly more informing, and will really approximate to the state of the case.

ECHOES OF THE WAR IN THE EAST.

The Reshaping of the Far East. By B. L. Putnam Weale. 2 vols. Macmillan Co. 1905.

A Staff-Officer's Scrap-Book during the Russo-Japanese War. By Lieut.-Gen. Sir Ian Hamilton. London: Arnold. 1905.

The War in the Far East. By the Military Correspondent of the [London] *Times*, Dutton. 1905.

The Russo-Japanese war is fast becoming past politics and assuming historical shape. A review of the three interesting books before us may serve to hring out certain salient facts, now fairly estahlished, as to both the military and the political side of the great event whose close was marked, not so very many weeks ago, hy the treaty of Portsmouth.

First, as to things military. The reasons for the Japanese successes may now he summed up pretty accurately, and so can the undouhted weaknesses that their army developed. The greatest factor of victory was the morale of the rank and file, though even that has been exaggerated. Before the hattle of the Yalu there was, as Sir Ian Hamilton hrings out, just a shadow of a doubt among many of the Japanese whether, when it came to the crisis, the European would not, after all, prove more than the equal of the Asiatic. Such is the power of prestige. After the Yalu there was a visihle increase of confidence in the troops, yet even then it is a gross exaggeration to think of the Japanese as having displayed a quality for which the fit epithet is fanaticism. The Guards division with Kuroki's army was brought to a dead stop at Yoshirei hy the Siherian riflemen under circumstances that would have been perfectly normal in European warfare; and, without in any way detracting from the splendid Japanese infantry, it does not appear that the losses they were prepared to encounter were notahly dissimilar to those faced at Waterloo or Eylau, at Antletam or Chickamauga, at Vionville or Plevna. There was a high morale, with a fierce fighting spirit hased on the intense national hatred of Russia, and this was turned to account hy a remarkable staff organizatlon.

And here we come to the second great factor. An old and generally accepted saying is that councils of war never fight; the Japanese have heen the exception to prove the rule. Under the instruction of Major-Gen. Meckel of the German army, they have since 1885 constructed a great staff corps resembling that of Germany in many particulars, and in none more strikingly than in the unity of impulse with which it acts. It was this unity of impulse, combined with the national fervor of the moment, that inspired the methodical and somewhat slow offensive of the Japanese armies. Every forward move, every battle, was apparently the result of extensive deliherations, and never the spontaneous flash of judgment springing from the brain of one commander. Not that the generals lacked ahility. Oyama's cool if deliherate judgment, his perfect courage, deserve the largest recognition. But essentially the war was conducted hy a staff and not hy a general-in-chief, and Japan will have to see to it that in the future her armies do not meet a great general, and that her staff is kept right up to its present remarkable level of professional skill, combined with patriotic enthusiasm.

In respect of her artillery and cavalry, Japan was apparently less formidahle. The artillery was inferlor to that of the Russians and hadly horsed. Only the superior skill of officers and men, and the many captures of the battlefield, enahled the Japanese to hold their own in this respect. As to the cavalry, the least said the better. Their numhers were ridiculously small, and no attempt appears to have been made to employ them in masses. Let the Japanese staff turn away from the defective German cavalry traditions, and study Lee's move from the Wilderness to Spottsylvania, or Grant's from Petershurg to Appomattox, and they will find there a leaf of the art of war they are as yet unacquainted with.

We have less reliahle information from the Russian side. It is clear that the officers failed while the men maintained the traditions of the Russian soldier. The infantry fought hravely and stuhhornly, and some corps, especially the Siberian rifle regiments, fought well. The artillery was excellent as to material, and far from deficient in skill. As with the Japanese, hut for different reasons, the cavalry was the greatest disappointment. Numhers were not wanting, hut stupidity reigned supreme. The wretched exhibition of the Cossacks is especially noteworthy, and it appears doubtful if the horseman of the steppes can, in the nature of things, he taught the lesson that the Boer never requires to learn. With the Boer the horse is accessory to the rifle; with the Cossack the horse is everything. The exposure of the Cossack fiction must he a great relief to the German General Staff.

The successes of Japan have profoundly stirred the East and especially China. A remarkahly interesting chapter in Mr. Weale's hook gives figures and facts as to Chinese army reorganization that will surprise most readers. They leave it perfectly clear that China is already in possession of a modern army large enough to protect her from the attack of any Power operating over sea, and that it is hardly more than a matter of months hefore she will be able to match the numhers of Japan or Russia in Mantchuria. That is a remarkable fact, and it is clear that no statesman with the slightest foresight should attempt from this day to treat China except as an equal Power. In a very few years she may be the greatest Power in the world.

It is on this last point that Mr. Weale's excellent hook is perhaps least satisfactory. He has nothing hut contempt for the traditional benevolence of our policy toward China, he has no words of reprohation too strong for the nationalities that have of late energetically attempted to force their way into the trade zone so long monopolized hy England; yet when it comes to England's opium trade, his indignation falls, and all he has to say is that the Chinese laborer works hard enough to throw off the ill effects of the drug. In other words, Mr. Weale approaches the Chinese question from a stricter insular point of view. Yet his hook may he hightly recommended. He knows China well. He discusses the relations of China, Korea, Japan, and Russia in readahle and instructive fashion, and his illustrations are both numerous and uncommonly good. Three chapters of his second volume deal with the war, and are much below his standard, owing to an obvious lack of knowledge of things milltary. His account of the circumstances attending the sinking of the *Variag* is especially misleading, and his strictures on Admiral Uriu unmerited. That officer was not relieved of the command of the Fourth Squadron, and he led it in the actions agalnst the Vladivostok fleet and in the battle of Tsushima. Mr. Weale is addicted to Gallicisms such as "functioning," "complots," and "triplicate"—this last for the Triple Alliance. Some of his forecasts have been falsified since he sent his hook to the press. But, all reserves made, there is nothing better on the Far Eastern question as it stands at this moment.

The London *Times* published some reports on the war, as it progressed, that could hardly he surpassed for excellence. They are now in part pieced together and published as a history of the war. In this latter guise they are not satisfactory, and prove once more, if proof were needed, that newspaper reports will never make good history. A comparison of the *Times's* account of the hattle of the Yalu with that given hy Sir Ian Hamilton, for example, demonstrates the gulf that separates the truth from what can he at the hest only the approximate truth. It must, however, be added that, even as it is, this hook contains many remarks on matters of strategy and military science that are of permanent value.

Of these three books, by far the most attractive for its personal or literary quality is that of Sir Ian Hamilton. It represents the English intellect at its best, for here we find a highly trained specialist who is also a man of wide education, a soldier, a man of the world, and a man of culture in one. Sir Ian evidently became highly popular at the Japanese headquarters, and ohtained much technical information not generally accessihle. His 'Scrap-Book' is not only valuahle for this reason, but delightful for the personality of the writer. He views questions of war and peace on a very hroad and original hasis, as witness the following quotation:

"Why—there is material in the north of India and in Nepaul sufficient and fit, under good leadership, to shake the artificial society of Europe to its foundations if once it dares tamper with that militarism which now alone supplies it with any higher ideal than money and the luxury which that

money can purchase. . . . It is heroism, self-sacrifice, and chivalry which redeem war and build up national character. What play do these heroic qualities find in the ignoble struggle between nations for commercial supremacy, with stock exchanges and wheat pits for their battle-fields?"

In conclusion, let us not err in the direction of underestimating the great change that is now fast spreading over Asia. It may be that time will justify the underlying assumption of such English publicists as Mr. Weale, Dr. Morrison, and Mr. Ireland, and prove that the Asiatic is inherently inferior to the Caucasian. But it will certainly be wiser for the present that we should support their criticisms of American policy with equanimity and assume that China is capable of attaining within a very few years a rank of equality among the nations. When that equality comes, it will be better that China should associate our country with a policy of good will than with one of bullying.

Borgia: A Period Play. London: A. H. Bullen. 1905.

The splendid and tragic history of the House of Borgia has been a constant attraction to dramatists and novelists, but has never received satisfactory treatment until now. One reason is that, until the appearance of the remarkable drama before us, it has never been attempted in a sufficiently serious spirit. Lee thought only of filling the theatre, and Cossa of satirising the Temporal Power. The picture of unredeemed villany which these dramatists exhibit, even had it been in accordance with the truth of history, is inconsistent with the conflict of passions and the interfusion of light and shade required by the canons of tragedy. Fortunately for the artist, no less than for the historian, modern investigation, without bereaving the Borgias of their picturesqueness, has brought them within the sphere of ordinary humanity, and shown them not as exceptional portents, but as actual representatives of the general spirit of their epoch. This has been thoroughly comprehended by the anonymous author of our tragedy, in whose pages the Renaissance lives again, with all the beauty of artistic environment and freedom of thought and action that renders it so attractive on one side, and all the political and social immorality that makes it sinister and repulsive on the other.

Another difficulty in the way of the Borgian dramatist is that of finding a passage in the family history which, however suitable for stage treatment, is not too limited and partial for historical painting on an ample scale. The murder of the Duke of Gandia and the fall of Cæsar Borgia are highly dramatic incidents, but the former is a mere episode, and the latter a mere catastrophe. The author of "Borgia" has avoided this difficulty by (as designedly expressed by the phrase "A Period Play") renouncing all idea of stage representation and constructing the drama on the model of Shakspere's historical plays, dealing with a series of events extending over ten years, and so arranged as to include all the most picturesque incidents in the chronicles of the House of Borgia. It is, consequently, as an English critic has remarked, rather a pageant than a tragedy, but a most gorgeous pageant. From the Pope down to the waterman, every class of contemporary Italian society is represented, and each personage appears in appropriate costume and glowing with the rich color of the time. The illusion is perfect; we seem to be living in the Renaissance epoch, seeing with its eyes and judging with its brain. The effect is even aided by some phrases and modes of thinking which in a modern writer might appear odd and crude, but are quite in keeping with the spirit of the period.

The general effect is to make Alexander and his children more intelligible and nearer to ordinary humanity than historians have until recently been able to represent them. This is not attained without some prejudice to the eloquence which the theme might appear to invite. There are few set speeches. The characters speak briefly and to the point, but their diction is suffused with imagination, ever and anon bursting forth in a flash of poetry, such as this instantaneous photograph of the

> "Still Spanish boy,
> His black hair shining and his ears with edges
> Of the clear ruddiness of pomegranates,
> The light of sunset is so shed on him."

Or in a weighty saying like this:

> "History
> Is life and death, and never resurrection."

Or in Michelotto's pithy simile on Cæsar's apparent torpor ere, in Macaulay's phrase, "he caught his treacherous condottieri in one snare and crushed them at one blow":

> "Such air a dragon sleeps in."

Or in Alexander's exultation at the triumph of his son:

> "Our Duke knelt down;
> He took the emblem, took the hand and kissed
> The foot of Christ's vicegerent; then together
> We stood erect and he advanced; for once
> He went before me—that was joy!—before me,
> The Rose in his right hand, the hovering Dove
> On his heretta, with its fretted rays,
> A nimbus round him from the monster pearls,
> And he before me like a star of heaven!"

His inordinate family affection, passionate to the verge of insanity, is the dominant feature of Alexander's character throughout. It has abundant historical justification, but the very skill and thoroughness with which it is worked out inevitably falsify the representation of the character as a whole. Of the doting parent we have a masterly portrait; of the statesman and ruler, unfathomable in craft and endowed with tremendous driving power, we hardly obtain a glimpse. It remains for some future novelist or dramatist to depict the Spanish Pope on this side, and to solve the difficult problem of representing utter worthlessness and unscrupulousness in policy allied with exuberant geniality in private life. Neither Cæsar nor Lucretia is a complex character. Save for the hinted imputation of offences on Lucrezia's part, of which impartial history acquits her, both appear to be represented as they actually were. Cæsar's callous egotism makes an effective foil to his father's fondness; while his energy and audacity extort involuntary admiration. The subordination of political to private interests obscures the divine irony of Cæsar's career. He thought himself most astute when, after employing his agents to commit all necessary crimes, he requited them with the scaffold; and never suspected that Providence was dealing in the same manner with himself.

Arizona Sketches. By Joseph A. Munk, M.D. New York: The Grafton Press. 1905.

This is a good example of a new type of book in which the literary element is subordinate to the pictorial. Nearly every other page contains two excellent reproductions of well-made kodak pictures, and Dr. Munk evidently follows the example of lecturers who, having a collection of slides, accommodate their address to the exigencies of their illustrations, for he describes only those phases of Arizona life and scenery of which he has been able to snap off good pictures. These, however, are so excellent and well selected (so far as they go) that a glance through his pages will convey a better and truer impression of cattle ranching, of the grotesque vegetation of the Arizona desert, of the famous Meteoric Mountain and its supposed crater, and of some of Arizona's characteristic scenery, than most writers can convey with the pen. But the book gives in no sense, nor does it profess to impart, a complete description of Arizona and its products—it omits, for instance, all reference to its most prominent industry, namely, mining; nor does it pictorially display the rapid growth of some of its new mining towns. These are the best and most striking features of the progress of the Southwest.

Arizona, in popular estimation, is the land of romance, rowdyism, and exaggeration, and in the past it deserved its bad character. As farming drove cattle-ranching westward from Texas and through New Mexico into Arizona, that most picturesque but reckless group of frontiersmen, the Texas cowboys, and the Indians, between them, some twenty years ago, made life strenuous, if not precarious, in many parts of the Territory. But the frontier has been pushed into the Pacific, and beyond—into the Philippines, in fact—and Arizona and New Mexico now claim that their good behavior, as well as their industrial position, entitles them to be accepted into the great family of States. It does seem, in fact, an anomaly that Arizona, which contributes 250,000,000 pounds of such an important national staple as copper, or about one third of what all the mines of the Union turn out, should be excluded from a vote in Congress, and therefore be under the same disability, viz., taxation without representation, as justified our forefathers in throwing some chests of tea overboard in Boston harbor and fighting for their independence. At the same time, Arizona thinks that her population and her wealth entitle her to separate Statehood. Her territory extends nearly 400 miles from east to west, and over 400 miles from north to south, giving her an area of 112,920 square miles; and to tack her on to New Mexico, with an equal area, would make such an unwieldy State that many Arizonians would prefer to remain under the disadvantages and advantages of Territorial government until deemed big enough and good enough to be endowed with the responsibility of Statehood, rather than to be harnessed to an adjacent section, the great bulk of whose population is alien in race and language. Arizona is undoubtedly growing to the requisite stature, for, though there seems to be no standard

by which full national manhood is to be measured, judging by the puny size of Idaho, Wyoming, and Nevada when they were made States, she will soon reach that maturity of political, social, and commercial life which will compel parties in Congress to heed the force of public opinion despite the exigencies of national party politics.

Twenty years ago her population was so small that the census enumerator was known to remain as a guest at a ranch for a full fortnight in order to add an expected baby to his list. The census of 1900 gave 92,903 as her white population, with 26,480 Indians, and a small number of negroes and Asiatics; but so rapid has been her growth since, that in 1902 the Territorial enumeration put the population at 140,000, and it is now approaching 200,000. The largest increase has been in the southern counties, where copper mining has been most actively prosecuted. Within the last five years the copper mining towns of Bisbee, Clifton, Morenci, and Globe have more than doubled in population, and within that period the railroad junction town of Douglas has grown from a single tent to a well-built city of 6,000 inhabitants, with large stores, brick schoolhouses, banks, mercantile establishments, and metallurgical works and manufactories. The mining, metallurgical, railroad, and mercantile interests of a single firm in the Southwest give employment to 10,000 workmen.

Agriculture has not kept pace with mining, but, under the stimulus of the irrigation schemes now being carried forward under the Reclamation Act, known as the Hansbrough-Newland measure, large tracts of desert, which thirst for water to become gardens of perennial fertility, will, under Arizona sunshine, be peopled. The Southwest is already furnished with abundant railroad facilities. Two transcontinental roads link it with the East and the West, and about 1,000 miles of north-and-south lines and branches give access to every important industrial point. In fact, Arizona has more miles of railroad per head of population than any other section of the Union. Cheap fuel and cheap transportation have for years reduced this, the most arid section of the whole American desert, from being the haunt of the Indian and the cowboy, into an active centre of business and industrial activity. The Indian remains, but he has submitted to the inevitable, and, whether it is congenial or not to his hereditary instincts, is peaceably and successfully cultivating the land, and works on the railroads and about the mines for better day's pay than the white laborer of the East receives.

Tibet and Turkestan: A Journey through Old Lands and a Study of New Conditions. By Oscar Terry Crosby, F.R.G.S. G. P. Putnam's Sons. 1905.

The English authors of the books heretofore treating of the British occupation of Lhasa have reluctantly admitted that there was little to excuse the invasion of Tibet. Not being hampered by office or national prejudice, our countryman, Mr. Crosby, in his stirring tale of adventure and still more stirring record of wrongs, tears off with a pitiless hand the thinly decent covering which "political necessity" threw over the Lhasa affair, and exposes that affair in its naked simplicity. Substantially the same view is taken by the author as was taken in the *Nation's* review of Landor's 'Opening of Tibet'; only, in addition, Mr. Crosby seeks to show that fear of a Russian invasion of India from the North is a bugbear. The deeds done in the British raid were without warrant in actual conditions or in any topographically justified apprehension. There remains no excuse for the Younghusband expedition.

The way is paved for this frank expression of conviction by a description of Mr. Curtis's attempt to reach Lhasa from the west, and his failure to do so; by our author's inference that the Russians could not do so; and by his study of geographical data. These parts of the book are sandwiched together rather oddly. Tibet precedes Turkestan in the title, because Tibet is the chief subject of Mr. Crosby's regard. But in the book itself Turkestan precedes Tibet; then come a history of Tibet and the denunciation of the British movement; after this a short history of Turkestan; and then, as appendices, a geographical paper and (British) state papers relative to Tibet.

It is unfortunate that the arraignment of the Younghusband expedition is weakened by extraneous matter calculated to invite adverse criticism. As a prophet in respect of Russia, Mr. Crosby risks his reputation by the statement (p. 19) that he "can see nothing to suggest destruction of the essential unity of that Empire," and that "local irritations in Finland, Poland, and the Caucasus, however justified they may be, cannot go to the length of establishing independent Governments in an age which demands consolidation." As to the latter statement, time will show; it is at least a daring prediction. But there is not much essential unity left in Russia. Not many will agree with the author's induction that irrigation is liable to be a curse to America, because of the "enervating facility and the great vulnerability of irrigation systems," as shown, for example, in Bengal. There is hope for us, he thinks, in some mitigating circumstances, though climate does not seem to be one of them! But, from an argumentative point of view, the greatest defect in the author's Tibetan thesis is that he undermines it by asserting his adherence to that philosophy which teaches indifference to right and wrong. After Mr. Crosby has gone out of his way to proclaim his belief in the universal Will which impartially urges the wolf to slay and the lamb to bleat objection thereto, and has identified the wolf with England and the lamb with Tibet, how can he expect to convince his readers that the wolf deserves rebuke? That same philosophy gave moral strength to all the thugs of India, where it was taught two thousand years ago. If the British wolf kills the Tibetan lamb, it is only the red slayer thinking along the lines laid out for it. Why should Mr. Crosby lament as "pathetic" and "harrowing" any processes of the universal unmoral Will? To him, "unjust" and "cruel" are the words of those foolish people who believe in the freedom of the will. As he says himself: "If, then, the British power, ruthless, shall complete its destruction and construction in Tibet, then the ruthless act shall have demonstrated its necessity in the general scheme of things. Why preach about it, then?" Why, indeed! But we are persuaded that Mr. Crosby's morality is deeper than his philosophy, though he would have us believe that he preaches as the lamb bleats.

The author secured one of the rare manuscripts found in the sands of Turkestan, and has presented it to the Congressional Library. Its authenticity appears to be vouched for. Mr. Crosby has also laid scientists under obligation by correcting M. Grenard's faulty estimate of the number of monks in Tibet (not half a million, but 175,000). His defence of the polyandry of a polyandrous people is clever, and has much of truth. At least it explains very well the reason for the system in the nature of things Tibetan. We have left no space to speak of the venturesome trip with M. Anginieur through Turkestan and a corner of Tibet over mountains 18,000 feet high; but the narrative will well repay perusal. Trifling lapses are a lacuna on page 141; "kharma" for karma, pages 169, 173; and "Musselmen" (p. 109); but "talismans" has escaped the dire corruption of analogy. Curiously enough, Hoernle, the name of the well-known Sanskrit scholar whom the author visited in Oxford, appears five times as "Hoerule"!

The Life of Reason; or, The Phases of Human Progress. By George Santayana. Vol. iii., Reason in Religion. Scribners. 1905. Pp. ix., 279.

In this, the third, volume of his *magnum opus*, Professor Santayana contemplates the wide field of the religious consciousness, and applies thereto the principles laid down in the first two volumes. It thus claims consideration in a wider context, though it is certainly not lacking either in interest or in intelligibleness for those unacquainted with the earlier volumes. Indeed, while as brilliant in form and as stimulating in point of view as they, the present book succeeds in throwing fresh light, and is a real help in estimating the ultimate drift of Mr. Santayana's philosophy. For, sooth to say, the outcome of the earlier volumes was a trifle enigmatic. They seemed at many points to fall in with the drift of the most recent philosophy. They were distinctly "pragmatic" in their view of truth, and scornfully critical of the metaphysical bogies of absolutist philosophers. Their rejection of rationalistic intellectualism went so far as to come perilously near to avowed irrationalism, and their insistence on the chaos of instincts in which all rational activity was rooted, seemed to import into their very title a touch of satire. Nevertheless, there ran through the whole a thread of naturalism of a distinctly older pattern, which provoked unanswered questions as to its relation to Mr. Santayana's more novel views.

Now the present volume makes it fairly clear that this naturalism is really the deeper current in his thinking. Mr. Santayana is, of course, much too modern and too well versed in psychology not to conceive the phenomena of the religious life as primarily psychological in their significance, and therefore not to feel bound to bestow on them serious and sympathetic consideration; but at the critical turning-points a

deep-seated prejudice in favor of naturalism always weights his scales. He cannot conceive that religious experience can in any way acquire cognitive value. He is firmly convinced that "the idea that religion contains a literal and not a symbolic representation of truth and life is simply an impossible idea" (p. 98). He argues that successful religion can only pass into "contemplation, ideality, poetry," and that to conceive it as really efficacious is to degrade it into an art of exploiting the world (p. 42-3). That the exploiting of the world is necessarily degrading is also an unargued prejudice (though not a naturalistic one), hard to combine with a pragmatist theory of knowledge.

It is not surprising, therefore, that Mr. Santayana will not hear of any future life in any literal sense; but that his attitude proceeds not from reason, but from bias, appears clearly from his remarks on the value of what seems empirical evidence of survival. While not venturing to deny (p. 230) that there may be "a residuum of clairvoyance and telepathy and an occasional abnormal obedience of matter to mind" in these psychical phenomena, he is quite sure that it indicates nothing but lower faculties unworthy of investigation, and argues in a pathetically *à priori* and dialectical fashion about the possibilities of "disembodied life." It is clear that here again his naturalism strikes deeper than his empiricism.

After thus brusquely sweeping away the ordinary foundations of man's religious life, Mr. Santayana proceeds, however, to seek the spiritual consolations of "reason" in a somewhat surprising way. For the word seems to have subtly changed its hue. Hitherto it had figured merely as the faculty of distilling satisfactions out of a naturally irrational whirl of things. Now it suddenly becomes a faculty of soaring, Platonically, to the ideal goal of all life, of uplifting one's self onto the plane of pure intellect, one and divine and timeless, of "gravitating towards a fixed object called truth," and thereby resting in an unearthly "contemplation of things not implicating time in their structure," and so becoming "ideally immortal" (pp. 263-273). In short, Mr. Santayana revives for our edification all the hyperboles of Aristotle's "theoretic life," and produces a similar feeling of incongruity. Despite his protests against mysticism, the whole doctrine seems highly mystical, rather than reasonable. It is hard to see how an ideal goal which does not exist, can unite a plurality of minds between which it would form a "gulf" if it did exist (p. 264). Nor does it seem a plausible mode of escaping from the flux of cosmic changes that we should concentrate our attention upon abstractions from which we have ourselves excluded the thought of their time-relations. For are not our ideal objects just as transient as those who think them? To palm off the "eternity" of an abstraction on a bewildered public is an old philosophic trick; but one would not have expected Mr. Santayana to descend to so paltry and manifest a *tour de force*. The congruity of Mr. Santayana's conclusions with his premises, then, is not as clear as might be desired, and few, perhaps, will care to share his precise combination of abnegation and enthusiasm. But his work remains of high interest as a human document, and abounds in memorable sayings and incitements to quotation.

The Long Day: The Story of a New York Working Girl, as told by Herself. The Century Co. 1905.

This is the recorded experience of a worker in good faith, who came from the country with neither money nor friends, and with only such business training as had been furnished by a short period of teaching in a country school. No story of amateur trifling is hers. She must have worked or starved, and in her dreadful experiences she touched the very bottom of the industrial question. As a narrative the book is powerful and absorbing, and it must have, we should suppose, a definite value as a contribution to the great question, How can the working girl be helped out of her depressing and depraving surroundings? The closing chapter, which supplements the record with suggestions of some palliative measures, contains the kernel of the matter. Of these indicated remedies one is the building of a system of hotels after the plan of the Mills Hotels for men. Another, a greater interest on the part of the church in the workwoman's welfare, not from an eleemosynary standpoint, but as an adjuster of her social and economic difficulties:

"A live and progressive church—a church imbued with the Christian spirit in the broadest and most liberal interpretation of the term—can do for us, and do it quickly and at once, more than all the College Settlements and all the trades unions that can be organized within the next ten years could hope to do. And for this reason: the church has all the machinery ready, set up, and waiting only for the proper hand to put it in motion to this great end," *i. e.*, the solution of the problem "affecting the economic condition of the wage-earning woman."

Personally, the author has great faith in trades unions, and would like to see them organized by women. She has observed, on the other hand, that workwomen so far are blind to the benefits of organization, and she adds with naïve candor that "it has not yet been proved that the trades union, carried to its logical conclusion, is likely to be a panacea for the industrial woes of the sex which does favor and support it." This idea, therefore, she reluctantly sets aside to await growth. Meantime, to the church she appeals, and to the workwoman's hotel she points for help. In relation to the hotels, she insists that they be business enterprises, with neither religion nor "coercive morality" as their watchword. More to the point, she avers, is a parlor. "The number of young girls who go wrong in a great city like this for want of the various necessities of a parlor must make the angels in heaven weep."

In the working girl's lack of equipment she finds the main cause of her difficulties; not only—not even chiefly—in her lack of technical training, but in her utter ignorance of how to work. Not to understand the principles of labor is to dislike work; to dislike it is to fail as a wage-earner; and from the failures come the delinquents and criminals. It was from reading Booker Washington's 'Up from Slavery' that the author of 'The Long Day' awoke to the perception of industrial immaturity as the workingwoman's handicap. In addition she finds her equally ill-prepared to think right, to live right, or to meet the moral crises that waylay her. Yet she sees daylight in some directions, building hopes on the free kindergartens, whose effects are only now beginning to be felt as a factor in the industrial field. She fell in with many who had had public-school teaching for a greater or less time, but found them deplorably weak in two of the "R's." All wrote well; but not one was there "whose knowledge of the simplest rudiments of learning was confident and precise." The only girl whom she met who had had kindergarten training knew how to work, and had learned the secret, as she herself said, "of killing two birds with one stone," and of "makin' of your cocoanut save your muscle." The writer does not unduly generalize from this one instance, yet it is evident that, even without it, she is firm in the belief that intelligence and method will follow kindergarten training. Has she not seen the workers—the baby band "learning the rudimentary principles of work under the blissful delusion that they were at play"? Better books, too, for the working girl she asks for, and better books that they will read—not Shakspere, Ruskin, or Pater, but clean, present-day romance; present-day, because the girls will read no other. Finally, to teach the working girl to work intelligently is to substitute "working" for "being worked." It is to teach her

"to think about herself and all those things which most vitally concern her as a woman and as a wage-earner. And then, you may depend upon it, she will settle the question to please herself, and she will settle it in the right way."

The writer's tone, even when there is most provocation to heat, is conspicuously fair and free from hysteria; eminently broad, sane, and hopeful is her view. But did the Young Women's Christian Association really recommend a boarding-house as one kept by "a lady of very high Christian ideals"? The language does not sound like that business-like purveyor of the working girl's welfare.

With its disclosures, its suggestions, and its hopes, 'The Long Day' is a book that must and will be read. It would not be surprising to find it coloring the counsels of them that sit and devise relief for suffering humanity.

Il Libro dei Viaggi. Principe Baldassare Odescalchi. Rome: Casa Editrice Nazionale. 1905.

These two volumes belong to a series of a dozen books of travel issued by the same house. The descriptions of visits to Palestine, the Argentine Republic, and Constantinople, which have already appeared in the *Nuova Antologia*, are enlarged, and an account of the four weeks spent in America by Prince Odescalchi in September, 1904, as a delegate to the Interparliamentary Peace Congress at St. Louis, is added. His travels were limited to the itinerary hospitably provided by this Government. He "hesitated to yield to the desire to publish an account of this journey," and there is much in these pages to justify that hesitation. Errors like "handsome-cab", "forweler" (four-wheeler, the name he applies to cabs), "bengio" (banjo), "bigst" (biggest), illustrate the difficulties

of English for a nation of phonetic spellers, and, like "St. Louis, the capital of Louisiana," the "Illinois River" for the Potomac, and *"incerlezza"* for *incertezza*, *"hanuo"* for *hanno*, have little excuse. His steamer, entering New York harbor, neared "Cuney-Island" and coasted along "Governors Island, where the custom house is, and Ellis-Island." The small number of steerage passengers was "due to the excitement of a Presidential campaign, which always causes a total suspension of public works." Our author attributes the decay of American shipping to the dearth of American sailors and the high price of labor.

The morning after landing, he wished to engage a *valet de place*. He not only could not hear of one, but not even succeed in making any one understand what a "domesticus di piazza" was, and he followed the democratic advice to make use of the automobiles for "Seeing New York." The feeble and not scrupulously refined jests of the megaphone man, and the extravagant laughter with which they were received, were, with reason, distasteful to him, but they lead him to comment at length upon the American's "childish" fondness for jokes. He writes much about American bad manners, but the case cannot be entirely hopeless since at West Point the interparliamentary visitors were "taken first to the library, because they like to show foreigners their collections of books as a sign of their increasing culture"; and in the reading-rooms both men and women were so absorbed in their books that "none stirred to look at us, although we were representatives of all the Parliaments of Europe, people not to be seen every day in this country." In the Metropolitan Museum the *biga* found near Norcia (the only complete one known) and the frescoes discovered at Bosco Reale lead him to regret the inefficiency of the Italian provisions for preventing such treasures from leaving the country, and to admit having done his utmost to secure these paintings for that Government. He succeeded only in having some small specimens of them given to the museum at Naples. Yet he notes how few Italian paintings are in the collection, and not one of first rank, and how small and unimportant is the collection of Italian porcelains and majolicas. He takes too seriously the invitation of the mayor of Philadelphia: "If any of you should wish to become a citizen of this city, he has only to ask. We will accept him with pleasure." The mayor "thought to honor the Europeans," but "in the past such an offer would have been received as an affront if it had been made to a *civis romanus* like myself."

Throughout his long service in Parliament, Prince Odescalchi has given much attention to Italian emigration, and he visited Argentina to study this subject. More of the agricultural classes, more from Northern Italy, have gone there. Here his compatriots, he says, are considered "undesirable," and therefore he recommends that the tide of emigration should be deflected by Italy to South America, where the newcomers "would meet a better welcome, and, in consequence of racial affinities and the common origin of their speech, would be less at a disadvantage and probably would preserve the impress of the ancient Latin civilization."

It is a welcome sign of changed conditions to find this descendant of the family of Innocent XI. recognizing, in the very broad religious toleration which exists in this country, one of the finest characteristics of our people.

The Autobiography of Samuel Smiles. E. P. Dutton & Co. 1905.

Autobiography has been wittily defined as "that which biography ought to be." There is no more delightful species of literature than a genuine autobiography—that is to say, one in which the writer has nothing to conceal, no appearances to keep up, and in which weaknesses and blunders have a share of the canvas as well as virtues and success. Hence the charm of Alfieri's Autobiography, and of Montaigne, who is so freely autobiographical. And so it sometimes happens that a man whose other writings show no particular indication of genius may, if he will, write a supremely interesting account of himself. Judging from the volume before us, it would seem that the converse also holds true. Dr. Samuel Smiles wrote a number of books in the last fifty years which were singularly successful and meritorious—if large sales be accepted as the test of merit; but his autobiography is a decidedly dull book. He was a shrewd and successful Scotchman, resembling in many ways one of his countrymen who has achieved an immense fortune in this country, and who is not restrained by any false modesty from informing the world that his success is due to the possession of excellent qualities of mind and body. Every other page of this book is devoted to self-glorification over the success of the writer's previous books and their translation into many languages. This sort of elation is perfectly legitimate, but its too frequent expression tends to weariness, and would incline a cynic to suspect that the sales of 'Self-Help' were falling off and required some such stimulant.

As an account of the man Smiles, except in this matter of vanity, the book is quite valueless. Glimpses we get of his views of literature (other than the product of his own pen), as when he says of Ebenezer Elliott, the Corn Law rhymer, that he "gained a reputation as a poet equal to that of the best of his time"; and we may infer absolute self-confidence from the fact that he wrote a 'Guide to America' without considering it necessary to cross the Atlantic. He describes his visits to various countries, but has nothing to say about them that is not better said by Baedeker, and to one who has recently enjoyed Montaigne's 'Journey into Italy,' Dr. Smiles's account seems a veritable *reductio ad absurdum*.

The gospel of success will always be popular among the complacent optimists who are satisfied that everything is for the best in this best of all possible worlds; but there are others.

Poésies de Guillaume IX., Comte de Poitiers. Édition critique. Publiée, avec une introduction, une traduction et des notes, par A. Jeanroy. Toulouse. 1905.

That William of Poitiers was not the first of the trouhadours may be inferred from the relative perfection of his style and versification, as well as from his own boast that he bore the palm at this trade; but of his predecessors we know nothing. We have, then, in this slender volume of sixty-one pages all that has reached us of the verse of the first of that long line of Provençal poets whose music caused the old chronicler Philip Mousquet to say that, when Charles the Great divided his conquered lands among his vassals, he gave Provence to the singers and musicians. These earliest examples of a lyric poetry that has influenced every European literature of importance, are of no small interest, and fortunately M. Jeanroy's French translation makes the reading of them possible to others than special students of Provençal.

The earlier editions of William's poetry by Keller, and by Holland and Keller, are to-day difficult to obtain, and were, moreover, incomplete and uncritical. M. Jeanroy has for the first time given us all of the eleven poems ascribed with reasonable certainty to this poet, with the readings of the various manuscripts. The book is a reprint of an article in the *Annales du Midi* for April, 1905. In addition to a critical text, with notes, the editor offers us a discussion of the language and versification, and seeks to point out, as already perceptible in these poems, the peculiarities of sentiment and expression which characterize the later court poetry. The mystic exaltation of love with which we are familiar in Dante, with the traditional opposition of the disdainful lady and the humble and patient lover, must have already existed, for we find it well developed but a few years later in Bernart of Ventadorn; yet of this we catch but glimpses in the poetry of William. He was no platonic lover, satisfied alone with setting his plaints to music, and the full-blooded passion of his love often finds expression in the sensual and brutal. Instead of worship, we often find a touch of contempt for woman as his inferior. Nevertheless, the germ of the later convention is here, as the germ of the elaborate and artificial versification of a later time is in the comparatively simple forms of his verse.

Those who are interested in William of Poitiers as an historical figure—as the grandfather of Henry's Queen Eleanor and the great-grandfather of Richard the Lion-Hearted—will perhaps be disappointed at finding the discussion confined to William as a poet. The poems themselves, however, throw valuable light on the character of the gay cavalier who led an army of one hundred thousand men into Palestine, and, after its annihilation, if we may believe Oderic Vital, made jesting songs of this ill-starred crusade.

The Boston Transcript says of

Stopford Brooke's On Ten Plays of Shakespeare

"A more delightful volume of criticism it would be hard to find. . . . He approaches his subject wholly from the æsthetic side, and one could scarcely have a more fascinating or more helpful companion with whom to wander through Shakespearian fields. . . . His discrimination is markedly keen. . . . Each is illuminative. . . . Lovers of Shakespeare owe Mr. Brooke a debt of gratitude."

The Argument Against Materialism
Life and Matter
A Criticism of Professor Haeckel's "Riddle of the Universe."
By SIR OLIVER LODGE
Crown 8vo. Net $1.00 (by mail $1.10)

"A fascinating reply to Haeckel's materialistic philosophy of life. . . . There is so much in the pages of this deeply absorbing monograph that it is hard to refrain from recapitulation of the sane, sound arguments presented. Everyone who has read *The Riddle of the Universe* should also read *Life and Matter*. He will not find the latter the more sentimental work, although it preaches the doctrines of idealism; nor will it seem that the Englishman is the less profound scientist."—*Providence Journal.*

The Nation.

NEW YORK, THURSDAY, FEBRUARY 1, 1906.

The Week.

The real debate over the Statehood bill, in corridors and cloakrooms, having lasted ever since Congress convened, the House devoted a day to open discussion, and on Thursday passed the bill. It must have been a day of uncommonly cogent argument, for the net result was that four of the Republicans who opposed the special rule on Wednesday voted for the bill the next day, and five others did not vote at all. This; by the way, reduces the gallant band of thick-and-thin "insurgents," who stuck by their colors through both the tariff and Statehood fights, to only sixteen. The fight is now carried to the Senate, where there will be something more than a few hours of cut-and-dried speechmaking. The outcome is as uncertain as it was last year. The general opinion last autumn was that there was a drift of sentiment favorable to the amalgamation of New Mexico and Arizona, but this impression has been somewhat counteracted by the more than ever vigorous opposition developed in the lower house. There are few disinterested advocates of immediate Statehood for Arizona and New Mexico separately, but there are many who favor the postponement of a final decision until it can be seen how far their promise for the future can be actually realized. Whatever the disposition of the Senate, we trust that Oklahoma and Indian Territory may no longer be kept waiting on the determination of an absolutely unrelated question.

Of Secretary Taft's eleven army bills submitted to Congress, two are especially important, that providing for an army reserve of 50,000 men, and the proposal to "eliminate" officers in order to get rid of the deadwood and provide for a regular flow of promotions. The army reserve plan is a modification of one urged by Secretary Root, which Congress wisely refused to consider, and which called for 100,000 men. The marked decrease in this new measure shows that some doubts as to the practicability of the larger body had arisen. Indeed, it may well be asked whether 50,000 is not beyond the range of possibility. Several years ago Congress authorized the establishment of a list of men qualified for service in the Federal Volunteers, to be made up of resigned officers, members of the militia of the several States, etc. The list is still pitifully small. The rates of pay of the enlisted men in this new reserve are to be graded in accordance with their wages while in the regular army, and they must be ready for ten days' drill every year during an enlistment of five years. Now every one knows that the men who leave the army are largely men who wander; many of them are not worth having in a reserve, and one in ten deserts. It will be no easy matter, therefore, in our judgment, to find 50,000 men under forty years of age who are worthy graduates of the regular army and are willing to join this reserve. Moreover, to keep track of men of this kind will be enormously laborious.

Inadvertence seems to be in the Cabinet what aphasia is in insurance circles. Through inadvertence, Secretary Taft candidly admits, he exceeded his power in making a monetary agreement with the Panama bankers. But he explains that the damage was not great, since a contract made in disregard of law could at any time be broken in disregard of equity. "It may not be fair to the other parties, . . . but it can be done," were his words. Reviewing the transaction, the irregularity of which he freely conceded, he put the blame upon Congress for failing to legislate for the canal strip. The argument was, in effect, If you gentlemen turn a ticklish business over to us without instructions, you must take the chances of our mistakes. We have no wish to judge Secretary Taft harshly, though his defence before the Senate Committee on Finance comes curiously from a trained jurist and one often mentioned for the Chief Justiceship. We wish merely to call attention to the happy-go-lucky fashion in which the great canal enterprise is being conducted. It may be no great matter that a Cabinet officer should innocently overstep his powers; it is a grave matter that Congress and the Executive should be perfectly satisfied with a régime in which this sort of straining of constitutional prerogative is regarded as natural, and even necessary.

Another absent-minded official is Senator Lodge. The other day, in sheer gayety of heart, he had spoken of the Dominican protocol as "the beginning of a great policy." This was said "inadvisedly"; he meant the "continuance" of a policy handed down from the fathers. Having cleared away this misapprehension, he proceeded to reveal to the Senate the limitations of its treaty-making powers. Not theirs to interfere in delicate negotiations; not theirs to question the terms of a treaty until it should please the Executive to lay it before them for ratification. Let them keep within their own powers, and trust Mr. Roosevelt's wisdom until the fulness of treaty-making time. So speaks Mr. Lodge, the strict constructionist, forgetful of a certain Lodge who, in *Scribner's Magazine* for January, 1902, proclaimed the "treaty-making power of the Senate," and vindicated its right to be consulted in advance in all important preliminaries to a treaty. Possibly, this article was written "inadvisedly"; we can conceive reasons for the author's being willing to forget it when no paltry reciprocity treaty with Newfoundland is at issue, but the "continuance" of the routine policy of intervention, bequeathed to us by the founders of the republic. Evidently, the treaty-making power of the Senate is delightfully elastic—comprehensive when you wish to burke a treaty unpopular with your constituents, strictly limited when you wish to support a President "going it alone."

Senator Spooner defends with spirit our limited representation at the Algeciras Conference. "In the long, long reach of time," says the Senator in cosmic purview, "are we to confess that we dare not send delegates to international conferences to protect American interests, because we fear they will not know when to withdraw?" In other words, how are our diplomatists to learn how to get out of bad boxes unless first they get in? How may they practise the modest and useful art of self-effacement unless first they have obtruded themselves? Such an argument takes us back to those early Christians who, to demonstrate their faith, voluntarily exposed themselves to the direst temptations. These experiments as often revealed the frailty of the flesh as the might of the spirit. But, on the point of slipping away adroitly, Mr. Spooner emphasizes the President's capacity for seizing psychological moments:

> "The President of the United States, who hit upon the psychological moment to intervene and bring to an end the deplorable war between Russia and Japan, can be trusted to determine the psychological moment when Ambassador White and his colleague, Minister Gummere, must withdraw from the Moroccan conference in order to save this country from all danger of unfortunate European entanglements, should such a moment come to pass."

Now the crudest intelligence of the most craven American can grasp the evident fact that there is no use in perceiving the psychological moment for withdrawal unless you have something to withdraw. Evidently, if you are to recall your delegates at the instant when the peace of the world wavers in the balance, you must first send them. This explains all.

If Congress ever does order the Treas-

ury Department to put the customs machinery on a business basis and abolish at the same time ports of entry whose expenditures exceed receipts, it will also be destroying one of its annual subjects for discussion. Mr. Brundidge this year has performed the task of procuring the list of such ports for the information of his colleagues. There were fifty-one of them—four more than there were two years ago. There is really a story in every one. Some are seaports of old-time renown, now forgotten and decaying. Some are custom-houses created in preposterous places as the outcome of Congressional log-rolling. Some, like Brazos de Santiago (Brownsville, Tex.), are really only stations for the apprehension of smugglers, and have a value out of all proportion to the revenues they turn in. There are ten ports which, with aggregate expenses during the last fiscal year of $5,160.33, turned in actually not a penny of revenue. While, for the reason already stated, it is not true that every port operated at a loss ought to be closed, and some officer is needed at most of these places, yet this feature of the system of customs collection is a crying absurdity.

Charges of political heresy are said to have been brought against Representative Brownlow, national committeeman from Tennessee; and before the excitement of the Congressional campaign begins, he is likely to receive a formal trial before Chairman Cortelyou. The proceeding itself is unusual, and the line of defence, according to report, is to be more novel still. Mr. Brownlow's free-silver speech in 1896 he justifies by confessing that he merely used the gist of a former speech on the money question by his party's Presidential candidate, McKinley. If anything like a general inquisition is planned, we fear that similar defences would be pretty often heard. What proportion of the Republican laity, even the Republican priesthood, we wonder, subscribes to all the thirty-nine articles of its faith? The poor wretch suspected of Anti-Imperialism, as the thumb-screw is turned, will shriek out the names of the group of regular Republicans, a member of the Ways and Means Committee among them, who voted in the House the other day for a declaration favorable to Philippine independence. The trembling heretic dragged to the stake for his revisionist views is no more guilty than half his brethren, if the truth were but known. And the rack would be broken down before all the dissenters on the canal policy, rate regulation, or ship subsidies were purged of their sins. Neither is it a favorable time for such reformatory action, nor is a Congressman who has "taken more appropriations for his State than any other man" a good choice for the first victim.

The country's great prosperity is eloquently indicated by all the financial weather-signs of the period. Exchanges of bank checks during December in the whole United States, lately compiled and published, afford some astonishing comparisons. They not only run 12 per cent. beyond the previous December maximum of 1904, but are actually double the same month's total as recently as 1898—itself a year of real financial prosperity. Iron consumption, another and even more accurate index of genuine trade activity, similarly surpassed all precedent. December's output exceeded that of the year before by no less than 25 per cent.; that for the whole year 1905 almost exactly doubled the figure of 1898—a rather striking parallel to the testimony of the bank exchanges. Reports of our foreign trade, lately published for December and for last year as a whole, are perhaps less impressive in comparison, but they, too, bear witness to the active industrial movement of the country. December's exports reached unprecedented figures; its imports have been equalled in only five other months of the country's history, and four of those five months fell in 1905. The year itself far surpassed the record both in exported and imported merchandise; its total outward and inward trade ran half a billion dollars beyond 1900, and the fact that the surplus of exports, under such circumstances, was smaller than in that peculiar year is, we should say, a sign of greater economic health. These are the dry statistics of the industrial situation. They are abundantly corroborated by descriptions of the trade situation, coming from every quarter of the country. It is probably true that the United States has at no previous time reached such a level of uniform prosperity.

Notwithstanding Gov. Vardaman's efforts to put an end to mob law in Mississippi, there was an increase in the number of lynchings in that State during 1905—twenty, as against eighteen in 1904. All the victims were negroes, but only two were guilty of the "usual crime." One was murdered by a mob for writing an insulting letter, and another for uttering a threat, while four were murderers and four had attempted to kill. Three had attacked or fired on officers of the law. Sixteen were hanged and four were shot to death; six after being taken from official custody. In one case of rape the mob was composed entirely of colored men, the victim also being colored. Encouraging features of this bad year for law and order were Gov. Vardaman's dispatch of special trains and prompt ordering out of the militia to save prisoners, with the first recorded conviction of a white man, Robert Young, for killing a negro criminal. Young was given a life sentence after conviction by a white jury for having shot a manacled negro when he was on a train bound for the penitentiary. In all probability, Young will be pardoned ere long, but the conviction will none the less have a salutary effect. Moreover, four "prominent citizens" of Hattiesburg have been indicted for participating in a lynching; but the men accused of killing Sheriff Poag of Tate County because he defended a white prisoner, were acquitted after a long and heated trial.

The existing election law in this State does not seem to have a solitary friend willing to speak a good word for it, but its hostile critics are increasing in numbers. The presentment of the Special Grand Jury which has been investigating election cases, reviews the abuses which have been known to exist for many years, but which came into especial prominence at the last election. Not only were the rights of watchers disregarded, but "many disputes arose at the polls by reason of different views as to the proper method of counting disputed ballots." What else could any one expect from a law which provides an indefinite number of alternative methods for doing the same thing, and expresses its intent so dubiously that the Supreme Court itself does not pretend to understand all its provisions? There are really two separate questions involved here. The rights of watchers and the proper registering of their protests can be secured only by having election officers who better understand their rights and duties. But so long as the present rules of marking and counting exist, it is ridiculous to talk about the elimination of wrangling and bad feeling over the polling-place returns. The Grand Jury, like the State Superintendent of Elections, puts in a word for the use of voting machines. These, of course, do eliminate all disputed counts and minimize the harm that a bad election board can do. Yet we are strongly of the opinion that the adoption of a new form of ballot resembling either that of Massachusetts or Montana should precede the purchase of the machines.

The Society for the Prevention of Cruelty to Animals has not, under its present management, the slightest claim upon public confidence. The proceedings at Thursday's annual meeting show clearly enough why President John P. Haines has so steadily refused to render a detailed accounting of the moneys which he has received and expended. If there has been no actual stealing—and there are a number of suspicious items to be explained—at least the bookkeeping has been incredibly slack and inaccurate. What the eminently respectable gentlemen of the board of managers

have been doing in recent years is a question which should be pressed home, not only by every subscriber to the funds, but by every taxpayer who is interested in seeing that dog-license fees are properly disbursed. The inefficiency of Mr. Haines's administration has been notorious; and yet some of the best-known men in this community have consented to play the rôle of dummy directors, and by their acquiescence in abuses try to delude people into the belief that all is well with the Society. What is needed now is a clean sweep, both of those who have been directly guilty of maladministration and of the managers who have been recreant to their trusts and have supinely assented to wrong-doing.

Now that the Funeral Drivers' Union has been organized here, and the closed shop agreed upon, deaths and burials will no doubt be put on a far more businesslike basis. It has long been a cause of complaint that thoughtless people choose exceedingly inconvenient hours and places for departing this life. Hereafter, persons wishing to die will be notified to do so between 8 A. M. and 5 P. M., with an hour off at noon for dinner. Deaths occurring after hours or on Sundays or holidays will be charged for at the rate of time and half-time. No person will be accepted for burial unless he has a union card in his pocket. Walking delegates will supplant clergymen at the services. Contracts may be entered into with the New York Central and Interborough Railway Companies to arrange all accidents according to a systematic plan, say, on Monday, Wednesday, and Friday afternoons, thus not interfering with the Saturday half-holiday. Visitors to cemeteries in the Bronx will be required to go by the Union Railway, in which case they will probably be old enough when they get there to know better than to come back. In that way they will spare the funeral drivers needless work. Finally, the old-fashioned "At Rest" on tombstones will be discarded in favor of a neat union label.

In offering the Curatorship of Paintings to Mr. Roger Fry, the Metropolitan Museum takes a step that promises the best things for the impending reconstruction of the staff. Mr. Fry is a young English painter who has made for himself an excellent position as an historian and critic of art. He thus combines a practical knowledge of the materials of painting with a wide experience of all the European schools. His personal preference is for the Italian primitives, and this is fortunate, since the Museum, now lamentably deficient in that field, may count upon an intelligent and systematic building-up in this neglected branch. In all his critical work Mr. Fry has given evidence of a judgment not only keen, but also controlled by good sense. His work has been free from the aberrations so common among connoisseurs. Among our artists and amateurs he is no stranger, and both personally and officially he may be sure of his welcome. His appointment will mean, we are confident, that the curators are to be responsible for the upbuilding of their own departments and are to have the spending of their own funds. On no other principle can a museum grow satisfactorily. And if an officer is not competent to judge the needs of his own department and make his requisitions on the treasury judiciously, the remedy is not to tie his hands or subject him to delays in consultation, but to replace him with one who has the obvious qualifications for a curatorship. Mr. Fry's coming, then, will be a welcome indication that the complicated and unbusinesslike system which has trammelled the Museum from its foundation to the present day, is about to yield to what we may call the "cabinet idea," by which the heads of departments shall have ministerial independence and responsibility.

Another art museum is in luck; the Field Columbian Museum at Chicago will receive a bequest of $8,000,000 from the estate of the late Marshall Field. It is the largest gift ever made for such a purpose. To transpose this sum of money into terms of art is difficult, yet comparisons may aid. Even with a liberal deduction of income for administrative purposes, the Chicago museum will have a larger purchasing fund than any European museum. With our own Metropolitan Museum and that of Worcester, the Columbian is in a position to compete in the art markets of the world. In this power there is some compensation for being late in the field. Yet it brings some corresponding dangers. Already the Metropolitan Museum is beset by the most absurd and extravagant proposals. Similarly, Chicago will now become a shining mark for the rampant enthusiast and the guileful art broker. The danger is of letting the new-gotten riches burn in the corporate pocket. The museum that marks every day with a white stone will soon accumulate a most undesirable deposit of minerals. Such cautions are not amiss when this country steps, in a year or two, from the last to the first position as public buyer in the art market. It is only fitting that the funds gathered through the most enlightened business methods, by such benefactors as the late Jacob S. Rogers, Stephen Salisbury, and Marshall Field, should be expended with similar care and judgment.

The British election returns, now practically complete, only confirm the extent of the Unionist defeat. With nine constituencies yet to be polled, the maximum Ministerial majority, reckoning in Nationalists and Laborites, has reached 353, while the actual Liberal majority is 95. For the moment there has been returned only a handful of Mr. Balfour's Cabinet to constitute the Front Bench Opposition; and though this ragged firing line will undoubtedly be recruited by the withdrawal of Unionist members to make place for ex-ministers in safe constituencies, it is clear that Mr. Balfour's reported plan of heckling "C-B," will be pursued under considerable difficulty. The Independent Labor party has returned 45 members. This group, in conjunction with the 84 Irish Nationalists and the Unionists, might make trouble in case of dissension on the Government side, but it is hard to imagine circumstances that could lead to so unnatural an anti-Liberal alliance. The party that has converted the Conservative majority of 134, in 1895, to a Liberal one of 95 to-day, need hardly fear any sudden reversal of the verdict of the country. Unionist editors will take what comfort they may from the fact that the majority of votes cast is relatively small in favor of the Government. This is due partly to the plural vote. As members of a university convocation, as possessors of offices in the City, or of residences in both London and the country, many Englishmen vote in two or more constituencies. And, curiously enough, it is precisely in Lombard Street, among the aristocracy and among the *intellectuels* of the universities, that Chamberlain has exercised the greatest glamour.

To have provided kings for two new thrones, those of Greece and Norway, and queens for Great Britain and Russia, is something of a title to remembrance, and the late Christian IX. of Denmark will possibly be remembered chiefly from the honors that fell so readily to his children and children's children. The eagerness with which greater monarchs sought alliances with the house of Oldenburg, and European chancelleries welcomed its scions as candidates for debatable thrones, testifies not only to the strict neutrality of Denmark, but also to general confidence in the royal stock. Its daughters have been judged worthy to bear kings, and its sons to rule justly. Few monarchs have been more sorely tried than King Christian. Early in his reign the Danish Duchies were torn from his kingdom by Germany, and England permitted the spoliation with a supineness that aroused Mr. Robert Cecil, later Lord Salisbury, to his highest flights of satire. The last years of King Christian were saddened by the growth of a radicalism which, while disapproving, he accepted with all loyalty and equanimity.

"SOCIETY" JOURNALISM.

The acquittal of Norman Hapgood on the charge of criminal libel is a great victory for decency. The editor and the proprietors of *Collier's Weekly* were actuated by a high sense of duty when they told the unvarnished truth about Justice Joseph M. Deuel's connection with Col. William d'Alton Mann and his nasty sheet, *Town Topics*. Fortunately, *Collier's* is prosperous as well as courageous, and, when called upon to defend itself, was able to wage the contest to the bitter end. It secured skilled counsel, and in the collection of evidence it spared neither energy nor expense. The result was a sickening revelation of the weakness and vanity of men prominent in the financial and the fashionable life of this community. *Town Topics* was exposed as a parasite upon the social body. Its editor, a bankrupt in fortune and in character, was filling his pockets by bullying the rich who might be liable to attack in his columns, by selling them stock at preposterous prices, by borrowing from them on worthless security, or by whining at their doors. A more repulsive picture of journalism of the gutter has never been drawn. All these facts *Collier's* fearlessly laid bare. The medicine, though bitter, has been wholesome. If New York society and the country in general profit by it, the credit will be due to *Collier's*, which fought the good fight.

And how about the complainant in this action? *Collier's* declared that it was disgraceful for a judge to be connected with "a paper of which the occupation is printing scandals about people who are not cowardly enough to pay for silence." Justice Deuel appealed to the courts for redress. It took the jury seven minutes to decide that *Collier's* was right, and that, as a matter of fact, Deuel's conduct was disgraceful. He has violated the provision of the charter which forbids him to accept employment outside his regular duties. This employment, had it even been legal, would have been impossible for any man who was not lost to all sense of propriety or honor. Deuel is no callow youth, upon whose ignorance or inexperience Mann has imposed. His hairs are white with age. He could be under no illusion as to the nature of the enterprise in which he embarked. When he went to the office of *Town Topics*, week after week, to read the proofs and advise the writers how to avoid libel suits, he was aware that he was engaged in the dirtiest business in town. He waded into the slime with his eyes open. His pretences of virtuous indignation against the follies and sensualities of the "smart set" are transparent hypocrisy. But enough of this wretch—for, as Mr. Jerome observed, he emerges from the trial shattered in reputation.

Back of these two sinister figures, Mann and Deuel, stand the people upon whom they preyed. Our polite and refined society must share the shame of its scavengers. *Town Topics* would have died of inanition long ago had it not been for the criminal rich and the silly rich. The first class, swollen with ill-gotten gains, men whose business is gambling and swindling, and whose pastime is vice, have furnished abundant material for salacious paragraphs; and, when attacked beyond endurance, have paid handsomely for being let alone. Their troubles, however, are primarily due to their own guilt. The silly rich are the ones whose plight is pitiful. They are often innocent, well-meaning folk. With a guilelessness that approaches imbecility, they suppose that they gain distinction when their names are printed in the society columns of *Town Topics* and other newspapers, and when they are asked to subscribe to the ridiculous 'Fads and Fancies of the Four Hundred.' A three-year-old girl artlessly displaying a new ribbon is a model of dignity and reserve compared with the grown women who give descriptions of their gowns to society reporters, and who thrill with pride when the lists of their guests are thrust before the public. It is upon the bad taste, the ignorance, and the vanity of this tribe of the witless that Mann and Deuel have battened. By flattering, cajoling, and threatening those who have everything but sound judgment, they have made *Town Topics* and its allied ventures a gold mine. It was like stealing candy from a baby. If our silly rich are incapable of taking to heart the lesson of these disclosures, they would remain unmoved by the thunders of Sinai.

It must be a disagreeable revelation to some of our contemporaries that maintain a "society column," to find themselves in the Mann galley. Several of their "society editors," it appears, have been purveyors of tattle and scandal to the general sewer for that sort of thing now laid open. The result ought to be, we think, to raise sharply the question how we are going to distinguish between the reputable and disreputable in that kind of journalism. "I hear," said Matthew Arnold with one of his sweetest smiles, speaking to a youth who had got an article into an English "society journal"—"I hear that you have become one of ——'s hired Stabbers." Col. Mann's list of contributors, as disclosed on the trial, was plainly not composed entirely of stabbers. Literary folk have often an innocence equalled only by their need of money, and we have no doubt that many a book-review or general article has been written for *Town Topics* with honest intent by honest writers—though their cheeks must now be tingling as they think with what a crew they were associating. But we fear the same cannot be said of the thoroughly sophisticated "society editors" who were in Col. Mann's employ. It may be set down for certain that they were not hired for their *beaux yeux*. Indeed, the evidence was clear that, in one case at least, a society editor was paid to fetch and carry servants' gossip.

This certainly casts a comic, or ghastly, light upon the reports of doings in elegant and exclusive society printed in many reputable newspapers. How much of this class of news is handed out at the area-door like cold victuals? How many enterprising society editors get admission into the houses of the great, as the Newport correspondent did, disguised as a musician? If it is the servants' hall, and not the drawing-room, whence comes the tittle-tattle over which so many of the people whom Thackeray called the "would-be genteel, the silver-fork worshippers," pore in the rapt conviction that they are thereby brought into touch with the richest and therefore the most enviable of mortals, the fact ought to be known.

But the entire blame for these absurdities cannot be loaded upon the shoulders of silly or venal writers for the press. They could set up the defence which is offered, for what it is worth, in the case of other kinds of journalism. They could say that they are giving "society" what "society" demands—or, at least, likes. If the coarse smutch of social notoriety were offensive to the majority of those upon whom it is laid by much of the current newspaper "Gossip of the Clubs" and "Notes of Society," the thing would be stopped. We have seen how a few gentlemen drew the line at blackmail; if all the ornaments of society found the glaring publicity given to their parties and their gowns equally distasteful, they would soon cease to be victims. But every newspaper knows that many not only like it, but foster it—even clamor for it. Personal missives detailing the glories of the writer's (or the writer's wife's) raiment, communications from regular advertising agencies giving all the particulars about a "quiet little musicale" or an account of a "very exclusive reception about which society is agog," are far too frequently thrown upon an editor's desk for him to imagine that a shrinking sensitiveness is our chief social ailment.

Let us, then, not be too mirthful over the fine ladies and gentlemen who now have the mortification of seeing their laughable social plans and aspirations and their ridiculous social hangers-on exposed to the public gaze; let us, rather, ask if the whole thing does not betray a false standard, for setting up which each of us is in his way partly responsible. Are we all, in practice, believers in the truth that the highest society is the most intellectually and morally refined society? Do we all hate and shun the little tricks of *réclame*? Is it

a real annoyance to us to be among the mentioned or the photographed on occasions which set the crowd agape? Do we think more of the conversation at a dinner than the wealth and dress of the company or the excellence of the food? Would we give more to keep out of the Court Circular than to get into it?

In the lifting the roof off *Town Topics* we have had given us a picture of "society" as illuminating in its way as the picture of high finance which Mr. Hughes had previously drawn for our instruction and reproof. But in one case as in the other the true moral strikes far and wide, and hits spectators and censors as well as the immediate and exemplary sufferers. And as the insurance disclosures will fail of their due effect unless they make us all more scrupulously honest and delicately honorable, so the bringing of this huge basket of social scandal to the public laundry will avail us little unless out of the disgust spring a new simplicity and sincerity, with fresh resolves to make of social intercourse, not a milliner's show or a crackling of thorns under a pot, but a means of furthering whatsoever things are true, lovely, and of good report.

"THE WASTEFUL WEST."

The conviction on Friday of the Rev. George G. Ware, an Episcopal rector of the frontier and the manager of a Nebraska cattle company, for conspiracy to defraud the Government by means of false homestead entries, marks a further victory in Secretary Hitchcock's war on the land thieves and wasters. It is a significant comment upon the spirit of the heedless West, confirming what Mr. Emerson Hough, in writing of the pine-lands adventurer recently, says of the careless waste of the people. Scarcely more than half of the available good timber in the country has been used—mere waste has accounted for the rest. Though, as Mr. Hough says, "if we had our forests back, we could afford to wage two civil wars and not be in debt for either," and could wage one on the value of the burned and rotted timber, forest waste is only one item in the big bill to be charged against the reckless West. Against the cattlemen, who have enclosed areas equal to principalities and reserved for the use of their scattered herds States capable of supporting New England's population, the charge of prodigal extravagance holds equally; it holds to a less degree against the miners; and the very farmers themselves—our models of frugality and productive economy—have tilled their fields apparently with the idea that when the land was exhausted by their unvarying crop routine, they could move across the road to fresh soil.

It is only when this big "God A'mighty's estate" has shrunk to a small fraction of its original value that any one in authority has stopped to consider the waste. Because the good timber has absolutely passed out of the possession of the public, the West is beginning to listen to the new talk about forest conservation and the replanting of denuded areas. But in the cattle country to-day they speak of Secretary Hitchcock's honest efforts to protect the settler against the big pasture pirates as the fancies of a man suddenly gone insane. To the cattle owner it does not appear to be waste to bribe soldiers' widows and orphans to "enter" forty sections of public land to be turned over to him, and then coolly to fence forty more sections of the domain supposed to belong to the public. He says, and believes, that every head of stock he owns must have twenty-five acres of range. Millions of acres of land classed as "worthless, except for grazing," is in the possession of the herd owners, and only a few settlers who are in search of good land know that the classification is a farce. Mr. W. R. Lighton, in the Boston *Transcript*, cites a case in illustration:

> "One year ago a ranchman in the neighborhood of Lusk, Wyoming (twenty-five miles west of the Nebraska line), bought a tract of 320 acres which had been in use at cattle range for many years. The price paid was $1,000. By way of experiment this tract was enclosed by fences to exclude grazing animals, and the wild bunchgrass was permitted to grow undisturbed. With absolutely no other attention, three hundred tons of bay were cut last summer, . . . which was sold in the stack on the ground for seven dollars a ton."

This particular tract of grass land was not exceptional; it was "high-divide" land, like millions of acres of the kind upon which the twenty-five-acres-to-a-cow rule holds. It is in the same region, on the North Platte, in western Nebraska and eastern Wyoming, that $3,300,000 has been allotted by the Government to a project to reclaim 100,000 acres of "desert" land by irrigation. No wonder President Roosevelt's irrigation policy has proved so popular in the West! The man who could divert the bothersome settler from the grazing lands to the absolutely arid regions by turning water into the sage brush and making the settler pay for it, deserves a monument, and the cattlemen would undoubtedly subscribe to build one. But for Secretary Hitchcock no cow-country memorial will be raised; no "timber Senator" will ever sing his praises, and only the Federal grand juries that return indictments agaist the mineral land thieves, the "timber-land miners," will breathe his name with respect. His one idea seems to be to get the man—cowman, sawmill owner, or miner—off the land he does not own and which is owned by, and held in trust for, the landless. Consider the contrast: The reclamation service has spent, or is to spend, $28,000,000 to reclaim a million acres of desert for which settlers will pay $28 an acre; the Interior Department in the past year has found more than 500 indictments in nineteen States against land thieves, and this "is but the result of preliminary skirmishing." Under one law, the Kincaid act, some 2,000,000 acres of land in Nebraska have been fraudulently obtained by the cowmen.

This Kincaid act is an illustration of the general official laxity in regard to the public land. It was a bit of special legislation providing for the creation of "grazing homesteads" of 640 acres in western Nebraska—the ordinary homestead, of course, being 160 acres. Now here was an inexcusable legalization of waste, tried as an "experiment" with the support of the President, who in his message to Congress referred to "the proposed extension of it to other States." Instead of a prompt pulling up on the part of Congress, we have Mr. Lighton's assurance that "already Congressmen Martin of South Dakota and Brooks of Colorado are fashioning bills upon the Kincaid model; Mondell of Wyoming is to follow suit in the interests of his eager constituents; Montana is also in this waiting line, and there are indications that a half-dozen other States are to help in the formation of a flying-wedge which will carry the deal through."

The attitude of the West toward the wasters of the public domain is like the attitude of Wall Street toward the insurance grafters. It is an "open game," with equal chances for all. As Fred Dumont Smith, a Kansas State Senator and a valiant fighter of the Standard Oil monopoly, who was indicted recently in connection with land frauds in his State, says of the new activity of the Interior Department, "the United States is in mighty small business" when it prosecutes those sturdy pioneers who are making Government land fertile with windmills. The only trouble with Senator Smith's argument is that these "best citizens" and "sturdy settlers" of western Kansas are, as a rule, wealthy residents of cities far from their humble ranch firesides. The history of the pillagers of our forests is being repeated in the public-land States. As it was thought impossible to exhaust our magnificent pine lands, so it is taken for granted in the West that "God's out o' doors" will last indefinitely.

THE "BENNINGTON" COURTS-MARTIAL.

The acquittal of Ensign Wade, the engineer officer of the ill-fated *Bennington*, with the all but similar decision in the case of her commander, Lucien Young, by the court-martial which tried them, is very unfortunate. The court of inquiry was so certain that Ensign Wade was responsible for the accident that it recommended the court-martial. Secre-

tary Bonaparte differed from it to the extent of insisting that Commander Young also be tried. Now, the question is whether any one is to be held responsible. Is this disgraceful affair to be dismissed as a visitation of Providence? Commander Young was reprimanded merely for failure to attach his signature to the "smooth steam log" of the *Bennington* during the seven months of 1904 and 1905 antedating the disaster. On every other specification of the charges against him he was acquitted.

Obviously, no sane person can attribute to this technical carelessness of the commander the disaster to his ship. The Judge Advocate-General and the Secretary of the Navy alike disapproved of the court's decision as to both Young and Wade, and returned the findings in the latter's trial for a revision, which resulted only in the court's adherence to its original decision. Since no officer is to be punished for what could only have been due to gross negligence or inefficiency, the public has the right to ask several pertinent questions. For instance, is it not fair to conclude that this representative court-martial, in acquitting these officers, meant to throw the responsibility on the present naval engineering system? And what assurance is the Navy Department now prepared to give that there will not be a similar disaster any day? When the accident occurred, Secretary Bonaparte earnestly besought press and public to withhold criticism or condemnation until the facts could be ascertained. His request was granted. It is now time, in view of the failure of his judicial machinery to exercise a deterrent influence by such severe punishments as would have been inevitable in the British navy, for the Department itself to place the blame and to let the public know whether men or system were at fault. Was the Bureau of Steam Engineering lax, or does the final responsibility rest on the Bureau officer who put Wade in sole charge of the engines?

It is the system which is now on trial, that arrangement of 1899 by which line and engineer officers became one, and are now supposed to be ready to serve on the deck or in the engine room, as they may happen to be assigned. Under it the conditions in the navy have gone steadily from bad to worse. Secretary Bonaparte himself has published his uneasiness over it. Rear-Admiral Melville, our best naval engineer, has repeatedly come out against it. Even the present engineer-in-chief, Rear-Admiral Rae, in his last annual report, called for additional engineering specialists—82 in number—and admitted the present dangerous conditions by saying that "such a plan, if systematically carried out, would soon furnish the service with a body of competent engineers, and would place engineering where it properly belongs, in the line of the navy." But just why 82 engineering specialists, most of them doing permanent shore service and never going to sea, should be considered as part of the line, except by courtesy, may well be asked. Plainly, this plan is nothing but a compromise; an endeavor to have a separate body devoting all its time to engineering, and yet indistinguishable from line officers by rank, dress, or title.

Still another defence of the amalgamation is that by Lieut.-Commander Chandler in the current *Proceedings of the Naval Institute*. He is certain that the *Bennington* disaster and the consequent attacks upon present conditions should not alter the law of 1899. Like Rear-Admiral Rae, he admits that so young and inexperienced an officer as Ensign Wade should never have been given full charge of the *Bennington's* engines. Such defects as have arisen in the working of the law, he attributes to the "enormous deficiency in the total number of officers, and the comparatively little time and attention given to steam engineering in comparison with other branches of education." Young officers, he finds, have not been encouraged to give special attention to engineering, and those who have taken it up have done so without any particular assistance from the Navy Department. The fact that a few line officers have by their own personal exertions perfected themselves in engineering is to him proof positive that amalgamation can be made all that was expected of it, provided only that the law be lived up to. Yet even he admits the necessity of some change in the original plan in order to provide the navy with designers of engines as well as operating engineers.

Rear-Admiral Luce has put the question now before the public in the smallest compass in the current *North American Review*. It is "whether or not a man can master two professions." Can he be at once a competent steam-engineer and also a naval officer, whose duties may require him to be a torpedo and gunnery expert, a navigator, an infantry drill-master, an astronomer, and a master of international law? To Rear-Admiral Luce the task seems impossible; and so he heads his article "a plea for an engineer corps in the navy," coming out flatfooted for a return to the old state of affairs—with the one exception, that, in order not to bring about the old-time rivalry between line and staff, he would not have the engineers educated partly for the line at Annapolis, but wholly for the engine-room at some centre, like New York or Philadelphia, where engineering work in modern machine shops could go hand in hand with theoretical studies. In other words, he would give the engineer officers a more thorough training than that of the old days.

To some such plan as this we are convinced that the *Bennington* disaster should lead. We are of the same opinion as in 1899 that the amalgamation law aims at the practically impossible. In view of the reflection upon the Department in the outcome of the *Bennington* court-martial, some decision as to a change should be reached at the earliest possible moment. Either Rear-Admiral Rae's plan must be attempted, or Rear-Admiral Luce's. The former will inevitably lead to the latter, in our opinion. But what the public wants now, and has the right to demand, is the prompt assurance that no such inexperienced officer as Ensign Wade shall ever again be put in charge of engines, no matter how short-handed the Department may be, and that this whole engineering question shall at once be threshed out by a joint board of naval experts and civilians, in order that proper legislation may be prepared without any delay. The frank admission on all sides that the engineering service is in chaos, with the failure of the Mare Island court to punish, should lead to immediate action.

JOSEPH WHEELER.

The death of Gen. Wheeler emphasizes afresh the end of an era. There survives not a single one of the great military commanders of the Confederacy. Mosby, the scout and guerrilla, now residing in California, is perhaps the last of the Southern military leaders whose doings at one time were in every mouth. But of the Confederates of high soldierly renown won by the hardest kind of fighting in battle after battle not one still lives, unless we except Simon Bolivar Buckner or A. P. Stewart. The Northerners who commanded corps or independent forces and remain to tell of their exploits may almost be counted on a man's fingers: Schofield, Schurz, Howard, Dodge, Sickles, Grierson, Merritt, T. J. Wood, Wilson—the list is pitifully short, particularly when one considers that three-quarters of a million of the rank and file are still on our pension rolls.

A great cavalry leader Joseph Wheeler undoubtedly was before he was twenty-seven years of age. Robert E. Lee ranked him next to J. E. B. Stuart, who is admitted to have been the greatest cavalry genius produced on either side during the civil war. The Confederacy never had any prejudice against young men or West Point graduates. It did not allow them to be shoved aside by political generals as so often happened in the North. Hence, men like Wheeler, Stuart, Beauregard, the Lees, Johnston, Longstreet, and a number of former officers of the "old army" came to the front early in the South and continued as the stars of the service until the end. In the North, on the other hand, Grant, Sherman, Sheridan, Meade, and Thomas were long in obtaining high commands.

In the cavalry particularly, the South had the advantage, especially as there were so many more practised horsemen to draw upon than in the North. Besides natural-born cavalry leaders like Stuart, Wheeler, and Fitzhugh Lee, it had Forrest, Mosby, and Morgan for scouting and guerrilla work, and for a time these men had things a good deal their own way. Gradually, however, the North found men to combat them at their own game. Sheridan, Merritt, Custer, Pleasonton, Grierson, Averell, Wilson, Kilpatrick—to mention a few—appeared upon the scene, and were capable not only of being the eyes of the army and protecting its flanks, but of conducting long raids into the enemy's country, destroying communications, and harassing an army by persistent sticking to its flanks.

This latter was a habit of Gen. Wheeler's in which he excelled. When Sherman marched to the sea, Wheeler was ever in touch with him, refusing to be driven off and clinging like a leech. Later on, when Sherman marched northward from Savannah, Wheeler again went after him, sticking to him no matter how worn his horses or tired out his men. That northward march of Sherman's is rightly celebrated because of the extraordinary physical difficulties encountered, owing to bad roads and worse weather. But what he did, Wheeler did too. Those same optimistic qualities which distinguished the little general at Santiago and made him confident that that city would soon be taken, even when he was down with fever and Gen. Shafter wanted to retreat, were then manifest, together with determination and aggressiveness. He and his associates and Northern rivals practically revolutionized the handling of cavalry, and made of it an extremely mobile mounted infantry, fighting with equal efficiency on horseback or on foot, as quick to throw up entrenchments as infantry, and able to endure extraordinary hardships and cover great stretches of territory with surprising speed. Europe was slow to learn the lesson of this, and has not yet wholly acquired it. To the British, however, the Boers brought it home, and, as Gen. Sir Ian Hamilton has recently said, Europe must speedily digest this and other teachings of our civil war if it would make progress in a military way.

While history will thus always have a very high place for Gen. Wheeler, it will also dwell much on the sentimental aspect of his career, which arises from his resumption in 1898 of the blue uniform which he, a rebel, had laid aside thirty-seven years before. It is not necessary to speak of this action of his and of Gen. Fitzhugh Lee as typifying the final reunion of the North and South to lend it its proper importance. In some aspects, the North and South are to-day as far apart as in 1861, and must continue to be, so long as there are radical differences between them over fundamental questions like that of the suffrage. Moreover, nobody had for years doubted that, in the event of a foreign war, the South would fight with all its old-time bravery and dash. Certainly no American citizen looked for anything else in 1898.

Nevertheless, the return to the United States Army of Fitzhugh Lee and Joseph Wheeler was both picturesque, striking, and (waiving the morality of the war itself) praiseworthy. History contains few parallels. That men branded in 1861 as traitors and rebels, as deserters from an army in its hour of need, from a Government which had educated and supported them, could within their life-time be given high rank and important commands in that same army, would have seemed impossible as late as 1880. It was the final proof af the far-sighted wisdom of the magnanimous policy of the victor towards the vanquished which must ever be one of the glorious pages in American history. Had Jefferson Davis and his Cabinet been hanged, and his generals imprisoned, permanently disfranchised and excluded from participation in the Government, there must have remained enduring sores and lasting grievances. As it was, Lee and Wheeler had no personal grudges to hold them back in 1898. It was not given to them to be of great military value to the Union in the war with Spain and the subjugation of the Filipinos, but their commissioning was well worth while from every point of view, and must have been for them the greatest happiness of their lives.

AUTHORS OF PRESIDENTIAL MESSAGES.

Professor Dunning of Columbia has reprinted from the Proceedings of the Massachusetts Historical Society his interesting paper on the first annual message of Andrew Johnson. That public document was, in fact, written by George Bancroft. This is the strange discovery which Professor Dunning made when rummaging among the Johnson papers in the Congressional Library. His story of the identification has almost a detective flavor. The notes and rough sketches of all of Johnson's messages were preserved in large envelopes, but the one covering the message of 1865 had little in it but a complete draft. This was in a handwriting not Johnson's or that of any person in his employ at the time. While Professor Dunning was mildly wondering at this manuscript, Mr. Worthington Ford came up, and, noticing the writing, said, "Why, that is George Bancroft's hand." Thereupon it flashed upon the Professor that he had seen in the files of Johnson's letters a note from George Bancroft, marked "private and confidential." It ran as follows:

> "My task will be done to-morrow, but as no one knows what I am about and as I am my own secretary, I must ask a day or two more for a careful revision and for making a clean copy, which must be done with my own hand."

The date of that letter was November 9, 1865. It was on December 5 that the message was sent to Congress. The interval was, therefore, just about what would have been natural for Bancroft's copying, and we have the draft of the message in the same handwriting as the note speaking of his "task," and referring to a "copy which must be done with my own hand." Careful collation of the Bancroft draft with the message as actually sent in and published, shows that there were only a few modifications of the phrasing, with here and there the insertion of a routine paragraph summarizing the work of a department. The demonstration is complete. The real author of the President's annual message of 1865 was, not Andrew Johnson, but George Bancroft.

This fact, we can now easily see, had much to do with the high favor with which the message was received by the country. Johnson was in a trying position. Not only had his unequal hand to be put to the work dropped by the mighty Lincoln, but he had, if possible, to overcome the unhappy impression made by his public behavior on entering office. It was feared that he would prove to be a boor of low habits. Hence it was certainly a stroke of luck for him that his first important state paper should bear the hall-mark of dignified writing. It won instant and wide praise. Professor Dunning quotes some of the current approval. The *Evening Post*, he reports, found the message "frank, dignified, direct, and manly," with "not a single ambiguous sentence." He notes also:

> "The *Nation*—and here was praise from the very throne itself—declared that any American might read it with pride, and found solid hope for democracy in the fact that such a document should have been produced by 'this Tennesseean tailor, who was toiling for his daily bread in the humblest of employments when the chiefs of all other countries were reaping every advantage which school, college, or social position could furnish.'"

Probably no other message was ever "conveyed" so bodily by a wise President, yet our Chiefs of State have usually been ready to exercise a sort of literary eminent domain. Whenever a friend or adviser had a happy thought or a well-written passage, apt for message or speech, Presidents have made it their own by appropriating it. There is more of Hamilton than Washington in the Farewell Address. Many of Andrew Jackson's public utterances came hissing hot from the fire of his kitchen cabinet. Mr. Cleveland was, no doubt, much beholden to the pens of others. Daniel Manning and David A. Wells are

supposed to have been responsible for some of the phraseology of his famous tariff message; and Gresham and Olney left their sign manual on the Hawaiian and Venezuelan messages. But Presidents have always leaned heavily, in such matters, upon their Secretaries of State. It was noted that President McKinley's speeches and state papers gained an unwonted and welcome literary quality after Mr. Hay had entered the State Department. In a Boston speech, that least poetical of Presidential orators dropped into verse from a little-known poem of Mr. Hay's own. As for our present voluminous producer in the White House, no one living man will have the audacity to claim personal responsibility for anything but a few drops of that mighty flood; yet there are literary claimants, even here, ranging all the way from Jacob Riis to President Mellen.

We are dealing, of course, with no vulgar question of plagiarism. The problem of authorship, strictly speaking, seldom arises in connection with Presidential messages. They, as a rule, are mosaics; and only the higher critic who can confidently dissect out the documents in the Pentateuch would venture to assign the various bits to the Secretaries, or others, who contributed them. Indeed, it is hard to think of a President as an Author. Greater things are for him. Of none of our Chief Magistrates could it have been written what Horace Walpole said of a young sprig of nobility for whom he played the part of literary godfather: "He thinks nothing so charming as Authors, and to be one." The charming author, to a President, is the one to whom he can go in the seigniorial spirit of a Molière and take from him for his own use the noble sentiments he finds nowhere else so well expressed. This, it may be, is the reason why President Roosevelt quotes so often from himself.

MOZART.

Saturday afternoon's performance of "Don Giovanni" was the only contribution of the Metropolitan Opera House to the celebration of the one hundred and fiftieth anniversary of Mozart's birth, although "The Marriage of Figaro" and "The Magic Flute" may come as postludes later in the season. In our concert halls the jubilee week has been celebrated by putting at least one Mozart number on every programme. In Germany and Austria there has been a real Mozart revival, with headquarters, naturally enough, at Vienna, where the master spent the greater part of his short life and where he died. When Director Mahler, of the Imperial Opera in that city, accepted his post, nine years ago, he made the conscientious, artistic production of Mozart's operas the main object of his managerial activity. Beginning with "The Magic Flute" and "Figaro," he gave performances which served as models for all Europe in the same way in which Wagner intended the Bayreuth festivals to demonstrate to the world the right method of interpreting his own music dramas.

Mahler once confessed that his understanding of Mozart had come much more slowly than his appreciation of other masters. Others have had this experience. Edvard Grieg wrote a magazine article a few years ago in which he berated the Wagnerites for underrating Mozart, although Wagner himself had said: "I believe in God, Mozart, and Beethoven." Grieg tells us that he himself "loved Mozart, then for a time lost him, but found him again, nevermore to lose him." Tchaikovsky wrote to Frau von Meck: "I not only like Mozart, I idolize him. . . . The music of 'Don Juan' roused in me a divine enthusiasm which was not without after-results. . . . It is thanks to Mozart that I have devoted my life to music." Gounod wrote: "The score of 'Don Giovanni' has influenced my life like a revelation." To him Mozart was the master of masters. The three composers just cited belong to Norway, Russia, and France; their testimony bears witness to Mozart's remarkable influence beyond the boundaries of Greater Germany. Such internationalism seems particularly meet in his case, as he himself represents a fusion of Italian and German elements, with a dash of French influence; for Paris, during the several months he spent there as a youth of twenty-two, taught him not a little, especially in the line of orchestral coloring. On Italy, Mozart exerted a deep influence through Rossini and his followers; yet, oddly enough, although he wrote all but two of his operas in the mellifluous Italian style and to Italian words, none of them has ever been really popular in that country, whereas the rugged, boreal music-dramas of Wagner are much in vogue there. Herein lies one of the mysteries of musical history. One of Director Mahler's experiences in Vienna illustrates the present attitude of music lovers in general toward Mozart's operas. Five years ago he mounted "Così fan tutte" in the most sumptuous and artistic manner. No detail was neglected that might help to ensure success, but the deficits reported from the ticket office compelled him, after two months, to drop the opera. Last December, in view of the impending jubilee, he tried to revive it—but in vain; only the first performance drew a satisfactory audience, although the cast was excellent and the attention to details had gone so far as to give the leader a chance to accompany the recitatives on a genuine, specially constructed clavichord. It is useless to meddle with the musical dial. Opera-goers in Vienna, as in New York, have long since made up their mind that of Mozart's seven chief operas ("Idomeneo," "Entführung," "Così fan tutte," "La Clemenza di Tito," "Figaro," "Don Giovanni," and "Magic Flute"), only the three last named suffice for an evening's entertainment. The others contain some gems, but on the whole not only fail to move us, but do not even arouse our interest, except as students of musical history. In other departments the ravages of time are even more conspicuous. Of Mozart's three dozen or more songs, only one survives in concert halls; of his forty-one symphonies, only three are heard today, and those not often; of his still more numerous sonatas and other pieces for pianoforte, barely half-a-dozen are known to modern concert-goers.

It would be incorrect to make the flight of time entirely responsible for this state of affairs. Bach was born seventy-one years before Mozart, yet his works are steadily gaining ground while Mozart's are losing. The conditions of the latter's unfortunate life, and his manner of composing, account for the ephemeral nature of most of his works. He wrote music as other people write letters. Grieg relates that one time, when in Vienna, he saw the MS. of the D minor concerto for piano. "In the finale Mozart was in some way or other interrupted in his writing. When he again took up his pen he did not continue where he had left off. A stroke of the pen over the excellent piece, a new finale, the one which we all know! No laborious search for the lost thread." In some cases this impromptu method worked well; in others it did not. A great proportion of his 626 works are mere *pièces d'occasion*. He wrote songs for his friends as they wrote their names in albums, and cared not what became of them. Many of his pianoforte works were composed specially for his pupils. "The silkworm produces its smooth, regular ball of silk without effort," writes Professor Shedlock, "and in like manner Mozart could turn out allegros, rondos, sets of variations *à discrétion*. The sonata in C minor is, to our thinking, the only one in which he was entirely absorbed in his art."

When, however, Mozart was thus entirely wrapped up in his work he achieved results equalled by few and surpassed by none. His "Don Giovanni" and "Magic Flute," in particular, contain imperishable pages of inspiration; here are oceans of melody and marvels of dramatic characterization, which make it seem probable that had he lived more than a paltry thirty-five years he might have anticipated Weber and even Wagner. He knew better than any one else that he had just arrived at the threshold of his greatest possible achievements. "And now I must go," he said on his deathbed, "just as it has become possible for me to live quietly. Now I must leave

my art just as I have freed myself from the slavery of fashion, have broken the bonds of speculators, and won the privilege of following my own feelings, and composing freely and independently whatever my heart prompted."

Although Mozart's life was thus, like that of Schubert, whom he resembled in so many ways, an "unfinished symphony," he wrote not only much immortal music, but music which it is particularly important that the composers of our time should study and take as a model, because it is preëminent for two important elements which they foolishly neglect, to wit, melody and simplicity. Richard Strauss, the leader of the contemporary culprits, has expressed his great admiration of Mozart; but if imitation is the sincerest form of flattery, then his own works are a criminal libel on Wolfgang Amadeus Mozart.

BENJAMIN FRANKLIN AND ELECTRICITY.

CAMBRIDGE, MASS., January 23, 1906.

One notes a tendency among certain physicists to return to Franklin's one-fluid theory of electricity, and to identify his electric fluid with the ether. This tendency is seen, perhaps, more strongly in England than on the Continent, and it is accompanied by an idealistic trend of thought which forms one of the most remarkable reactions between physics and metaphysics. It naturally leads one, on this anniversary of his birth, to examine his work in electricity, and to comment upon the attitude of the philosophers who seize the present confusion of physicists in the presence of radium and the mysterious phenomena of the X-rays to proclaim the ultimate reversion of the thinking world to an idealistic conception of matter and energy.

It is not often that a scientific man can appeal by his experiments to the whole human race so that, from the most ignorant to the most cultivated, the experiments become household lore. Franklin, we have believed from our infancy, drew the thunderbolts from the sky; in our minds he is the incarnate Prometheus. His kite experiment was dramatic, and the setting of the stage more impressive than an Irving could accomplish. Great cumuli, formed, like the fisherman's genie, out of thin air, darkened the heavens, and, flashing with ire, came on the rising wind to the accompaniment of thunder. The calm philosopher stood with bared head at the centre of the stage, and, by his renowned action, stirred to life the Promethean myth—the strange myth which seemed to foreshadow the relinquishment to man of a celestial fire. Without detracting from his philosophic insight, it can be said in passing that his safety in making the kite experiment is one of the most convincing examples of luck on record. An immediate follower of his example was killed, and to-day no one, even a boy, would dare to repeat the experiment. Instead of being covered with opprobrium for what the common-sense Yankee still calls "monkeying" with lightning, he became the greatest electrician of his age, thus uniting a command over one of the most subtle manifestations of nature to his influence over "that fiery particle, the mind of man." His kite experiment led to a renewed interest in experiments with Leyden jars and electrical machines—experiments which were not due to him alone, but which were brought into notice by his dramatic experiment. The fashionable world of Paris amused itself with electrical experiments; and, instead of playing bridge, the court ladies stood on insulated stools and gave sparks to adoring courtiers. In most colonial houses, fifty years ago, there was a popular engraving representing Franklin at the court of Louis the Sixteenth, being crowned by the ladies in the presence of a brilliant assembly of courtiers. Artists painted him gazing out of the canvas with that imperturbable smile "o'er all the ills of lightning victorious," while forked flashes were seen through the open window.

When we examine Franklin's work in electricity, we discover that the results of his experiments and the repetition of those of foreign investigators are embodied in his one-fluid theory—a theory which seems to have been given a new lease of life by the modern theory of the negative corpuscle. In Franklin's view, the negative state of a body was explained by a deficit of a fluid. The negative-corpuscle theory accounts for it by the detachment of a negative corpuscle from a positively charged body. A positively charged pith-ball shows a negative state when the negative corpuscles are detached, in comparison with a positively charged pith-ball which retains its full complement. We can picture to ourselves a species of electrical vacuum thus created between the balls. The electrical condition of the surrounding space is disturbed and the balls are forced together. This statement merely expresses what takes place, without giving any illuminating reason for the action; and we have to confess that we are no nearer a decision between the claims of the one-fluid theory and the two-fluid theory which was in vogue before Franklin enunciated the former, than the philosophers were 200 years ago. The truth is, that Franklin got hold of the hardest end of electricity, and could not make much progress. His experiments were interesting, but did not really lead to the great development of electricity seen in the nineteenth century. The electric spark may be said to contain the whole potentiality of electricity. During 200 years we have learned little more than Franklin knew about it; and it must be confessed that our study of lightning has not conduced to the great development of practical electricity. Indeed, lightning is still a terror and an impediment to electrical enterprise. It was reserved for that remarkable race, the Italians, through Galvani and Volta, to open a more fruitful method of studying the phenomena of electricity. Without the battery, Franklin's results would have remained on a par with the philosophic observations of the Greeks—somewhat more extensive, but food for philosophy rather than for science, being devoid of measurement. Without measurement, science cannot advance beyond the wild surmise of the philosopher. It must be said, however, that Franklin had the merits of an early explorer, and doubtless excited the imagination and increased the interest in the subject of electricity. The explorer on the Peak of Darien, gazing on the mysterious ocean spread before him, doubtless thought of Eldorado, new peoples, and wonderful products of new climes. As long as philosophers worked with electrical sparks without measuring instruments, their vision did not include an electrical Eldorado.

Franklin had a clear sense of the universality of the manifestations which he studied; and when Mr. James Alexander of New York suggested that the velocity of electricity could be measured by allowing it to run down certain rivers and to work its way back by other water-courses, Franklin showed clearly that all parts of such a circuit would respond instantly to an electrical stimulus. He evidently believed, however, with Mr. Alexander, that electricity would follow the water-courses instead of being instantly dissipated in the earth; for he ranked water with metals in respect to electrical conductivity.

When we class Franklin with the non-measuring philosophers, we shall be asked, "Did Faraday ever make a quantitative measurement?" and we can answer that Faraday had essentially a mathematical mind, which did not express itself in symbols: he was a scientific poet without the rhyme. His mathematical conception of lines of force forms the basis of the most mathematical and the best treatise on electricity ever published. Maxwell's treatise on electricity and magnetism. We propose, therefore, to class Franklin among philosophers who have condescended to study nature—the type which has a *raison d'être*, but which is not the best working type, for they have not the essential tools. His principal work in electricity resulted in the formulation of the one-fluid theory, which we may class as a philosophical production, not engendering any unanimity of belief; and in the kite experiment, with the application of the result to lightning-rods. Even to-day there is not a realizing sense of the amount of energy which is often manifested in a lightning discharge, and which no lightning-rod is competent to carry to the ground. The early experiments with glass electrical machines and with Leyden jars, and the celebrated kite experiment, gave an erroneous impression of lightning. Timid people still seek safety in a thunderstorm in featherbeds, sit on chairs provided with glass legs, stand on plates of glass, or feel confidence in rubber boots. A moment's reflection will convince us that a discharge of lightning often many hundred feet in length cannot be prevented by a few inches of glass or any insulator. It would be highly unsafe to repeat Franklin's kite experiment if one stood on a plate of glass in proximity to the string, for lightning exhibits a side flash. From the fact that Franklin was not killed, certain electricians believe that he did not actually draw lightning from the skies, but merely showed that there was a difference of electrical state between the higher regions of the sky and the ground. On many days under a clear sky one can obtain sparks from a kite string suitably conducting. It was reserved for Faraday to show that the only complete protection from lightning is a metallic cage.

I should soon lose the attention of the general reader if I endeavored to develop at length the theory that all matter is electrical, and that it consists of knots in the ether. This theory is based *au fond*

on what is termed electric inertia—that is, the disposition of an electric current to continue when the circuit, or wire carrying it, is broken, and to resist starting when the circuit is made, or the ends of the connecting wire are coupled with the dynamo or battery. This illustration of something resembling the inertia of matter is not a very scientific one, but it perhaps enables one to grasp the idea that the reactions between currents of electricity formed in space might cause the inertia which enables us to conceive of matter. The attitude of physicists toward this electrical theory of matter is simply this: Let us see how far a mathematical treatment based upon this new conception will carry us, for in this analysis we may be able to clarify our views without committing ourselves finally to a theory which seems at first sight to be so opposed to daily experience, a theory of no matter. Franklin, in his one-fluid theory, did not identify electricity with possible motions or knots in a universal ether. He held fast to the usual conception of matter, something that you could hit your head against; and he conceived of a subtle fluid, the electric fluid, which was contained in different proportions in all bodies. The particles of the fluid are supposed to repel one another, according to the law of the inverse square of the distance, and to attract those of matter according to the same law. Those of matter are supposed to repel each other and attract those of electricity. We have, then, cases of surcharge and cases of deficit, which are analogous, perhaps, to conceptions now much in vogue in England, and which arise from the theory of the negative corpuscle.

The power of words has never been more strongly exemplified than by the effect on mankind of the celebrated line of the Frenchman, "Eripuit cœlo fulmen, sceptrumque tyrannis." I have analyzed the major part of this proposition, and I leave the minor part to the historians.

JOHN TROWBRIDGE.

WINTER EXHIBITION AT THE ROYAL ACADEMY.

LONDON, January 1, 1906.

For some few months past, various rumors have been about as to the change the Academy proposed to make in the character of its Winter Exhibition. Academicians, it was said, had discovered that the result of the annual show of Old Masters was the depreciation of their own work, and had therefore decided that, to bring back academical masterpieces into favor, there was nothing to do but to boycott the Old Masters. It looks, however, as if, when the time came, the Academicians had not the courage of their weakness. To judge from the exhibition just opened, in order to avoid too abrupt a change, they hit upon a compromise, and resolved to boycott only the foreigner, planning a representative showing of English masters from the days of William Dobson to the very last Academician who died but yesterday. Then, at the last moment, apparently they hesitated again—afraid of the public, afraid of the critics, afraid of the Morellians, for whom the Winter Exhibition has lately been a happy hunting-ground—and a few foreigners were allowed to creep in, to the utter destruction of whatever unity in the series had been proposed.

I do not write this to find fault, for, as it happens, the little group of foreign work contains two or three of the most important pictures in the gallery. The show would be notable were it only for the appearance in it of a Franz Hals, hitherto, in modern times anyway, unknown to fame. That it should have remained unknown so long is the more extraordinary because it is so large a canvas you would hardly think it could have passed unnoticed, especially as it is years now since interest in Hals was revived and he took his rank again, as he should, among the masters. The painting belongs to Colonel Warde, who, it is said, now insures it for ten thousand pounds, though it was bought early in the last century for virtually a song, a mere trifle of eighteen pounds. Prices, it is true, have nothing whatever to do with the real value of a picture, but they make an amusing commentary on the changes of fashion among art patrons, who think themselves people of taste. It is a characteristic Hals, a large portrait group of "The Painter and his Family," according to the Catalogue—of any other family rather than his, according to some critics. Against a landscape background husband and wife sit side by side, their hands clasped. By the father stands the son, a mere lad; the daughter, young and demure, stands near the mother; between and a little behind them, a small black boy, the one solemn person in the group. To the right of the girl, you look to a wide stretch of open country, beautifully suggested, and, in the distance, a town, a low red blur on the horizon. The picture has not the irresistible gayety, the life, the delightful abandonment of that memorable portrait of Hals and his wife in the Rijks Museum at Amsterdam. The richness and joy of youth have left her, just as the touch of rose has gone from her cap, and he—if it is Hals—no longer swaggers with the old light-hearted irresponsibility. But the picture is full of the most splendid, the most vivid, the most masterly passages. The painting of his own long, brown boots, turned down loosely at the top, is as amazing as anything Hals ever did, and the two children have more charm than is always found in his figures. The little girl, so tenderly, so broadly rendered, becomes positively beautiful in her shy, smiling homeliness, positively graceful in the childish awkwardness of her pose; one hand hanging stiffly at her side, the other holding a fan. And the way some of the detail is put in—her gloves, for instance, as well as the unclasped hand of the wife, and Hals's boots—is like a forecast of the splendid breadth of execution, the overwhelming truth, of those two marvelous groups of old men and old women at Haarlem.

This picture will probably monopolize the interest in the little series of Dutch and Flemish masters. But among the few Van Dycks of varying degrees of merit there is one of his very finest, "The Wife of Snyders." You have only to look to know that it was turned out by no diligent factory of pictures, that it is the work of the master, in which no pupils, no apprentices, no assistants, had part. It is very simple—a three-quarter length of a woman, seated, wearing a dark gown and the prim ruff and cap of the day. But it has the splendor, the unity of tone, that marks the masterpiece. The face and the hands, too, are full of character. The detail of lace and embroidery is most delicately indicated, and there is, on a table in the background, a vase of flowers so well subordinated to the figure that you do not see it at first, but, when you do see it, it strikes you as a little masterpiece in itself.

One other picture in the group I must mention, because it is the finest portrait I remember by Cornelius Janssens, a painter who so very often leaves one cold and indifferent. The title in the Catalogue is "Portrait of a Lady in Black," so that it does not, as in the case of the Van Dyck, borrow additional interest from the personality of the sitter. It has all the Dutch austerity of arrangement. It is a half-length; the lady is standing; her pose is simple, her dress is quiet, her jewels make no lavish display. But here again the charm is in the suggestion of character, the beauty of tone, the artist's fine sense of design. In so restrained a scheme he knew how to make everything tell, even to the little coat of arms placed in an upper corner, the one touch of brilliant color in the solemn harmony.

This series covers little more than the wall of one room. The English pictures fill all the other galleries. It is not easy to say upon just what system they were selected. At first, when it is found they begin with Hogarth, one thinks the idea was to make a representative and chronological collection; but many gaps are soon discovered. If, in the third gallery, one goes even further back than Hogarth, to Dobson, who here seems but an English re-echo of Van Dyck, there is nothing by Walker, the contemporary of Dobson, and the painter of that fine "Cromwell" in the National Gallery. There are good Wilsons and Turners, but Constable, Bonington, and Crome are poorly represented, and there is no Cotman at all. Coming down still later, it is hard to say why, if Rossetti and Burne-Jones are included, Ford Madox-Brown should be left out; why, if so much space is reserved for Simeon Solomon, whom the Academy did not care to recognize during his somewhat tempestuous and disreputable life that has only just ended, none could have been spared for an Academician like Dyce, who had much in common with the Pre-Raphaelites and was so much more scholarly than any one of them. The inclusion of Rossetti, Burne-Jones, Simeon Solomon, and others, to whom the Academy remained indifferent when generous recognition would have been of use to them, might almost suggest a belated act of reparation on the part of the Academy. But when their pictures are reached, after passing through three galleries of the work of the earlier British painters, one is inclined to believe the reparation not altogether untinged with malice.

I have said who the foreign Old Masters are, and tried to give some idea of their work. If the earlier British pictures have been gathered together without any particular rhyme or reason, a number of them show what great things had been accomplished by the British school before the protest of the Pre-Raphaelites made itself seen—and heard, too—in the Victorian wil-

derness. There is nothing of Hogarth's to equal "The Shrimp Girl" in the National Gallery, but the portraits are fairly good examples of his power of observation and his tremendous command of technique, and there is a group at Wanstead House that, if somewhat naïvely stiff in the arrangement and pose of the little figures, has, in the room where they are gathered, the beauty of tone and the stateliness he knew how to get out of the domestic architecture and decoration of his time. I have seen more distinguished Reynoldses before this at Burlington House, but it is interesting to come upon the originals of mezzotints and color-prints so popular just now. And then his "Miss McGill, afterwards Countess of Clanwilliam," from Cobham House, I do not think has been publicly exhibited before for many years, and his huge portraits of George III. and Queen Charlotte, if conventional and perfunctory presentments of royalty, are treated with a dignity and an impressive and appropriate sumptuousness of color rarely, if ever, found in the royal portraits of to-day, the royalty of our generation seeming instinctively to want the wrong thing in art, and the painters, on the other hand, becoming paralyzed in the royal presence. Gainshorough, too, I have seen to greater advantage in previous exhibitions. But there is a "Miss Adney," a half-length in an oval frame, all delicate rose and white, that is lovely as decoration if the face is unusually flat and pretty, even for Gainshorough, whose talent was not for vigorous and solid modelling. His "Giardini," the violinist, also tells—the portrait of a man in red coat, that has real beauty of color and much more vigor and life than many of his more celebrated canvases. And the not very well-known portrait of his two daughters has a personal interest, though it fades and the figures seem vague and impersonal when they are compared to the wonderful children in the Hals group.

On the whole, the most striking portraits of the British School come from the men of lesser reputation. The Raeburns are numerous, and are mostly excellent examples, but there is among them one in particular—"Of a Girl" is the indefinite title—that possesses a charm not very often characteristic of his work. The child, delightfully placed on the oval of the canvas, sits with her hands folded in her lap, her long, loose brown mits repeating the note of dull gold in her hair. She is without the sentiment, she is spared the accessories, Reynolds loved. Just as she is in the portrait, so Raeburn may have seen her many times, shy and quiet, sitting with her elders. The pose natural to her was the pose that pleased him, nor did he attempt to improve upon her simple white dress, content to give it no new beauty except the beauty of the triumphant sweep of his well-charged brush. Among the Romneys, also, there is one that stands out above the others, "Mrs. Dawes," a lady long past her first youth, full of the fascination of Lady Hamilton, so that he was able to see more than prettiness in her face, to enjoy the amusing color in her silk gown of orange shot with green, the fine quality of her laces, the depth and air in the gray background. More surprising, however, is the "Portrait of Mrs. Warde," by Opie, who so seldom has any surprises in store for us. But this is really charming in the sympathetic rendering of a charming head and the decorative pattern got out of the placing of the large straw hat with its blue ribbons.

The selection of the landscapes has not been so fortunate, though for this very reason they had on Press Day the greatest success with the critics, who see small use for a picture that cannot be attributed to a painter never credited with it before. "Is it beautiful?" is no longer asked, but, "Is it right?" A stately "Rouen," the white cathedral towering above town and river and bridge, catalogued as a Turner, was dismissed as "not right at all, though the very thing the American would pronounce a characteristic example." Turner may never have painted it, but why the deceit should take in the American particularly, it would be difficult to say, since, if it had not been for the mistakes all Europe made during centuries in the cataloguing of characteristic examples, where would be the modern game of "attributions"? However, right or not right, there are a few very beautiful landscapes, none more beautiful in my eyes than a little "Lake of Nemi" by Richard Wilson, classical in arrangement it may be, with the towered town on a height in the foreground, but so full of light and air—the far hills with houses scattered over the slopes gradually fading into a gray haze on the horizon—that Corot might have signed it. There are also two or three good Turners—a "Venice," a "Pilot-Boat." And De Wint, with a sombre, imposing "Lincoln," is the surprise among the landscape painters as Opie is among the portrait painters.

Altogether, if there are not many great masterpieces, the average of the work of the earlier British masters is excellent. It sets the standard you carry with you into the first of the rooms devoted to the more modern painters—a Pre-Raphaelite room, Holman Hunt is absent, because the death of the artist is a necessary qualification for the admission of his pictures. But Millais and Rossetti appear, and, with them, hang Burne-Jones, their immediate disciple, and Simeon Solomon, a later follower, and Val Prinsep, who, evidently from the canvas now shown, was very much with them at one time. And how does Pre-Raphaelitism come out of the test to which it is now put? Honestly, my feeling was entirely one of disappointment. There was such youth, such romance, such audacity in the Pre-Raphaelite movement—though I ought to add that the more the members of the Brotherhood write about it, the less romance and the less audacity remain; but not even the confessions of Holman Hunt can rob it of its youth, and the movement was a revolt as truly as the Romanticism of *les Jeunes* in France in the thirties, as the realism of the ardent little group of the sixties and seventies. In the other galleries you can form some idea of what it is the Pre-Raphaelites revolted against. There are landscapes with the brown tree and the brown grass that were the deadly sins of art to Holman Hunt; there are a couple of Wilkies, with the trivial tale and sentiment that were to him anathema. And what did the Pre-Raphaelites give in the place of the old conventions? Millais's "Knight at the Ford," the only one of his Pre-Raphaelite pictures shown, may be taken as a fairly typical example. It is in many ways very fine, a remarkable performance for a youth—if, in looking at it, one could only forget the delightful caricature Sandys made of it, the lithograph, now very rare, that Sandys once told me offended Ruskin's father much more than Ruskin himself.

Holman Hunt, in his big book, has just been explaining again what were the methods of this little band of reformers. The same explanation is in some of Millais's letters already published. The young men went down into the country with all the enthusiasm of missionaries, painted their landscape background from nature day after day, and all day, no matter what the effect or how it changed with the rising or sinking of the sun in the heavens. They left spaces for the figures they afterwards copied from their models when they came up to town. I doubt if the "Knight at the Ford" was done quite as scrupulously as the "Ophelia" or "The Huguenot," but all the defects of the method still clung to Millais when he painted it. The horse, with its burden of three figures, in the foreground, looks as if it had been cut out and pasted on. Turn from it, back into the other room, to that big canvas by Hals. How well in the landscape the figures are, how entirely they belong to it! The Pre-Raphaelite gives a thin flat surface of paint; the Dutchman, with no mission in the world except to paint as well as he knew how, gives nature, gives life, as it is. It may be that the Pre-Raphaelites soared to higher themes than Wilkie, with his tiresome "Blind Man's Buff" and "Rabbits on the Wall," but they were apt to let their subjects get the better of them. Some of the pictures I have always remembered as the most splendid by Burne-Jones have a place—"Love among the Ruins," "Laus Veneris." But look at the "Laus Veneris," with its group of women in bright crimson and scarlet and blue, and then turn back again to the Hals and look at the group there, and you will see how much more splendid and sumptuous the color is in their sombre brown and black. Burne-Jones's design seems as much a piece of tapestry as the tapestry he painted on the wall behind the women; and as for the distance out of the window, where the knights pass, it has not the beauty that even Wilkie could give, in the little "Errand Boy" in another room, to so insignificant a feature as a distant rose-flushed cottage wall with a green water-butt set against it. The Pre-Raphaelites have proved nothing so much as that subject does not make great art, and that conscientiousness is not the chief virtue of the artist. Holman Hunt might fill a dozen more large books with his profession of their faith, himself as their high-priest and prophet-in-chief, and still could not make us discover in their pictures a beauty that had not been surpassed by the great masters—and some of the little masters, for that matter—who were to him no better than renegades and infidels. After the older work in the collection, the paintings in this series look weak and thin and empty.

It is in the chance for this comparison that I found my chief interest in seeing them at the Academy. Besides, there is the less need to dwell on individual examples because they have been so many times described—for instance, Rossetti's "The Beloved" and "Mnemosyne," and several of the small water-colors, really the best things he ever did; Burne-Jones's series of "The Princess Sabra." The Simeon Solomons hardly seem to me to justify the at-

tention this artist is just now attracting in London. His drawings, which are not exhibited, are better than his overworked paintings and mystery-laden, self-conscious water-colors.

Of the other paintings there is little to be said except that there is a fine landscape by Cecil Lawson, who was never in the Academy, and work by recent Academicians and Associates that ought to make the Academy do penance in sackcloth and ashes for the rest of its existence. There are some interesting things in the water-color room, among them a number of Turner's mountain peaks and mountain lakes, and here and there a delicate little drawing by artists like Fred Walker and Pinwell. The Black-and-White Room is devoted to a collection of drawings and sketches by Watts, studies for his pictures, which would have been more appropriately shown with the exhibition of his paintings last winter.

N. N.

OLD-AGE PENSIONS IN AUSTRALASIA.

SYDNEY, December 25, 1905.

New Zealand has just been the theatre of one of the most keenly contested struggles these colonies have witnessed. All Australia hung, breathless, on the late triennial general elections in the southern colony. Within the British Empire the sun rises earliest in New Zealand, and there (to borrow Daniel Webster's fine image) the drum-beat of State Socialism started, in company with it, on its journey round the world. The system on which the colony timidly embarked thirteen years ago, with the Socialist developments which Australia is day by day adopting from it, and which the Motherland, under the new Liberal ministry, may now begin to adopt, was on its trial. Industrial arbitration, old-age pensions, and the nationalization of the land were the chief bones of contention. Both sides made extraordinary efforts. In the preceding session the Government carried a number of Socialist measures. It increased the amount of the old-age pension by almost 50 per cent. It devised a large scheme of State dwellings for workmen. It legislated against Trusts. It proposed to augment by 50 per cent. the sum annually devoted to repurchasing private estates in order to provide small farms for the moneyless settler. Not content with these performances added to the long list of suchlike measures already on the statute book, the Cyclopean energy of the Premier was lavish in promises. He undertook to build 3,000 workmen's homes and (reviving an old idea of John Bright's) to provide "a free breakfast-table" in every one of them. He held out the hope that old-age pensions would yet be made universal.

The Opposition, for its part, showed no lack of resource. It created two more parties—the New Liberals and the Independent Labor party. It exposed the financial condition of the colony—the heavy burden its Socialism was laying on it in an indebtedness of sixty millions sterling, the pressure of taxation increased in ten years by a guinea a head, and the cost of living raised by at least 20 per cent. It recalled the "gagging bill" passed last session, by which freedom of speech on the platform was restricted. It denounced the despotism of the Premier who has for twelve years been governing New Zealand as Bismarck ruled Prussia, the slavery of the civil service, which must vote as he orders, and the reign of terror that is extinguishing every spark of independence throughout the colony. All its efforts were worse than fruitless; they recoiled on itself. The New Liberals were decapitated. The Independent Laborites were wiped out. The Opposition was almost annihilated. The Government majority of two to one was converted into a majority of more than three to one. By what seemed a virtually unanimous vote, the colony riveted on its own neck the yoke of its Socialist administration, its autocratic Premier, its moral enslavement. If it is in chains, it is in love with its chains.

A closer scrutiny gives a somewhat different complexion to the result. In round numbers, 200,000 males and females (for the suffrage is bisexual) voted for the Government, and 170,000 voted for the Opposition. Had 30,000 individuals voted differently, the relations of parties would have been reversed. Had an equitable method of voting been in use, the Opposition would have been returned with six-sevenths as many members as the Ministerialists, whereas it has less than one-third as many. An enlightened Minister vainly tried to introduce the Hare method into the colony, and similar unsuccess attended its attempted introduction into the Commonwealth; but it has for years been in force in the two chief towns of Tasmania, and the Tasmanian Government lately proposed to extend it to the entire State. Proportional representation is the dream of all liberals in countries where no constitutional limits are set to legislative omnipotence.

Though old-age pensions were a bone of contention between the rival parties at the late general elections, the contention was to determine which should have the most of it. The leader of the Opposition vied with the Premier in proposing to universalize them. There was no question of repealing the act creating them. The mere suggestion would have been fatal to the party making it. Those who are in the receipt of them, those who are looking forward to enjoying them, and all on whom both classes would be dependent, would have combined to defeat the proposal. The sentiment in Australia is almost the same. Though Tasmania, South Australia, and West Australia profess to be too poor to introduce them, no ministry would venture to abolish them in those States where they have been established. The retrenching Victorian ministry is at heart opposed to them, but all it has dared to attempt is to reduce the amount of the pensions and surround them with a variety of restrictions. The reforming ministry in New South Wales is no less secretly hostile, but it seeks only to lighten the cost of administering them, to sweep away abuses, and to expose the wrongful acceptance of them by individuals whose relatives are well able to support them. Queensland is about to introduce such pensions. Even the only free-trade ministry the Commonwealth has seen, though anti-Socialist on principle, was willing to enact a general system, applicable to all Australia, provided the various States would consent to the respective amounts being deducted by the Commonwealth treasurer from the proportion (three-fourths) of the customs duties returned to the States. The old-age pension is on its way to become a standing institution, permanently incorporated in the structure of the colonial governments.

Whether these adventurous colonies will be able to sustain the burden they are laying on their own shoulders, and by what means, are questions that are causing their administrators no little anxiety. More than twenty years ago, when the subject of old-age pensions was first broached, a pioneer Socialist minister toured New Zealand and expounded a plan for raising the necessary funds by means of voluntary contributions collected by the State and thereby made compulsory. That was on the model of the impracticable German system, which is even now advocated by moderate Liberals; but the tour was a failure, and the scheme could by no possibility have been a success. The more alluring Danish model has been deliberately adopted in both New Zealand and Australia. The principle of self-insurance has been ignored; all attempts to provide by special taxation for the consequent expenditure have been abandoned, and the outlay is being met from ordinary revenue. It is depleting, and in all the three colonies it far exceeds the original estimates. The various acts may, indeed, be affirmed to have been passed on false pretences, though it is doubtful whether the popular pressure could in any case have been resisted. In fact, the moment the bill was passed, a rush was made, and, for a time, till measures were taken to thin it, the crowd of applicants continued to swell. Were they all bona-fide, and such as the act contemplated?

Very much the contrary. The income-tax and old-age pensions together are making perjurers of a large portion of the population of Australia and New Zealand. A late Premier of Victoria admitted that there had been "some shocking cases of imposition." In New South Wales old and respected colonists are sent to prison for understating their income or their property. Others forge false declarations about themselves or the ability of their children to support them. In New Zealand the registrar states that "the extent of the imposition practised and the amounts obtained by unscrupulous persons are almost incredible." In 1902, and again in 1903, large sums were recovered, by legal proceedings or otherwise, from pensioners who had been paid under fraudulent claims. In 1902 and 1903 many were struck off the rolls. And here the writer may be permitted to correct an error of his own in the *Yale Review* for August, 1904. He there stated that it was now practicable to measure the curvature of the parabola described by old-age pensions in common with all other sociological phenomena. After only five years of the operation of the act, it seemed that the curve had reached its apex, and the diminution of the pension roll by the death of old pensioners exceeded its enlargement by the addition of new pensioners. It was a sanguine conclusion. It is a fact that in 1903 and 1904 there was a notable decline in the number of pensioners, but this was not owing to the deaths overtaking the additions to the roll. It was exclusively due to the excision of fraudulent pensioners. The pension roll

yearly lengthens, and the Premier of New Zealand estimates that the increase will continue for years to come.

Two recent amending acts have in various particulars changed the complexion of the system in New Zealand and New South Wales. On the eve of the general elections the Premier of New Zealand introduced a bill which the Opposition described as "a magnificent electioneering bribe." The first and most important new provision was that the amount of the pension was raised from £18 to £26 annually. Mr. Seddon asserted that, since 1898, when pensions were first granted, the cost of living, in house-rent, food, and clothing, had so materially increased that £26 would now go no farther than £18 did then. The admission, if it is well-founded, seems to be a condemnation of the legislation that has brought about the increase; but that is by the way. The prosperous southern colony, it must be allowed, has shown remarkable self-restraint in so long refusing to yield to pressure by augmenting the pension. With far less excuse, impecunious Victoria began by fixing the amount at £26, which a retrenching ministry afterwards endeavored to cut down to £17, but was compelled by the Legislature to raise it to eight shillings a week, or almost £22. In New South Wales, not then at the end of a long chain of annual deficits, it was from the first extravagantly fixed at £26. Even now a reform Ministry does not dare to reduce the amount, which may be considered as henceforth the unalterable figure in all the colonies.

New Zealand, a pioneer in all social innovations, sound and unsound, has been the first to face the issue involved in the granting of old-age pensions. Is the pension a right or a dole? If it is a right, then all persons over sixty-five years of age, who have resided in the colony for twenty-five years, are entitled to receive it, and a late Minister for Works in New South Wales asserted that it is a right; but no other leading public man has ventured to take the same advanced ground. As already stated, the leader of the Opposition in New Zealand proposes that the difficulties arising from the necessity for discriminating between fit and unfit claimants should be obviated by making the pension universal, and the Premier looks wistfully in the same direction, but is scared by the vision of the enormous burden that would thus be laid on the shoulders of the colony. Successive purgings have brought down from 42 to 35 per cent. the proportion borne by actual recipients of pensions to those qualified by age and residence to receive them, but the registrar professes to be unable to forecast the numbers that would be thrown on the rolls should a period of industrial depression succeed the present somewhat factitious prosperity. General destitution would then make the pension practically universal.

The declarations of Australian Premiers on the character of the pension are uncompromising. A late Premier of Victoria averred that to call it anything else than a charity was mere "sentimental moonshine," and the Victorian Government has retrenched its pension roll by one-fourth on the score that the relatives of 4,000 of its pensioners were in a position to support them. The Premier of New South Wales asserts that a pension granted only to the necessitous cannot be described as other than a charity, and a chief feature of his amending statute is the machinery created to test the eligibility of applicants. He refuses to make it obligatory on near relatives to maintain a pensioner or a claimant, but great powers are conferred on the officers administering the act to make searching inquiries into all the circumstances of the applicants. A special clause gives effect to the avowal of the Premier that, if applications for pensions are made in open court, there will be an incentive to wealthy persons not to leave their poor relations unprovided for. In introducing the bill Mr. Carruthers (the first native-born Premier New South Wales has had, and the head of the first ministry consisting entirely of natives) gave ludicrous accounts of the well-to-do class of persons who have been literally enjoying pensions, and he confirmed the statement of his predecessor in office, that thousands whose relatives are well able to support them are in receipt of pensions. No feeling of pride deterred them from accepting their ten shillings a week. On the contrary, not a few individuals are proud of being pensioners, though it is doubtful if this sentiment will survive. They certainly must not be confounded with paupers. The intention of the act was, like the Danish system, to supply an honorable provision for superannuated wage-earners such as shall not be in the nature of poor-relief. The two categories, of pauper and pensioner, are quite distinct, and, so far are the pensions from having diminished the amount expended in State charitable aid, as it was claimed would be the case, that the two are mounting side by side. Perhaps the pension might be described as a cross between an equity and a charity. J. C.

Correspondence.

BLACK VERSUS ITALIAN LABOR.

To the Editor of The Nation:

Sir: May I be permitted to point out what appears to me to be an injustice, unintentional no doubt, in the account of the recent meetings of the American Economic Association at Baltimore, in the *Nation* for January 18? In speaking of the last session, devoted to the "Economic Future of the Negro," your correspondent sums up the papers and discussions in the following words:

"On the one hand, the black was shown to be a thrifty, reasonably industrious peasant, whose standard of life rises rapidly under favorable conditions; and on the other hand, he was characterized as a besotted degenerate, from whom neither progress nor even stability may be expected."

In so far as the second part of this statement is intended to apply to the leading paper of the session, that by Mr. A. H. Stone of Mississippi, it seems to me a most unfortunate misrepresentation. Mr. Stone took for his subject "The Factor of White Competition," and, after briefly showing how white labor has prevailed in Northern cities, he took up the question of white competition as a possible factor in Southern agriculture, where until recently the negro has been supreme. After showing that, during the ten years covered by the last census, the negro has lost ground slightly, he set forth the results of competition during the last seven years between Italian and negro labor on a large plantation at Sunnyside, Arkansas. The results were so marked in favor of the Italian that an inquiry into the causes of the negro failure was in order. These are to be found in well-known traits and habits. To quote Mr. Stone's words:

"Too much time spent out of his crop; too much putting off to a more convenient season; too much waiting for the weather to improve; a too constant and a too successful besieging of those in authority for money accommodations and supplies; too little reckoning against the future day of settlement; too much 'leaning on the Lord,' and too little upon himself in things not spiritual; too much living for to-day and not enough for to-morrow."

From the point of view of the planter, the greater efficiency, thrift, and, above all, reliability of the Italian make him more profitable as a laborer. Yet Mr. Stone pointed out that, on his own plantation, Dunleith, with negroes only, he had been able to make as good a showing, so far as the crop was concerned, as had the owner of Sunnyside with Italian labor. This was not due to difference in soil, for there is practically no difference, but to what he described as "about the most paternalistic system of plantation management since the war." Showing thus that it was possible for negro labor, closely supervised, to compete with white labor, little supervised, he pointed out that the negro could not hope always to be shielded from the full effect of white competition. He said:

"I do not believe it will ever come to me to do them [the negroes] a greater service than now, if only my voice could reach them, by telling them that here is the only key to the safety of their future economic position; it lies in arresting the growing agitation throughout the South of the movement for foreign immigration—by removing its cause. I believe the negro still has it in his power to do this, at least in large measure, by making of himself an efficient and dependable factor in the economic life of the South? I believe he *can* do this, but will he? It would mean a revolution in the present social and industrial life and habits of the masses. To me the outlook for such a course does not seem encouraging. It will be a slow process of attrition, when it really comes, the working out of the results of competition. It will not be attended by any sensational features. There will be nothing sudden about it nor will it mean the extinction of the negro as an economic factor. It seems to me that its effect will be merely to submerge the incompetent mass, and elevate in that very process such as can weather the storm."

It is true that Mr. Stone's view is not that of the blind optimist who judges the negro masses by the talented tenth; but it is equally remote from that of the blind pessimist who regards the negro as a "besotted degenerate, from whom neither progress nor even stability may be expected." Mr. Stone has proved himself so truly the friend of the negro, both on Dunleith plantation and in his spoken and printed utterances, that it seems to me only fair that when his attitude is, however unintentionally, misrepresented, some corrective statement should be made. W. G. Leland.

Carnegie Institution of Washington,
January 27, 1906.

Notes.

Persons having letters of important bearing upon the life and work of George Bancroft, the historian, are requested to communicate with M. A. DeWolfe Howe, 26

Brimmer Street, Boston. Originals will be carefully copied and returned. The Bancroft family have placed in Mr. Howe's hands all the collected biographical material for an authoritative Life and Letters.

Macmillan Co.'s spring announcements embrace 'Napoleon and his Times,' in the Cambridge Modern History Series; the second part of Thomas Hardy's drama, "The Dynasts"; Stephen Phillips's new play, "Nero"; 'The Development of Shakspere as a Dramatist,' by Prof. Geo. P. Baker; a 'Life of John Wesley,' by Prof. C. T. Winchester; 'The Cyclopædia of American Agriculture,' edited by Prof. L. H. Bailey; 'Tarry-at-Home Travels,' by Edward Everett Hale, with illustrations; 'Mars and its Canals,' by Percival Lowell; 'Wireless Telegraphy and Telephony,' by Prof. Domenico Mazzotto; 'The Manufacture of Wine,' by Paul Pacottet; and 'India,' by Flora Annie Steel.

'Great-Grandma's Looking-Glass,' a poem by Blanche Nevin, with full-page silhouettes by Annis Dunbar Jenkins, is announced by Robert Grier Cooke.

A slavish following of our practice of letting the name of the English publisher of an English book precede that of the American led us, in the title-page caption to our recent notice of Miliukoff's 'Russia and its Crisis,' to imply that the Chicago University Press was not the original publisher. Our attention has been called to this by the Press. The book-buyer may have no quarrel with us, but the bibliographer has grounds for one.

In a notice of the 'Further Recollections of a Diplomatist,' by Sir Horace Rumbold, we indicated the probability of another volume to complete the series, and it has now appeared under the title of 'Final Recollections of a Diplomatist' (London: Edward Arnold). The story of diplomatic life is brought down from 1885 to 1900, and covers Sir Horace's experiences at Athens, The Hague, and Vienna. His account of these courts and of the leading personages attached to them is mildly interesting, but leaves the impression that diplomats have very little to do except attend balls and other social gatherings. Possibly it was an excessive interest in these serious matters that delayed Sir Horace's diplomatic promotion, or it may have been a suspected incapacity for the lighter labors of diplomacy. Whatever the cause of this delay, Sir Horace considers that his merits were not properly appreciated by the Foreign Office, and he winds up his story with another grievance—that a retired diplomat is nobody at all.

> "Ci git Piron, qui ne fut rien,
> Pas même Académicien."

Another book of "water-colors and pen-and-ink sketches in India," which is remarkable more for the pictures than the print, lies before us, 'The High-Road of Empire,' by A. H. Hallam Murray (E. P. Dutton & Co.). It recalls agreeable memories to one who has travelled in that country, and contains chiefly pictures of well-known places such as the bathing-ghats of Benares, views of Agra, etc. Less familiar are the Bijapur sketches and views of Jodhpur. The aged author relates that he was easily able to leap across a stream ten feet wide—a somewhat unusual effect of the enervating climate of India. The text is pleasant, gossipy talk, with a due modicum of history and archæology.

The 'Memoirs of Catharine Grace Loch,' Senior Lady Superintendent of the Royal Red Cross in India, edited by A. F. Bradshaw, M.A., with an introduction by Lord Roberts (Henry Frowde), is a tribute to a cheery and brave soldier of the cross, who united executive ability with the "faculty of inspiring affection," as the editor says. She was a pioneer in the excellent work done for the soldiers of the crown in India, and her premature death after a few years of service left vacant a post difficult to fill. The memoir is largely autobiographical, being drawn from her letters and diary, and gives a very real picture of the conditions under which the work was carried on, as well as an insight into the noble character of this modest heroine of peace.

The fifth volume of the translation of Jātakas, begun under the editorship of the late Professor Cowell (Cambridge, Eng., University Press; New York: Macmillan), will be welcomed by all students of folklore to whom the original text is a closed book. The present translation is by H. T. Francis, who did part of the translation for the third volume in the same series. R. A. Neil, who assisted Mr. Francis in the former translation, died in 1901, leaving the whole burden upon the shoulders of the latter scholar. This accounts for the long delay in the appearance of the fifth volume, which includes books xvi.-xxi. (Jātakas 511-537), bringing the translation up to the end of the same volume of the text. The latter appeared in 1891. Another volume will see the whole excellent work completed.

The article of greatest general interest in the *Geographical Journal* for January is the Rev. Walter Weston's account of his travels in the Southern Japanese Alps. His descriptions of the wonderful scenery are illustrated by some remarkably fine reproductions of photographs. Of the peasantry he says that their simple, unaffected politeness and kindly hospitality leave the most delightful memories behind, while their honesty is demonstrated by the fact that in fourteen journeys among them he has been robbed but once. He had frequent opportunities of observing how their habits of life prepared them for the hardships and privations of the Mantchurian campaigns, as well as developed self-restraint, patience and resourcefulness. Their social organization is extraordinary, each village headman having a rough map of his district and being able to furnish the minutest information of the circumstances of any given family. What their powers of endurance are may be gathered from the statement that in Kofu, one of their most progressive towns, some of the silk filatures employ several hundred persons, chiefly young girls, whose hours are said to be fifteen per day, without a break for meals, or even a Sunday holiday, and this continues all the year round, with the exception of two months in the winter. The exploration of the Beaufort Sea, lying to the north of Alaska, is advocated by Sir C. R. Markham. It is the least-known part of the Arctic region, and the hoped-for discovery of land on the edge of the polar sea would solve an interesting geographical problem. The account of canal irrigation in the Punjab shows a wonderful achievement. On a tract three times as large as Rhode Island, which a few years ago was an uninhabited waste used only for grazing, are now raised annually crops mainly of wheat, oil seed, and cotton valued at $20,000,000. The paper read by Prof. W. M. Davis at the Johannesburg session of the British Association, entitled "The Geographical Cycle in an Arid Climate," is a study of the phenomena presented by the deserts of the world.

The report of the Librarian of Congress shows the Copyright Office up to date in the handling of its vast business, so profitable to the Government in cash profits and in the books and other articles secured for the Library. The Manuscripts Division has outgrown its cabinets, which must be doubled. Apropos of the recent acquisition of some Franklin Pierce papers, it is stated that "in 1901 the Library possessed the papers of no President of the United States. It now holds the papers of Washington, Jefferson, Madison, Monroe, Jackson, Van Buren, Polk, Pierce, and Johnson. Breckinridge and Crittenden papers mark a notable increase in the Southern collections. In literary MSS., the Library is defective. The St. Louis Exposition contributed handsomely of its spoils to the Library, by international comity, as usual. Two appendices are given up to lists of prints from the Chalcographie du Louvre and of facsimiles of copper and wood-engraving of the old masters from the German Reichsdruckerei—more comity. The Librarian states that an international agreement on the subject of cataloguing is almost in sight.

It is a reasonable inference from the care lavished upon its catalogue to the ideals and standards of a publishing-house. The 'Portrait Catalogue' just issued by Houghton, Mifflin & Co., is a more than fair example of the work of the Riverside Press, and is a desirable possession in itself. It is not the first of its class put forth by this firm, but it stands at the head in point of beauty of manufacture, without and within. The title-page alone is enough to stamp the quality of the Riverside bookmakers. It is beautifully invented. The portraits, domestic and foreign, are very numerous, and there is a brief history of the firm, with accounts of the several departments. The evolution of the title-page device is curiously illustrated at the close. The "Riverside" has been completely eliminated from Vedder's original conception.

Berlin papers report the establishment of a German-American literary "Vermittlungs-Bureau," called "The European Literary Bureau," with headquarters in Berlin W., Motzstrasse 41. This establishment represents American book and periodical publishers, and has for its special purpose to act as an agent between American and German publishers. Even in cases where it cannot undertake the handling of manuscripts, it aims to secure the rights of German authors and publishers in the United States, taking advantage of the law passed March 3, 1905. The bureau has also dealings with English and German theatres, and undertakes to handle plays in either country. Financially, it derives its support from the American participants, so that German authors and publishers are put to no expense if one of their books or theatrical plays is reproduced in this country.

In order to assist impecunious students in working their way through the univers-

ity. *Arbeitsämter* have been established, not by the university authorities, but by volunteer students' associations, in all the leading university towns of Germany. They offer to students of all nationalities and religions the opportunity of earning money by tutoring or becoming *Hauslehrer*, by assisting in collecting data for scientific researches, excerpting and transcribing documents, preparing indices, proof-reading, and the like. The services are free of cost to all applicants, and are rendered by volunteers from the students' associations.

According to the *Frankfurter Zeitung*, the philosophical faculty of Giessen has decided hencefortb to issue its diplomas in the German and no longer in the Latin language. We believe this is the first instance of sucb an innovation by a German university faculty. The *Zeitung* expresses the hope that the bombastic exaggeration wbich the doctor diplomas inherited with the Latin will also be discarded, as nowadays the average doctor is anything but a *vir doctissimus*. With this change another piece of mediæval *Zopf* in academic life becomes a thing of the past.

A report comes from Rome that the Central Commission for Antiquities and Fine Arts, by a vote of seven to four, has decided to take up for serious deliberation the proposal of Professor Waldstein to establish an international association for the purpose of engaging in the excavation of Herculaneum.

In the *Mitteilungen* of the German Orient-Gesellschaft, the leader of the German expedition, Dr. Koldewey, reports a discovery of great importance for the topography of the city of Babylon, and for the location of the castle of Nebuchadnezzar. This is the famous Arachtu canal, so often mentioned in the inscriptions. News is also given of the work only recently undertaken by the Society in examining the ruins of synagogues in Galilee, in charge of the three savants, Kobl, Watzinger, and Hiller. A work is thus for the first time being done that Ernest Renan so warmly pleaded for more than forty years ago, as these synagogues are of great importance from the standpoint of architecture and the development of civilization in Palestine. How urgent the undertaking was, may be judged from the fact that a number of such sites, reported only a few years ago by various travellers, have now entirely disappeared, and the commission could report on only eleven remains, but all instructive specimens of their kind.

The Protestant College at Beirut, Syria, is remarkable among similar institutions for several reasons. Founded thirty-nine years ago by Dr. Bliss, with three rooms and ten students, it has now, says a writer in the *Churchman*, numerous and spacious buildings costing half a million dollars, and 736 students. The number would be much larger, many applicants for admission being refused, if it had funds for more land, buildings, books, and apparatus. Seven-tenths of the cost of instruction is borne by the students themselves. Its cosmopolitan character is shown by the fact that thirteen nationalities are represented in it, and, all race prejudices being laid aside, are working harmoniously together. In the preparatory department, English is taught, as it is the medium of instruction in the Schools of Commerce, Medicine, Biblical Archæology, and Philology, though Arabic, Turkish, French, and German are taught also. The distinguishing characteristic, however, is the catholic spirit with which the college is administered, so that the members of twelve distinct churches or religious bodies are to be found in it. Incorporated under the laws of the State of New York, it is independent of the missionary organization of any church, being one of the leaders in practical federation, welcoming and finding the coöperation of all.

Mr. Ellsworth Huntington, the American traveller, well known for his remarkable journey through the Great Cañon of the Euphrates, is engaged, together with another American, Mr. R. L. Barrett, in an exploration of the Tarim Basin in Chinese Turkestan. From a dispatch summarized in the London *Times*, we gather that the summer and early fall of 1905 were spent in studying the river system in the southern part of this region, with a view to supplementing the work of Dr. Sven Hedin in elucidating its physical history. The resemblance of the basin, with its sand waves, huge shingle beach, and green tide-flats, to an inland sea is striking, and, but for the absence of water, it would be a genuine Mediterranean. The ruins of ancient villages were found to be considerably more numerous and to cover a much larger area than had been expected. Three new sites were discovered, of which the farthest in the desert must have been once the centre of a large agricultural population. The abandonment of these places was due, according to local tradition, to the failure of the water supply, which, if correct, would indicate the gradual desiccation of Central Asia in historic times. This winter Mr. Huntington proposes to study the Lop Nor region, and in the spring to visit the curious Turfan depression to the north.

The statement, made in this journal several years ago, that, since the introduction of tables and chairs, systematic physical training for all, improved diet, etc., in Japanese schools, the legs of the new generation had lengthened a half-inch, was challenged. The proofs that the Japanese are growing taller are ample, as shown by the reports of the army surgeons, who in 1892 examined 348,337 men applying for enlistment, and in 1902 431,093 men. At the former date, the number in stature below 5 feet was 20.17 per cent.; in 1902 the percentage had fallen to 16.20; and that of men below 5.2 feet, from 37.93 to 36.07. Between the same dates the percentages were, of men 5.4 feet and over, 10.06 and 12.67; and of men between 5.2 and 5.4 feet, respectively, 31.84 and 35.06. The change of the national fashion from sitting, often for many hours, on hams and heels to chairs, and the introduction of habits of physical exercise for all classes during the growing period, dates from 1870, when the first of the 1,200 or more American and other foreign teachers began the modern system of education in Japan. Enlarged data on this point will be among the results of Japan's putting a million of men in arms during the struggle with Russia.

—The edition of 'The Poetical Works of William Blake,' which has been prepared for the Clarendon Press (H. Frowde) by Mr. John Sampson, is, in point of laborious research and painstaking arrangement, one of the most admirable pieces of editing that we have lately seen. The text of Blake's poetry, owing to his peculiar method of publishing, or not publishing, is of a special complication, and the matter has not been greatly helped by the proneness of previous editors to evade rather than master difficulties, and to make Blake write what they think he ought to have written rather than what he actually did write. Mr. Sampson preserves for the first time the integrity of the sources. He gives the poems in the Rossetti MS., the Pickering MS., etc., each in a group by itself instead of lumping them under the customary but quite arbitrary title, "Ideas of Good and Evil"; and what is more important, he prints Blake *verbatim et literatim*. We find, for example, many curious bits of spelling, capitalization, and punctuation like

"Tyger! Tyger! burning bright."

that greatly enhance the weirdness and intensity of Blake's intense and weird imagination. The very copious bibliographical and textual notes which underrun the text are, perhaps, too minute and elaborate to be of service to any but the most devoted student, but Mr. Sampson's happy thought of printing in footnotes passages from the Prophetic Books illustrating the symbolism of the poems, will be helpful and suggestive to the less thoroughgoing amateurs of Blake. For a volume so intricate in substance, the book is uncommonly pleasant in typography. We have noted but a single slip, and that a pardonable and not unengaging one. On p. 76, a certain copy of the 'Songs of Innocence' is said to be in the possession of a fortunate gentleman residing in "Providence, N. Y."

—Since the appearance of Greenough and Kittredge's 'Words and their Ways,' we have met with no book of comparable scope so solid and so suggestive as Prof. Otto Jespersen's new work on the 'Growth and Structure of the English Language' (Leipzig: B. G. Teubner), or so likely to realize the Copenhagen scholar's ideal of profit at once to the layman and "the expert philologist." To the technical reviewers, very likely, chapter iv., "The Scandinavians," will prove most attractive, since it organizes, critically, the conclusions of such investigators as Björkman, Flom, and Brate, and, altogether, puts a new construction on Scandinavian influence in Old and Middle English. To the layman may be recommended especially chapters i. and ix. Chapter i. is "a rapid sketch of the language of our own days," as it strikes a foreigner—"a foreigner who has devoted much time to the study of English, but who feels that, in spite of all his efforts, he is only able to look at it as a foreigner does, and not exactly as a native would." Judged by the style of his book, Mr. Jespersen's sense for English idiom is not to be sneezed at. Yet, rating that sense at less than its actual value, and granting to the native the Dane's unusual linguistic training, we must still credit the "foreigner" with an immense superiority of perspective when it comes to a general characterization of our language. In comparison with other tongues, English, in its system of sounds, its rhymes, its concision, sobriety and restraint, its cadences, its sparing use of diminutives, its direct word-order, seems to Mr. Jespersen "posi-

tively and expressly *masculine*": "it is the language of a grown-up man, and has very little childish or feminine about it." In chapter ix. the time-honored statistics on the comparative richness of the vocabularies of Shakspere, Milton, and the day-laborer get a salutary shaking up, somewhat to the advantage of Milton and the day-laborer, and without injury to Shakspere. "It is easy," we read on page 214, "to prove that [Milton's] vocabulary really contained many more than the 8,000 words found in a Concordance to his poetical works. We have only to take any page of his prose writings, and we shall meet with a great many words not in the Concordance. The greatness of Shakspere's mind is . . . not shown by the fact that he was acquainted with 20,000 words, but by the fact that he wrote about so great a variety of subjects and touched upon so many human . . . relations that he needed this number of words." The whole book is full of interest.

—Mr. E. E. Soderholz, whose name is well known in connection with studies of the "Old Colonial" architecture in the United States, has illustrated, with the help of "others," a book on 'The Country House,' by Charles Edward Hooper (Doubleday, Page & Co.). It is not unfair to treat the illustrations as the most striking and suggestive part of such a book, although one is left wondering whether the selection of subjects and the judicious taking of negatives from them is "illustration" in any accepted sense. Here are an enormous number of really admirable details of existing houses —stairs, fireplaces, verandas, bay-windows, door-pieces, and the like, with, moreover, some scores of exterior views, generally with plans to match; and again views of outbuildings and of gardens and garden-houses, *perrons*, studies of rock-work, and the like. In short, here is a perfect iconographic encyclopædia of house-building and decorating; and even the end papers or linings of the volume are treated with photographic views—with two large landscape photographs showing in each case a pergola with vines, and such other accessorics as a large formal garden might present. The text is a serious analytic study, in which, for instance (chapter vi.), "Windows and Window Motives" are considered—the structure of the window sash and frame, its setting in the wall of the house, its modification and extension into the bay window, the oriel, and the like; all very intelligent and sufficiently complete. And in connection with this, another word about the illustrations seems in order—the unusual and really charming character of many of the subjects chosen. It is not to-day only that we note the easy superiority in the American community of simple domestic building and its appliances over the big and formal architecture of the state-house and court-house, the bank and the city mansion; but such a round bay window as that shown on page 109, and such a combination of porch and "Palladian [*i. e.*, Venetian] window" as we find on page 105, would at once recommend the book to the student. It is a small quarto in shape and appearance, containing 330 pages and at least 350 pictures.

—On the great subject of Shinto, the indigenous religion of the Japanese, Mr. Ernest Satow, formerly student-interpreter in Japan and now British minister in Pekin, wrote abundantly with profound scholarship, acknowledging at the close of his labors that the last word had not been said on Shinto, being himself uncertain as to its indigenous origin. Chamberlain suggested that its mythology of the Kojiki, or Book of Origins, had been inspired by Chinese legends, but neither professed to employ the comparative method, though Satow advised it. Happily for scholarship, one who has studied Shinto not only in its literary monuments and in the interpretations of aliens, but who has dwelt long on the soil and made direct and profound observations, has taken up the task, and part of his work is now in print. 'Le Shinntoisme,' by Michel Revon (Paris: Ernest Leroux), is a work of original research, in which the author, applying the theory of evolution and the comparative method, arrives at some results, scientific, original, and very important. So far from having its deepest roots in Chinese soil, as some have thought, Revon has demonstrated that the God Way is a spontaneous religion, and in most respects similar to all the other primitive religions, that the mythology of the Kojiki (now accessible in English and German) is autochthonic, and that the magic and myths of Shinto are connected with the oceanic religions. Dr. Revon was for a decade professor in the faculty of law in Tokio, and is now in charge of the course of history of the civilizations of the Far East at the University of Paris. His works on Hokusai (in French) and on the Flora of Nippon Archipelago (in Latin), and his monographs on modern Japan and on Japanese civilization, beside his text and copious references to authorities, show a keen observer as well as a student of the first books of importance treating of the Malay, Chinese, and Japanese worlds. He is well able to criticise those native scholars, like Hirata and Mabuchi, whose fanatical patriotism and anti-Chinese bias so often mar the conclusions of their genuine scholarship. Revon is possibly the first author in print, though not the first thinker on the subject, who has wondered how the very numerous oceanic myths of the primitive Japanese could be correlated to Chinese outlook and fancy. The Kojiki stories of origins are very largely those of the "blue plain of the sea" and of lands beyond the waves. Revon has shown clearly that these are allied to Malay lore. Complete demonstration of derivation from Malay origins may be given in the succeeding portions of this interesting study. Most fascinating is the author's notice of the many interesting survivals in popular customs. He demonstrates that phallicism was an organic part of the primitive Shinto system. This is the ablest contribution in recent years to the study of a religion which has struck its roots more deeply into the Japanese soul and national system than any imported from the Continent.

BAYARD TAYLOR.

On Two Continents: Memories of Half a Century. By Marie Hansen Taylor. With the Coöperation of Lilian Bayard Taylor Kiliani. Illustrated from Contemporary Portraits and Paintings by Bayard Taylor. Doubleday, Page & Co. 1905. Pp. xi., 309.

Few echoes of the recent past will be more acceptable to the student of American literature than this unpretentious volume of reminiscence, recalling the portly form, the winning voice and the restless activity of Bayard Taylor. In simple, direct narrative as charming as that of Andersen in 'The Story of My Life,' Mrs. Taylor tells of her childhood in the old town of Gotha, in "a by-gone time" when court-ladies sat knitting their stockings by the faint light of a candle-dip, and a young girl was thought clever if she but learned to keep house, acquired a smattering of French, said little in company, and never looked wise. Mrs. Taylor's father was the eminent astronomer, Peter Andreas Hansen, declared by Simon Newcomb "the greatest master of celestial mechanics since Laplace"; and, as affectionately sketched by his daughter, we see him stealing away from his young wife at a ball to solve an abstract problem, and forgetting to return, or surprised in his dressing-gown and slippers by a party of fashionable duchesses. From this typical, secluded German circle, the young girl set out on her first trip to Rome, and there, under the guidance of her uncle, Emil Braun, the archæologist, a friend of the Brownings, she revelled in the Eternal City of Goethe, with its "walking Caryatids," until she found "the home of her soul."

Returning to Germany, Marie Hansen met Bayard Taylor first in 1851, on his way back from the Orient, where he had fallen in with her uncle, Bufleb, on the Nile. Beneath the starry skies of Egypt the affectionate German told the traveller of his niece at home, and she in turn learned from her uncle how the wandering American was seeking to recover from the loss of his first love, to whom he had been wedded but shortly before her death. Five years later, Taylor reëntered the little cottage provided especially for him at Gotha; but "as he did not know how to carry on a courtship," his relations to the German maiden "remained on a footing of simple friendship." The winter of 1856-7 found Taylor in Sweden and Lapland, but in the budding month of May he came back to Thuringia, and a few days afterward he and Marie Hansen were engaged. A trip to the Land of the Midnight Sun postponed the marriage in Castle Friedenstein until September 27, 1857, when, through Taylor's wit, the court *Prediger* proclaimed him "Landowner and Citizen of the United States," and then the young couple made a visit to London and a tour of Greece. In the following summer they returned to Gotha to reside until their only child, Lilian, was born, and two months later all three sailed for the New World.

The story of Mrs. Taylor's early experiences in America, told with rare candor and engaging modesty, presents her as a large-hearted, affectionate, patriotic woman, tactfully adapting herself to the new environment among her Quaker relatives in the home of Penn. Journeying from New York to Wilmington by rail, and thence fourteen miles by buckboard over rough roads to Kennett Square, Bayard Taylor and his family were welcomed to a table laden with ham, roast-beef, vegetables, preserves, and pie, all crowded together; and, after glorious autumnal days, Mrs. Taylor decorated the first Christmas tree set up in that part of America. Now and then the plucky wife accompanied her

husband on his lecturing tours, in 1859 going even to California by way of the Isthmus, a perilous but "wonderfully beautiful voyage"; and, again, she remained alone courageously long weeks at home, while the overworked lecturer toured the sparsely-settled country. The civil war, too, stirred her inmost soul; she led the women of her neighborhood in preparing supplies for the soldiers, she guarded her home from marauders incensed by Taylor's connection with the *Tribune*, and she ventured with her husband, in his capacity as war correspondent, almost on the field of battle. Vivid and full of local color are the letters of the young wife to her anxious relatives on the fall of Richmond, the surrender of Lee, and the assassination of Lincoln; and equally absorbing are the tidings of the great struggle between Germany and Austria sent by the aged parents from Gotha, to the borders of whose township the theatre of European war had changed. The decisive move at Königgrätz, and the beginning of Bismarck's brilliant career, showed Mrs. Taylor how thoroughly German she had remained; while the tremendous victory of the Germans in their life-and-death struggle with the French was celebrated by the poet as well.

All in all, however, the years passed pleasantly with the Taylors in their new and spacious "Cedarcroft," designed and erected by Taylor near the scene of his birth and amid the staid old Quakers, whose sterling merits both the alien Bayard and his German wife appreciated. Of modest tastes, Taylor's chief extravagance was books, pictures, flowers, and an overpowering hospitality that brought guests from near and far and kept them for weeks, not to mention the neighbors who tarried so long under the welcoming roof that there was nothing else to do but to put them to bed! Taylor came to number Longfellow, Bryant, Whittier, Emerson, Lowell, and Alice and Phœbe Cary among his friends and guests, and other Americans whom he often entertained at "Cedarcroft" were Putnam and Fields, his loyal publishers; Willis, his early patron; Mrs. Botta and Susan Warner, the eloquent young Curtis, Boker and Furness, the steadfast Greeley and his eccentric wife, Edwin Booth, Aldrich, Bret Harte and McEntee, J. L. Graham, Sidney Lanier, Stedman and Stoddard, who called the company of poets, artists, and authors thus gathered together "a nest of singing-birds." In the meanwhile, Taylor and his wife crossed and recrossed the ocean, now spending a night with Tennyson at Farringford, then sleeping in the room occupied by Goethe at Ilmenau, and again enjoying the hospitality of the Grand Duke of Weimar, and so came in contact with many representative Europeans. These chance acquaintances or more enduring friendships afford the author studies of the Poet-Laureate, the Brownings, Wolf von Goethe, Thackeray, Rückert, Barry Cornwall, Swinburne, Garibaldi, Freytag, Bismarck, Auerbach, Karl Witte, Preller, Tupper, Schiller's grandson (Von Gleichen), Lord Beaconsfield, and Alexander von Humboldt, who told Taylor that he would politely try to live until he should see the daughter of Hansen! Once Taylor went to St. Petersburg as *chargé-d'affaires*, assured that, upon the retirement of Mr. Cameron, he should be given the post of minister, and there are spicy recollections of court life among the affable Russian nobility, the cordiality of the British Ambassador, Lord Napier, and his wife, who studiously avoided any reference to the War of the Rebellion, and the marked coldness of the German legation. "If I had been an American born," says Mrs. Taylor, "the diplomatic corps would have approved of me to a greater degree; but as a German, and not of the nobility, I was a stumbling-block in their path which could not be ignored on account of my husband's official position." On the strange conduct of Secretary Seward, however, in promising Taylor the mission to Persia, and then leaving him to wait for months in Europe while Lincoln thought that he was at the court of the Shah, Mrs. Taylor throws no new light, probably because nothing further is or ever will be known in the matter.

Time, reverses, and toil worked a baneful influence on Taylor's dreamy and hopeful nature; little by little "Cedarcroft" proved a greater burden than even his broad shoulders could bear; and, to the sorrow of many, the poet and his wife bade good-bye to the pleasures of country life, and began that restless existence in the grinding metropolis which was later to hurry Taylor so swiftly to his fate. "We made mistakes," says Mrs. Taylor, referring to their venture at Kennett Square, "that we were afterward obliged to atone for as the way of the world demands. And yet, what mattered it in the end! If men and women can be happy, we certainly were." "The heavy burden of journalistic slavery dropped from Taylor's shoulders" when he became Minister to Germany, "but other demands were made upon his strength which were by no means salutary." Entering upon his high office when already stricken with a fatal disease, Taylor hastened his death by devotion to General Grant, who was then touring the world and had reached Berlin. In the Prussian capital, on December 19, 1878, Bayard Taylor breathed his last.

Taylor's personality, as portrayed by his wife, is natural and attractive. He is affectionate to his kin, taking his brothers and sisters and parents to Europe, and selling a share of *Tribune* stock to equip his younger brother for a captaincy in the Union army, and he is devoted and tender as a husband and father, playfully giving his wife a watch hidden in a hat-box, and writing to his little daughter rare descriptions of Indians and "back-woods" natives met with on his lecturing tours. His wit and humor come to his aid when beset by bores, whom he coughs away, intimating the prevalence of a contagious disease; his patriotism is evidenced by the defence of country and home; and the veil is partially lifted from his real religious views, the evolution of which had been but intimated in his poetry. He is *par excellence* a linguist, delighting the Czar by his rapid acquisition of Russian; he works prodigiously at prose, wearing himself out in the service of the *Tribune*; as a lecturer he is "not a born orator, but has adapted himself to the profitable temporary profession because it is demanded of him"; he sketches the Acropolis and the canals of Venice, sets up a studio at Rome or whiles away Sundays in the country painting the beauties of hedge or lawn; while as a poet with ideals as high as those of "*Deukalion*, a type far superior to all other men," he displays facility in both English and German, writing sixteen stanzas of "St. John" at a sitting, and translating six lyrical poems as part of a long review of two volumes of Hugo made in a single afternoon and evening. With all his poetic spirit, however, he is dominated for some time by a former task; he chafes under the restlessness of American life, and he cannot talk to others of his ideas until they have ripened into form. Little by little we see the "Faust" taking shape in English, a "heart-rending, but fascinating" toil, the poet making "innumerable drafts of the Song of the Spirits" alone, while his gifted wife follows with the original before her eyes; his tribute "An Goethe" is submitted for criticism to Gustav Freytag, who finds it "cast in a single mould of true German spirit and German feeling, and needing no improvement." We are sadly conscious of the peculiar gifts which Taylor possessed for a Goethe-Schiller biography, and the facilities—unequalled at that time—assured him by the Duke of Weimar and the scholars of Germany; and we see only too well that, had he settled down to that great work and said nay to the Muse that "came, returned, and would take no denial," we might to-day boast a sympathetic interpretation of the Weimar Duumvirate such as graces no literature.

Nearly half a century of stirring life passes along these 'Two Continents' of Mrs. Taylor, illustrated by the unique portraits of Taylor, Hansen, and Bismarck, and annotated with clever translations by the poet's daughter; and yet it would be delightful to hear more of Taylor's wooing, to know Marie Hansen's part in his literary development and in his masterpiece, the "Faust," and to gaze longer at the bedside of the poet expiring in a foreign land. There is also less about Longfellow and his friendship with Taylor than might be expected, there is no mention of Lowell, nor is there any reference to Taylor's lecture in German on American literature at Weimar, where the story of an eye-witness would be very acceptable. But the volume brings much that is new, and what was previously known has been well retold. There is, in general, a wise discrimination as to content, and the whole work shows the value of that lost art—the keeping of a diary.

THE FIRST EARL OF DUDLEY.

Letters to "Ivy," from the First Earl of Dudley. By S. H. Romilly. Longmans, Green & Co. 1905.

John William Ward, first Earl of Dudley, escaped greatness by so narrow a margin as vividly to recall Dryden's line regarding the close alliance between genius and madness. Unlike the Earl of Peterborough, whose brilliant successes during the War of the Spanish Succession took England by storm, he was neither a soldier nor a man of abnormally energetic temperament. The affliction which clouded his life and almost nullified his extraordinary gifts, was an undue sensitiveness of temperament arising from an organic cause in malformation of the brain. Otherwise, he possessed almost every advantage of rank, intellect, and character. He had high birth, great wealth,

noble alms, great intellectual acquirements and power of application. Nothing but uncertain health and the same sort of fastidiousness which baffled Lord Acton seems to have stood in his way. Had the gods who gave him so much but given a little more, he might have vied in politics or literature with almost any of his contemporaries.

Such, at least, is the impression one is bound to form of Ward's qualities from the statements which were made about him by those who were quite competent to appreciate his parts. Even the *Quarterly Review* and the *Edinburgh Review* could unite to praise him.

"Fulfilling Lord Bacon's grand recipe," says the *Quarterly*, "his reading made him full, his writing exact. His wit was prompt, sparkling, and epigrammatic; it was playful and indulgent, not, however, from weakness; it was the giant's strength which could afford to be generous. To all these qualities of the head was superadded a gentle and affectionate disposition, a freedom from pride and vanity, a simplicity of habits and tastes—in a word, all the striking features of that noblest of creations—a real English gentleman."

While the *Quarterly* could speak thus, Brougham in the *Edinburgh* was not to be outdone:

"He possessed one of the most acute and vigorous understandings that any man was ever armed with. His quickness was not accompanied with the least temerity; on the contrary, he was as sure as the slowest of mankind. His wit was of the brightest order, combining with the liveliest perception of remote resemblances and mere distinctions . . . all that nice relish of the ludicrous, especially in character, out of which perfect humor is engendered. . . . And it was none of the least enviable of his great qualities that, in union with all these endowments, and in spite of that fortune and station usually so inimical to laborious pursuits, he possessed the faculty of intense application, passing his life by preference in the study, and having acquired the habits of unremitting intellectual labor as completely as if he had been born a poor man, by necessity become a student, gifted with a slow understanding, and at once devoid of fancy and acuteness."

These words from the lips of his contemporaries will serve to give Lord Dudley his place among the élite of Englishmen during the age of Castlereagh and Canning. For the rest, it may be said that his temper was so fastidious that any literary remains saved from the wreckage of his life must awaken curiosity if they do not end in eliciting admiration. There is not even an oil portrait of him, and the one pencil drawing—that by Slater in the rooms of Grillion's Club—is said to have been crunched up, put in his pocket, and long supposed to have been destroyed. It shows an extremely refined and intellectual face, such as any artist might have been delighted to portray. It is true, there already exists in print a portion of Ward's correspondence with Bishop Copleston, his college tutor; but this collection of letters created a sense of disappointment from the formality of its tone and its failure to reveal the charm and power which the writer undoubtedly possessed.

> "Than the first Martyr's Dudley's fate
> Still harder must be owned;
> Stephen was only stoned to death,
> Ward has been Coplestoned."

Apropos of the foregoing epigram, Mr. Romilly observes: "This was certainly hard luck upon the man of whom no less an authority than Madame de Staël has said that 'he was the only man in England who really understood the art of conversation.'"

The "Ivy" of these letters was Mrs. Dugald Stewart of Edinburgh, in whose house Ward had lived for some time during his early years. Concerning Mrs. Stewart's personality little need be said here, save that she had a degree of attractiveness which made a host of eminent people her lasting friends. Sixteen years older than Ward, she had at first given him the affectionate care which, through his mother's neglect, he had never known at home. The whole correspondence is couched in a tone of familiarity blended with real deference, and is wholly unlike the stiffness of Ward's style in his correspondence with Copleston. It was long believed that Mrs. Stewart on her death-bed destroyed the whole of Ward's letters to her; but, though she probably did burn some of them, a great many were preserved, either in the original holograph or in a careful copy. Mr. Romilly, the present owner of them and also the editor of this volume, received them on the death of a relative who, as a child, had been brought up in Mrs. Stewart's family. It was only two years ago that chance led him to open the manuscripts and familiarize himself with their contents.

The correspondence here published runs parallel during the greater part of its course with the 'Creevy Papers,' and covers some of the ground traversed by the first volume of Greville. Ward was a far abler, more acute and more scholarly man than either of these contemporaries, and in his more detailed letters reaches a height to which neither of them attained. As an historical record, the main defect of the papers now printed by Mr. Romilly must be found in their disconnected and sporadic character. There are considerable breaks in the chronology, and no single topic is so fully illustrated by them as is the nature of Whig politics in the 'Creevy Papers.' Ward had an intellectual disinterestedness which kept him from becoming a party hack, and, though he ended his political career by being Foreign Secretary under Canning, he had passed through the stage of moderate Whiggism, and could even admire the genius of Napoleon without being in the least swayed by patriotic prejudice. For example, his letters from the Continent after the Emperor's first abdication are filled with cordial eulogy of the great public works carried out under Napoleon's care; and once, when Metternich asked him at dinner what he thought about Napoleon himself, the answer was: "Mon Prince, je ne suis pas militaire, mais il me semble qu'il a rendu la gloire passée douteuse, et la renommée future impossible." And, apropos of epigrams, to Ward may be ascribed more truly than to Lord John Russell the saying that the cant of patriotism is not so bad as the recant.

Although we find it impossible to make this notice include passages from Lord Dudley's letters which would give an adequate impression of their style, we must state that the book contains a good deal that would stand separation from the context. Ward's sub-satirical strain is very pleasant, for, without striving after effect, he can be witty, and his wit is not ill-natured. While far removed in both conception and manner from the 'Etchingham Letters,' the tone of Dudley's correspondence is not unlike the clever trifling one gets from Sir Frederick Pollock and Mrs. Fuller Maitland. Speaking broadly, one-third of the letters may be called unimportant, since they are but hasty notes illustrating merely the writer's filial affection for Mrs. Stewart. The other two-thirds consist of moderately long epistles—epistles, at any rate, which are long enough to disclose the nature of Ward's tastes and mind. The representative passages that we are unable to cite, include a remarkable scene between Ward and Lady Caroline Lamb (pp. 95-98), the whole series of letters from Italy and France (pp. 262-301), and the appreciation of Canning (pp. 325-328). So far as the architecture of a house can be represented by a single brick, the following paragraph regarding Sir James Mackintosh may be called a fair sample:

"Mackintosh is here on his way to Switzerland. I spent a very pleasant evening yesterday with him and Constant. He is, in truth, a most delightful creature. If I were a king, I should make an office for him in which it should be his duty to talk to me two or three hours a day, and then if my queen offended me, I would send Lady M. to talk for an equal time to her. He should fill my head with all sorts of knowledge, but, out of the great love I should bear towards my subjects, I would resolve never to take his advice about anything. He has got Rogers with him, who, as you know, has published a new poem entitled 'Jacqueline,' for which Murray has been goose enough to give him a guinea a line. But then 'Lara' precedes it, and I suppose he has been obliged to buy the lean rabbit along with the fat one, according to ancient usage."*

In short, the interest attaching to these letters is much greater than that belonging to the average volume of eighteenth-century correspondence, and, quite apart from their service in recalling the memory of an extraordinary man, they bring us much nearer to Dudley himself than do any of his other writings.

Russia. By Théophile Gautier, and by Other Distinguished French Travellers and Writers of Note. Translated from the French, with an additional chapter upon the struggle for supremacy in the Far East, by Florence MacIntyre Tyson. Illustrated by numerous photogravures. In two volumes. Philadelphia: The John C. Winston Press. 1905.

Théophile Gautier's work is too well known in the former editions which have presented it to the English-reading public during its already fairly long life, to require detailed notice. In general, it may be said that it stands the test of time wonderfully well; and while minor details of custom or costume have changed in recent years, it seems destined, on its sterling merits, to preserve a perennial freshness and charm. No one has ever described more poetically, with more exquisite imagery, the aspects of nature in Russia, and Gautier's sympathy is of immense value in keeping his mental compass true. Occasionally he seems inclined to generalize on insufficient grounds; occasionally, also, he imagines facts as to which any Russian could have set him right

*Rogers and Ward were not good friends. Ward condemned 'Columbus' in the *Quarterly*, and Rogers retaliated by launching the well-known epigram:

> "Ward has no heart, they say; but I deny it;
> He has a heart, and gets his speeches by it."

had he thought of mentioning them in time. For instance, in describing the church ceremony (which precedes the Blessing of the Neva on Epiphany Day), in the Winter Palace cathedral, he asserts that from the gallery he beheld "the Emperor and the Imperial Family in the sanctuary whenever the Holy Doors in the ikonostasis were opened." This is absolutely impossible, as under no circumstances are women, even of the reigning family, allowed in the sanctuary. The persons thus seen were, probably, assisting priests, and if the Imperial family were not standing in plain sight, twenty feet in front of the ikonostasis, they were absent, in the Imperial withdrawing-room on the right; or the Empress (it was in the reign of Alexander II.) was in the glass box below the gallery, which was specially constructed for her in her invalid years. Either Gautier or the translator confusingly substitutes "Eastern" for "Western" in the elaborate description of St. Isaac. He errs, also, when he states that the Eastern ritual requires all four sides of a church to be exactly alike; and in some other points. Probably the "Romanoff" monastery referred to, near Moscow, should read "Simeonoff," and is a translator's mistake.

In order to furnish a sort of compendium on Russia, various chapters have been added. "The Mir, the Rural Commune," by Anatole Leroy-Beaulieu, is too classic an authority as to conditions at the time it was written to require anything but bare mention. "The Russian Army and Navy" (author not named) represents matters previous to recent disasters, including the attribution of Grand Duke Alexis to the general command. "Religions and Sects," by Gustave Lejeal, is an attempt to sum up the entire question, and contains some extraordinary statements. Speaking of the Greek Church, he says: "She refuses to admit the creed of the Council of Nice," meaning that the Eastern Church does not admit to its creed the *filioque* clause, and being obviously ignorant that that is precisely the form in which the Council of Nicæa established it. A little later on he alludes to nine slight differences between the Greek and Russian Church customs, and omits to mention that, so far as Russia is concerned, many of these points refer only to the Church previous to Nikon's reforms, though he does mention Nikon. Where, we wonder, in "the orthodox catechism" (which confines itself to spiritual matters) is the Tsar called "the curator and protector of the Church"? Bishops are said to have large revenues, which allow them "to hold with dignity their places in the best society"; but this is a gratuitous assumption, on the model of the Roman Church, for Russian bishops are supposed to abjure society and devote themselves to their diocesan affairs. In his description of the peculiar sects either M. Lejeal or the translator is responsible for the infelicitous statement (or construction): "There are even a few, fortunately, who think a child should be baptized and fed with his mother's blood"; which is calculated to exaggerate even the legitimately painful doctrine. In the same manner, Sutaieff's doctrine is made to read: "The kingdom of God must come below"—intended for "from within," possibly, or "from below." Just above (vol. ii., p. 193) a typographical error makes "samaboys" out of "samabogs" (self-gods). The most remarkable doctrinal statement of all, however, is connected with Count L. N. Tolstoy: "A new sect has been grafted upon one of the last works of this great writer, 'The Kreutzer Sonata.' Its adherents, people of wealth and learning, would abandon a brilliant position to give themselves up to manual labor." As a matter of fact, the preaching by Tolstoy and adoption by his "adepts" of the manual-labor doctrine long preceded the work named—which is devoted, by the way, to the enforcement of a totally different doctrine!

The section on "Literature" is furnished from the long-familiar works by M. Louis Léger and Vicomte E. M. de Vogüé, and deals only with the older writers, but is, of course, admirable, so far as it goes. "Russian Art," by M. Marius Vachon, is highly appreciative, but hardly competent in the department of architecture, which it assumes to present very fully. (Had the translator, by the way, either rendered the title of the famous old Kieff church, the "Dime," as "The Tithes," or left it its accented *i*, the effect would have been better as well as more intelligible.) M. Vachon relies too much on the pronouncements of Viollet-le-Duc, who was badly informed as to Russian origins and styles in general. Possibly the translator is responsible for "the worship [instead of "reverence"] of images"; and for "Palace of the Corners," as a title for the "Faceted Palace," correctly rendered in Gautier's work. Gautier, by the way, got very much mixed up over that, the Golden Chamber, the Great Palace of the Kremlin, and the Treasury, as well as over the situation of Napoleon's statue there, evidently trusting too much to a belated memory.

M. Jules Legras's book on 'Siberia' is incorporated, with great good judgment. It appeared about eight years ago, and deserves to be known. The translator's own concluding article, on "Russian Policy in the Far East," is brief but excellent. As to her rendering from the French of the various selections, we regret to say that, while it is, on the whole, extremely good, she too frequently loses touch with the idiomatic turns of both languages; and precisely because of its high degree of attainment in most respects, these blemishes are the more noticeable. "The so simple disposition we are fancying," "forcible" (for "perforce"), and "principal" (for "principle") will serve as specimens of this regrettable carelessness.

The illustrations are very numerous, very beautifully reproduced, and well chosen; but it would have been well worth while to have had them labelled by a person acquainted with the country. Rarely does a splendidly prepared work suffer so much in this respect. In volume i., the plate labelled "Tomb of Peter the Great" represents the canopied resting-place of some prelate of the Roman Church (in a Gothic cathedral), surrounded by statues of prelates with the pointed Roman mitre, cardinals' hats, coats of arms, and so forth. Peter the Great lies in a plain, slab-covered tomb, in a horribly rococo church. "The Church Imperial, St. Petersburg" is in reality the church of the great palace at Peterhof, twenty miles from the capital. "Place Sonbrinski, Moscow" is intended for "Place Lubianski." In volume ii., "Entrance to Kremlin from Chinese Town, Moscow" should read: "To Chinese Town from the White Town." "The War Department, St. Petersburg." represents one end of the Admiralty and neighboring buildings. "Assumption Cathedral and Ivan's Tower, Moscow," should read: "The Synod Church." "Poshkoff Museum, Moscow" arises from a confusion of names. It represents the Rumyantzoff Museum, formerly the residence of Mr. Pashkoff. The "Palace of Peter the Great, Moscow," offers a view of the wall, holy gate, and churches in the Novodievitche Convent, several miles from the Petrovsky Palace, which is intended; and the "Cathedral Interior," with its Gothic vaulting, pews, and unscreened altar, is unmistakably Roman Catholic, not Russian. The volumes are beautifully printed and bound.

George Bernard Shaw and his Plays. By Henry L. Mencken. Boston: John W. Luce & Co. 1905.

A great deal too much has been written about Mr. Shaw and his opinions, especially by himself. When the London theatres were making experiments with Ibsen's plays in the eighties, the vast majority of those who saw or read them were far from sure what the author was driving at. But Ibsen was a reserved person, who either did not know or neglected the uses of self-advertisement. Mr. Shaw, no doubt, realized from such an example that if you let discussion languish, the intelligent will simply absorb and give out your theories again in a more popular form without any thanks to you, while the general public will regard your name as a synonym of the suspiciously obscure. The author of the 'Quintessence of Ibsenism' did his best to prove that Ibsen had a persistent purpose (which, however, remains doubtful, since Ibsen himself seems inclined to smile at the assertion that he has always used his plays to expound his social philosophy). But Ibsen, at any rate, kept carefully in the background. He challenged outworn ideals, and showed us situations in which happiness depended on giving them up and following the lead of one's own individuality. For Mr. Shaw, an ideal *qua* ideal is a *bête noire*, except, indeed, the old classical ideal of the Perfect Man, who is no more likely nowadays to become real than when the Stoics dreamed of him. Ibsen has left his mark and made his disciples because he was in earnest, and because he did not stultify his own teaching by a wholesale condemnation of every convention and ideal that has been evolved by the human race. This Mr. Shaw does, and the iconoclastic spirit of youth would probably secure him disciples enough if he did not indulge the freakish irony which drives him to turn and laugh in the face of his admirers directly they try to formulate a Shavian doctrine. It is this excess of irony that shocks the French taste, and has made M. Filon, the critic and historian of the drama, refuse to see in Mr. Shaw's plays any real attempt to reform society; only that mania for tearing down fences and setting fire to commons which he has ascribed to one of his own characters. The fences are repaired, and

the common grows up again all the greener, and there is an end.

Mr. Mencken, in this brief volume of about one hundred pages, attempts to do for Mr. Shaw what was done for Ibsen in the 'Quintessence of Ibsenism,' years ago. But it is not so easy to write a Quintessence of Shavianism unless one is ready, as Mr. Shaw was in his tract, to go all the way with one's subject, or even further, and to wring the quintessence out of him. This Mr. Mencken cannot do. What made the 'Quintessence' valuable was the peculiar equipment of Mr. Shaw for the task, just as George Meredith's 'Idea of Comedy' has become a classic because he himself was a master of the comic spirit. But the writer of the present volume does little more than give us a résumé of the plays and novels. The book is, in fact, intended for those who, after seeing a performance of "Man and Superman," are disinclined for the exertion of reading those plays that are not now being presented on the stage. The truth is, that the time has not yet arrived for a book on Mr. Shaw. Newspaper paragraphs answer the purpose where anything has been left unsaid by Mr. Shaw himself in his prefaces, or by the characters who are the mouthpiece of his opinions. Who can tell whether Mr. Shaw will ever settle down to the task of one who takes his reforms seriously, as a reformer must do unless he intends to create mere bewilderment? As little could the average Athenian appreciate what Socrates was driving at, or whether he would have any permanent place in the history of thought, as we can properly place Mr. Shaw. And Socrates was at least terribly in earnest, and was never tested by becoming the *enfant gâté* of the public. Moreover, Socrates had not been forced to suppress himself for years as a struggling journalist before he could let himself go as a social iconoclast.

It is not easy to interpret the plays of a playwright with a purpose. This fact the ingenious Mr. Verrall is once more demonstrating in his interpretations of the plays of Euripides. Mr. Mencken, however, rather describes than interprets, and his book will no doubt find grateful readers among Mr. Shaw's American audiences. What he means when he tells the playgoer that "Man and Superman" is "in purpose one with the 'Odyssey,'" we cannot imagine, for we had always thought that there was a purpose in the play, and there is none in the 'Odyssey,' save to delight the weary. Mr. Mencken says of "The Devil's Disciple" that, among the religious, only "a man given to constant self-analysis—the 999th man in the thousand" could appreciate it. This is probably an echo of Mr. Shaw's one realist in a thousand in the 'Quintessence.' But he was, of course, the thousandth man, not the 999th.

Mr. Mencken's English is rather too colloquial for elegance. "When Darwin bobbed up," "A young woman of money," "oldster" (a horrid analogous formation), are a few of his faults of style. Nor can we admire the tone of the biographical note. It is not in good taste to drag in a man's relatives as evidence of his private circumstances—at any rate, not until he is dead and has been handed over to his biographers for dissection. Of the Shaw family Mr. Mencken writes: "Its present head is Major Sir Frederick Shaw, Bart., D.S.O. of Bushey Park, Dublin. A respectable, well-sounding name and address." What has this to do with Mr. Shaw or his plays? Mr. Shaw has shown a rather indecent lack of reticence about his mother, but we might leave his cousins and uncles alone until he has put them, also, into a preface. In the introduction, Mr. Barrie's play is referred to as "*Agnes*-sit-by-the-fire"; Beerbohm is spelt Beer*h*ohm; Sudermann's play is more than once referred to as "Johnnisfeuer." The Berkeley Lyceum is not in Forty-fifth Street (p. 97).

A History of Egypt from the XIXth to the XXXth Dynasties. By W. M. Flinders Petrie, D.C.L., etc. With numerous illustrations. Charles Scribner's Sons. 12mo, pp. xx., 406.

Primitive Art in Egypt. By Jean Capart. Translated from the revised and augmented original edition by A. S. Griffith. With 208 illustrations. Philadelphia: J. B. Lippincott Co. 8vo, pp. xx., 304.

The Religion of the Ancient Egyptians. By Georg Steindorff, Ph.D. G. P. Putnam's Sons. 12mo, pp. ix., 178.

Three notable works on Egypt are these which have just come from the press. They are the works of specialists, and form valuable additions to the literature of the subject. Professor Petrie is recognized as the most expert and experienced excavator who has ever operated upon the archæological field of Egypt. For many years he has labored in Egypt or Palestine laying bare multitudes of sites and preserving such a record of things just as he found them, that the later investigator is practically as well off as though the excavations had been his own. His professional training as an engineer has stood him in good stead, and his memoirs, issued by the Egypt Exploration Fund, are models of conciseness and of thoroughness. His 'History' has now reached its conclusion, at least it has reached the limit of the dynasties of Manetho. But to say that the history is "completed" is a different thing. No history of Egypt will be finished till the last monument is found and all the mountain tombs have given up their story. There seems to be no sign of exhaustion, and the discoveries by a countryman of our own during the winter of 1904-5, have well nigh eclipsed all that have preceded. But Professor Petrie has completed the task of portraying all of Manetho's thirty dynasties, and he has done it well from a scholarly point of view. He has made a book for students and for specialists, a book which enables us to say that the best and most inclusive history of Egypt is in English; but it is not one that can be read with ease or possesses literary merit. Dynasty follows dynasty, and reign follows reign, and the same method of treatment is used in each case, modified only by the fulness or paucity of material. The various forms of the name of the king are given in English transliteration, and in hieroglyphic character, with the dates of his life. Then follow lists of the monuments which contain his name, tell of his deeds, or testify to his building activity; lists of his wives and children; and in some cases texts are cited showing from whom a given king received divine honor and worship. Then a narrative account of all known facts follows, and illustrations are introduced and make the story plain and more vivid. Frequently there are half-tone representations of the cartouches of kings taken from scarabs and other objects.

The present volume and those which preceded are mines of historical information up to date for the time of composition. Subsequent discoveries have made revision necessary, and the first volume especially should be again subjected to this process. The detail of the volume before us is so immense as to make a correspondingly detailed judgment impossible. One almost stands aghast at the magnitude of the task, and the book is a constant source of wonder that we are able, with such minuteness and such accuracy of statement and chronology, to follow the movement of events in times which long preceded the beginning of our era. We are here taken back more than thirteen hundred years before Christ, and yet the materials dovetail together so closely that the author declares there is no unfilled gap longer than ten years. A similar claim is scarcely made for any other history so ancient. The entire series is now completed except the volume on 'Arabic Egypt,' originally assigned to Mr. Stanley Lane-Poole.

'Primitive Art in Egypt' is by the Keeper of the Egyptian antiquities in the Royal Museum at Brussels. It is from first to last a tribute to the labors of Professor Petrie in excavation and exploration. Professor Capart gives credit where it is due, and cites throughout the various "Memoirs" of Petrie, and the works which he published independently as well as on behalf of the "Archæological Survey", and the "Research Account" of the Egypt Exploration Fund. The volume is sumptuously got up. The type is large, and the illustrations numerous and excellent. On these, of course, the value of the book depends in large measure, and in nearly all important cases the pictures are made by the half-tone process. The body of the text is a plain descriptive narrative based on the objects themselves. At times it approaches a catalogue in its baldness, and generally it is an attempt to describe the objects and such incidental resemblances as have been discovered to objects of other provenience. The order of treatment is dictated by the author's idea of the natural progression of an uncultured people toward artistic expression; first, objects of personal adornment; second, ornamental and decorative art; third, sculpture and painting; and fourth, historical and dynastic monuments. The particular points of interest in this phase of Egyptian art are two—that it is prehistoric, in the sense of predynastic, and that it forms the newly discovered background which explains the otherwise sudden emergence of Egyptian hieroglyphic writing on stone of a high degree of technical excellence at an early point in the "Ancient Kingdom." And the discoveries which have given us these almost startling revelations of primitive conditions along the Nile are mainly the work of one man and his pupils, and have been made within a decade and a half. Professor Capart agrees in the main with Professor Petrie's theories, but he does not obtrude any dogmatic views upon the reader. He looks to

a distant future for a solution of the problems which he attempts to state, and toward the solution of which he has gathered some materials.

Dr. Steindorff, who writes upon the 'Religion of the Ancient Egyptians,' is professor of Egyptology at the University of Leipzig, where he succeeded the late Prof. George Ebers. His work contains a series of five lectures, which were delivered about a year ago in various places in the United States, under the auspices of the "Committee on Lectures on the History of Religions." It is not large, nor is it burdened with notes and references, though these are not entirely wanting. The treatment is assuredly popular. Footnotes would have given a more scholarly appearance, to be sure, but they would not have rendered the lectures themselves more scholarly. In fact, the lectures are learned, notes or no notes, and they are the product of year-long study and investigation by one of the ablest and most brilliant of the younger school of Egyptologists in Germany. There have been many books on the religion of the Egyptians. Some of them have been swamped by details, some have been covered up and obscured by speculations and conjectures, and some have been loaded with things that simply were not true. In the present volume these faults have been avoided, and we have the most reliable, readable, and sane treatment of the religion of Egypt which has appeared. Of course, thousands of things are omitted, but, for a survey of the field and an account of the essential facts, Professor Steindorff's treatise is preëminently satisfactory. He takes us back to the earliest times, and thence traces the development through Egyptian history and out into the non-Egyptian world. Midway he stops to discuss the temples and the ceremonies, magical arts, the life after death, and the graves and methods of burial. The gods are discussed incidentally, and the system of belief is portrayed with as much coherence and consistency as it actually possessed.

In Further Ardenne. By the Rev. T. H. Passmore, M.A. London: J. M. Dent & Co.; New York: E. P. Dutton & Co. 1905.

Popular books on the Grand Duchy of Luxembourg are so few that Mr. Passmore has revelled in a little-exploited field, the best part of which he has tramped over with a sympathetic eye for nature and a far from common tolerance of things or people un-English. His results appear in a fine volume illustrated with full-page photographs equally characteristic and excellent, though the addition of a few of Turner's marvellous sketches would have corresponded more completely with the spirit of the region which the author seeks to render. An ample historical sketch traces the fortunes of the Duchy through its vicissitudes as a battle-ground of Central Europe to its present state as neutral, inviolable territory; the remaining, and larger, part of the work dealing with description and comment concerning people, life, and customs as studied by the author.

In the historical portion, breadth of treatment brings out the successive occupations with a somewhat exuberant wealth of words. For instance, "Feudal Society" (ch. iii.) seems to devote too much space to details of mediæval life common to Central Europe in general. The eagerness to over-dramatize historical movements carries the author away into rhetorical outbursts at least as open to attack as those of the "progressive liberals" so freely indulged in (p. 62). On page 29 we read: "Many know-alls at this day know all about the selfishness and self-indulgence of monks, their 'cowardly flight from temptation,' and the rest. Mr. Ruskin's pedant crudities in 'Ethics of the Dust' may be taken as apostolically exponent of this lofty school." Verily, the oratory of the pulpit is a dangerous habit to give way to in a secular publication. We may add that the victory of Sadowa was not the culmination of a "Seven *Days'* War" (p. 108); Moltke required a trifle more time for his great strategies.

When we turn to the real body of this work, the writer, without change of tone, conveys, notwithstanding, a vivid impression of a charming little country hitherto saved from the personally-conducted mob, where the pedestrian can still roam without incessant fret from horn, dust, or whiff of motor-car. Any wayfarer who knows Esch-le-Trou, Clervaux, Meysembourg, or Vianden can renew through Mr. Passmore's pages some of the experiences of restful enjoyment which the throng of travel renders so rare to-day. Similar appreciation of the Luxembourgeois character emphasizes the simple qualities of application, thrift, and devotion to country and customs which seem to secure to the peaceful folk not merely security from foreign aggression or encroachment, but the same kind of prosperity which the casual tourist observes in Switzerland.

And yet, would that Mr. Passmore had put all his experience in simpler phrase. His command of verbal wealth and imagery too often leads him from standards safe astray. How much, for instance, is there of verifiable generalization, how much of mere showy antithesis, in the following (p. 62): "They [the dark ages] contributed marauders, brigands, oppressors, rebels; we provide anarchists, female post-office officials, dynamitards, Hooligans, the man-woman, regicides, sots, and—a commodity unknown to those older ages—vulgarity"? Again, from machicolated walls the besieged hurled "a rain of scented, warmed, or poly-angular objects—those 'at home' cards, so to speak, which formed so cheering a feature of young European society" (p. 64). We may have no reverence for Louis XIV., but our feeling finds imperfect reflection in the description, "painting the closing decades of the seventeenth century red" (p. 96).

A Self-Supporting Home. By Kate V. Saint-Maur. The Macmillan Co. 1905.

In this day of crowded cities where rents and aliments are more or less of excessive price, and conveniences are out of proportion to discomforts, a practical method of escaping urban life without risking greater difficulties should be hailed with enthusiasm. The plan of a self-supporting home in the country, as depicted by Mrs. Saint-Maur, is intended to assist in this accomplishment with entire ease. It is essentially within the reach of women. It suggests a way by which the sex may emancipate itself from the restrictions of a city home, without revolutionizing domestic traditions, and with economy.

The first twelve chapters of the book deal chronologically with the problems likely to arise in each month of the year. Mrs. Saint-Maur describes the methods to be employed. These have been carefully embalmed, for reference, in a note-book, whose contents, the outcome of nine years' experience, have supplied her with material for her volume, which is really valuable by reason of definite, practical information covering a wide range of topics. The raising of fowl and pheasants, breeding pet cats and rabbits, care of bees, cows, orchards, gardens—these are some of the suggested activities which are given adequate treatment, and are discussed in a businesslike manner. The supremely optimistic tone of the book will arouse apprehensions in some minds. Even a cheerful person will doubt the possibility of life being made so unfailingly joyous and prosperous. In the author's calculations as to the multiplication of animals and dollars, little allowance is made for failures or accidents. No one without the aid of a corps of assistants would presume, in the day of twenty-four hours, to try more than a small number of the many industries prescribed as "necessary additions" to welfare in country living. Yet it is clearly shown, in spite of the enthusiastic gloss, that if enough are undertaken to make the venture pay at all, they must be conducted so conscientiously as to consume a woman's entire time. This is a drawback. Most women would object to the seclusion in the country, away from friends, facilities for social intercourse, and change to a life of quite as strenuous activity along rural lines as that which a town existence demands. The book is less a profitable guide to the "simple life" than a logical statement of old facts, with suggestions of many new ones, regarding those agricultural pursuits which may be followed in a less ambitious way by any woman who has at her command a plot of ground, either in the suburbs of a city or in the more open country.

The style of the author is simple and unaffected. What she says will sound easy of accomplishment to the veriest novice. There is a convenient index, which enables the reader to find readily the special subject in which he may be interested. The illustrations, in some cases suggestive, in others are quite superfluous.

ON THE FIELD OF GLORY

By HENRYK SIENKIEWICZ

Translated from the Polish by Jeremiah Curtin. 12mo, Cloth, $1.50

This important work is the only one written by this renowned author since the year 1900, when he completed "Knights of the Cross." The scenes are laid in Poland and the period is the reign of the famous King John Sobieski, just before the Turkish invasion of 1682 to 1683. Sienkiewicz has woven a wonderful romance of great brilliancy, and in no book has he displayed his great genius more strikingly.

"Romantic, dramatic, poetic and intensely human by turn, it is a masterly work by a masterly writer."—*New York Globe.*

"A brilliant romance, full of strong character drawing and full of love."—JEANNETTE L. GILDER, Editor of the *Critic.*

Published by LITTLE, BROWN & CO., BOSTON

The Nation.

NEW YORK, THURSDAY, FEBRUARY 8, 1906.

The Week.

While Congress is wasting time over railway legislation, the day approaches for the going into effect of the new German tariff. In that measure lies a threat of greater injury to American industry than could be caused by a thousand unjust railroad rates. Yet the Administration is sitting down before it helpless. It is not that Germany's coming tariff discriminates against us, but that the absolute control of our Government by the protected interests, combined with President Roosevelt's having paid tariff revision as the price of his phantom railway law, renders it impossible for this country to take advantage of German offers. Germany abounds in good will for us. Her Ambassador at Washington has pressed upon Secretary Root one form of reciprocity treaty after another; but the Senate, where the brute force of our tariff beneficiaries is entrenched, is like a stone wall. Nothing has been done. It is thought nothing can be done. Lodge still has his bogus-jewelry manufactures on his back; the New York Senators are yet ridden by their glove-makers; Penrose and Foraker and Beveridge have each his tariff old man of the sea upon his shoulders; Aldrich remains true to the interests he has sworn to protect, and the Government of the United States is left in the humiliating position of not being able to take a step diplomatically to ward off from its citizens an impending loss of trade.

"His term of service will expire March 3, 1907." Such is the last sentence of the Congressional Directory's sketch of Senator Patterson of Colorado, who last week announced his conversion to the President's Dominican policy. Singularly, the other so-called "White House Democrats" who are counted upon to get the San Domingo treaty through the Senate, are also Senators whose terms of service expire March 3, 1907. Senators have a way of wishing to be reelected. Even Morgan at eighty-one and Pettus at eighty-four say they will seek another term. The term may expire, but Senatorial ambition never does; and the fact of being in good standing at the White House, with a little incidental patronage, is supposed to be a great help in convincing a Legislature that the candidate for reëlection is the man above all others to represent the State in the Senate. Now we are as far as possible from asserting that Senator Patterson's sudden transformation from a violent opponent of President Roosevelt into an ardent supporter has any connection with his own political ambitions. We are for freedom of opinion and disregard of party trammels, and it may be that Mr. Patterson is also, and that he is actuated by the highest motives in breaking with his Democratic colleagues. But he must know that all the Washington gossip is to the contrary; that the common story of the lobbies is that the President is working to win over four or five Democratic Senators by the use of patronage. Consequently, we think Senator Patterson should place his conduct beyond suspicion by showing that not one postmaster or gauger has entered into the forming of his conscientious convictions. To make his disinterestedness as clear as noonday, he might imitate the President in declaring that he will not be a candidate for reëlection.

That the President is using the offices "in order to do busIness with the Senate," as he expresses it, is unhappily beyond doubt. He is doing it as freely as any more fortunate predecessor —more fortunate in not having been hampered by loud protestations of enmity to the spoils system. One has only to read the columns in the Washington *Star* devoted to the day's events at the White House, to see what is going on. Most of the talk is about scrambling for appointments. "Senator Allee lands his man." "Senator Gamble has had to give up to Senator Kittredge in the fight over the postmastership." "The President has promised Senator Clarke that no internal-revenue collector shall be named without consulting him." And so on. When Representative Overstreet protested against Mr. Roosevelt's giving Senator Beveridge an extra bit of patronage at Indianapolis, he was frankly told that, in the present posture of affairs, it is much more important to placate a Senator than a mere member of the House. Of course, the President is acting from the loftiest motives —that is always understood; but the miserable result is that the public service is being steadily debauched, the spoils employed openly to win votes in Congress, and the broken chains of the bosses welded.

Ingenious friends of the President will need to employ all their most subtle theories to account for his vacillations and final surrender in the matter of rate-fixing legislation. It is now plain that the Senate is to have its way. The Interstate Commerce Commission will not be given power to make railroad rates independently; review and control by the courts will be retained as at present. That is the point for which the best lawyers and clearest-headed men in the Senate have all along contended, and that is the point which the President is now ready to concede. All his loud protests to the contrary were simply playful, it now appears, or fresh illustrations of his "open mind." The clear practical upshot, however, is his tacit abandonment of the campaign he has been waging since his message of 1904. There will be a railway bill. It will contain excellent and needed provisions against rebates and the abuses of private-car lines, etc.; but what Congressman McCall aptly termed "the Presidential non-sequitur" will not be in it. The Commission, that is, will not be empowered to make a rate, to go into effect "at once" without a prior appeal to the courts to determine whether the rate be reasonable and just. In all that matter, we shall stay much as we are. Of course, Mr. Roosevelt will claim a great victory for his ideas, just as he did in the case of the Elkins bill of 1903, which he then declared to be all the railway legislation required; but the facts are not in doubt. The President has retreated. Though assured that he could have the bill he wanted by a combination of Republican and Democratic votes, he shrank before Senator Crane's bogey of a split in his own party which would outlast his term of office. He assents to a rate-making clause which amounts to nothing, and for it has paid the price of giving up tariff revision. A birthright has thus again been sold for a mess of pottage.

But yesterday we had a pretty penpicture from Washington of the two Wisconsin Senators visiting the White House arm in arm, sharing each other's sorrows, sharing each other's joys. So Saturday's news was an extremely unpleasant surprise. The Consul-General at Hongkong, Gen. Bragg, a Wisconsin man, plans to retire; so Senator Spooner recommended a man for the place and saw the nomination transmitted to the Senate, only to have his new colleague invoke Senatorial courtesy and hold up the nomination. Now, Spooner has returned the compliment by holding up a La Follette nomination, and the two are in a fair way to just such a cat-and-dog existence as was predicted for them when the Governor first decided to go to the Senate. The man over whom the dispute has begun is Dr. Amos Parker Wilder, the accomplished editor of the *Wisconsin State Journal*, who was originally a La Follette man and went over to the Stalwart side only after the Governor's refusal to accept the compromise reform bills passed by the Legislature of three years ago. To change sides, even

from the most conscientious motives, and then receive office at the hands of one's new friends, is not a course calculated to increase or retain the esteem of the old. La Follette's supporters would doubtless regard as pusillanimous a concession on such a point.

Apparently, we are to have another great coal strike. The break between operators and miners in the soft-coal fields seems complete; and it may be followed by as absolute a failure to agree in the anthracite regions also. With the demand of the miners for higher wages, it is possible to sympathize. Positively high wages have become relatively low in consequence of the way in which the tariff and Trusts, hiding behind the tariff, have screwed up the cost of the necessaries of life. This increase within five years is admitted by the Bureau of Labor to be about 35 per cent. But it is unfortunately the case that the United Mine Workers propose to add themselves as one more protective monopoly to the many which make hard the lot of the poor. They are demanding higher wages, not for all men who may wish to labor in the mines, but strictly for their own organization, with no wages at all and ostracism and peril for the miner who does not submit in all things to John Mitchell. This is the intolerable part of the Mine Workers' programme, just as it is of the Typographical Union which is now fighting the open shop in this and so many other cities. The rapid rise of employers' associations, like that of Chicago, is the inevitable response to such attacks upon the freedom of labor. In 1903 there were 1,300 strikes in Chicago; owing to the vigorous stand of the employers, and their sharp prosecutions of law-breakers, the number was cut down to 800 in 1904, and the open shop was established in many industries. Unionism which goes to extremes is, in fact, doing more for the open shop than could any amount of abstract arguing.

Thursday's report of the Chamber of Commerce committee on currency reform may be described as highly conservative. It disapproves Secretary Shaw's plan for a 50 per cent. increase in banknote issues, specially taxed so as to prevent their circulation except when needed. The committee's view is that our present circulating medium is probably larger than the country's needs, and that "the excess, if any, only tends to inflation of values." The committee objects particularly to the Secretary's plan of eliminating from such emergency note issues the words "secured by United States bonds deposited." To do this, the committee argues, is objectionable because it would "constitute another form of currency" when we have too many forms already. Pointing out, further, that very nearly half of the existing national banks are only five years old, and have an average capital of only $59,000, the report very plainly declares that such extended powers of note issue "would, under existing currency laws, prove a most hazardous experiment."

In positive recommendation, the committee goes no further than to urge again repeal of the law restricting redemption of banknotes to $3,000,000 monthly, and to renew the Chamber's proposal of 1902, that Treasury surplus moneys, outside of the gold reserve and a proper working balance, should be deposited in bank against other security than that of United States bonds. Again following the report of 1902, the committee advises that not less than 2 per cent. interest be required on such deposits. It is needless to say that we agree with the committee's recommendations. In the matter of the banknote currency, indeed, we think they go by no means far enough. But whether the actual expedients proposed would meet the situation which Mr. Schiff a month ago described as "a disgrace to a civilized country," we confess to entertaining doubts. The committee thinks that, with a charge of 2 per cent. or more on public deposits in the banks, "there probably would result a return in part of such moneys to the Treasury" when, with a prevalent low rate of interest, "such moneys could no longer be used by the banks to advantage." Undoubtedly, such a result would follow in the case of banks which cater to legitimate trade and not to Wall Street speculation. What the policy of banks with a speculative clientèle would be, we can only judge from their policy towards interior bank deposits. Throughout all the 1 and 2 per cent. call-money market of 1904, these banks paid 2 per cent. for the use of such out-of-town balances. We are unable to see why their policy towards Treasury deposits would be different.

For a broad view of the proposed investigation of the State Department of Banking, we commend our readers to the statesmen now indulging in large discourse in Albany. The question at issue, it appears, is not whether Superintendent F. D. Kilburn is managing his office efficiently and honestly, not whether the discovery and correction of possible abuses may safeguard the property of both stockholders and depositors in State banks, not whether the Department is, like the Insurance Department under Francis Hendricks, honeycombed with political corruption. These, it seems, are minor matters, beneath the attention of our exalted legislators. The thing which Senators and Assemblymen want to know is whether an investigation will damage the Republican party. Many of our astute lawmakers seem to fear that, if the lid is once lifted, the revelations of the activity of Republican leaders will be as shocking as those which Mr. Hughes laid bare. Hence the loud cries that Kilburn should resign and thus quiet the clamor for more light. "He should," says one, "have the good sense to retire"; for an investigation of his conduct "may lead to party disaster and financial disaster." Another far-sighted gentleman remarks: "No man who has been honored by his party for so long as Mr. Kilburn has been, should bring about such a dreadful situation." In behalf of some millions of people who are not politicians, but are mere citizens and taxpayers, we beg to observe that Kilburn and Hendricks are nothing but public servants; and the public has a right to demand from them an accounting for their stewardship. If in the course of this accounting some tricky friends of the State administration come to grief, and some thieving bank officers are caught, upright men will have every reason to rejoice.

Justice Joseph M. Deuel declares he will not resign from the Court of Special Sessions. That is, he prefers to be removed under charges. Certainly, he can be under no illusion as to public opinion regarding his connection with *Town Topics*. No one can be found to dissent from the implication of the verdict of the jury, that his conduct has been disgraceful. We presume, then, that the facts brought out in his suit against Norman Hapgood for libel will be presented for action by the Appellate Division. Whatever the decision of that body may be in regard to his violation of the charter by engaging in business, a further point remains for the consideration of District Attorney Jerome: whether Col. William d'Alton Mann and Justice Deuel have not been guilty either of blackmail or extortion. As to their moral delinquency there is no doubt; but moral guilt is not always legal guilt. Yet if Thomas P. Wickes, on the strength of the Jarvis letters, was convicted of blackmail, the evidence against Mann and Deuel would seem to the lay mind overwhelming. Probably there is also other testimony which was not offered in the trial of Mr. Hapgood. Naturally, the District Attorney ought not to proceed against a man unless he is convinced that the case is well grounded. But no verdict is sure until the jury has reported; and a prosecuting officer would accomplish nothing if he waited till every one who was accused pleaded guilty.

What ails the Ohio Legislature when it passes a resolution to investigate Boss

Cox of Cincinnati? It must know in advance, and on the highest authority, that there is nothing but purity and nobility to investigate. In a speech in the House of Representatives on January 18, 1904, Congressman Nicholas Longworth said:

"Then Mr. George Cox is alluded to, a man who, unaided and simply through force of ability and character, built himself up from a poor working boy to be one of Cincinnati's most eminent citizens, a man of whom there is nobody who does not say that his word is as good as his bond. If it is a curse to have citizens like this; if it is a curse to have clean, able, and upright men to administer the affairs of the city, then Cincinnati is indeed cursed."

It is true that Secretary Taft has denounced Cox as a first-class political rogue, but then, Mr. Taft was never sent to Congress by Cox. And is it not something liko *lèse-majesté* to refuse to take Congressman Longworth's word for it, and submit the "eminent citizen" of Cincinnati to rude questions about his stealings?

The Cooper Union meeting of protest against suffrage conditions in the South has not received the attention it deserves. It was not a gathering of colored people only; nor was it an isolated and sporadic expression of dissent. The colored people will not sit still and submit to injustice. As they rise in the social scale, their demands for equality as American citizens will surely become more and more insistent. Moreover, as the organization of the Constitutional League which arranged the Cooper Union meeting shows, there are plenty of white people who will stand by them in their battle for their right to participate in the Government. Just at present, the reactionaries of the South and North are having things their own way, as witness the bill introduced in the Virginia Legislature to compel every street-car line in that State to provide "Jim Crow" cars, and the steadfast refusal of the Northern labor unions to permit the negro to learn a trade anywhere, as Mr. Washington has pointed out, but in a penitentiary. But with every year the rise of the negro in material prosperity, and his steady contribution to the wealth and prosperity of the country, will make it more and more preposterous to deny him some of the rights of citizenship because of his color.

In a recent address before the Boston Commercial Club, Prof. Albert Bushnell Hart of Harvard College, who has been making a very careful study of the South, urged that section to drop its insistence upon the negro problem as the dominant issue, and pay some attention to other matters. He pointed out that with one-third of the population of the country, the South furnishes only two-sixteenths of the manufactures, and that this proportion has not increased in the last ten years. The labor problem, the South insists, is at the bottom of the trouble. Yet it makes no systematic effort to uplift the large masses of poor whites and colored people within its boundaries so as to fit them for productive labor. The "poor whites," every whit as shiftless and lazy as the negroes, are ignored, and effort is constantly made to withdraw from the negroes those rewards in the way of citizenship and public esteem and prominence which have been, the world over, an incentive to the laboring classes to struggle upwards. Professor Hart did not, so far as reported, cite Mississippi as a special illustration of his argument. Only 1,500 negroes voted in that State out of a population of 900,000, in the Presidential election of 1904, while not a Republican vote was cast in the Congressional campaign of 1902. Yet the Vardaman gubernatorial campaign of 1903 dealt solely with the race question. With the negro out of politics; with a mixture of the races forbidden; with schooling of the negroes at so low an ebb as to satisfy the worst negro-hater, an efficient State police should solve every other race question, and leave the whites free to advance their State and talk of something else. But no; so long as a politician has his way, the race issue will be kept alive to the exclusion of every other.

Whether Mr. Balfour is to continue to lead the Unionist party is a subject of eager discussion in England. His opportunism has led the party to its most disastrous defeat in two generations, and there is a general desire for a militant chief. That chief Mr. Chamberlain, who still abounds in expressions of loyalty to Mr. Balfour, could probably name if he were not too modest. Yet the matter is not simple. Mr. Balfour, in most trying circumstances, showed remarkable tenacity concerning the Premiership; he may not readily consent to let go the party leadership. Moreover, to make room for Chamberlain would by no means solve the difficulties that beset the Unionists. Mr. Chamberlain is old and in but indifferent health; no party can hope to follow his personal leadership for long. To accept him as a temporary leader would have no sense, except on the theory that his political policies would outlive him and evoke new champions. To this hope the recent election gives no countenance. Whatever may or may not have been the cause of the Unionist catastrophe, it is certain that Imperial tariffs singularly failed in the intention of reinvigorating a party gone stale. And if the country has given no comfort to Mr. Chamberlain's ideas, the protectionists have not produced a propagandist of anything like his force or of any promise as his successor. Accordingly, to change leaders in favor of Chamberlain would provide only for the immediate lean years of Opposition, and it should not be rashly concluded that the Unionists will incontinently turn to Mr. Chamberlain because Mr. Balfour is the most damaged Unionist of all.

Theoretically desirable the separation of Church and State has always been in France. The inequity of the actual law lies in the fact that the Church is, on the whole, more regulated than before. The whole form of parish organization has been changed. Churches become public property, and are leased only at discretion to the newly formed *associations cultuelles*. It is the steps preliminary to this virtual confiscation which have provoked the present disturbances. Furthermore, the endowments to be held by parishes are greatly restricted, and the State constitutes itself judge not only of the loyalty of an association, but of its orthodoxy. Through the abolition of the Concordat, the State sacrifices the right of nominating bishops. It is said that it will endeavor to maintain this prerogative in the absence of a treaty with the Vatican. In fine, the Church is treated as a suspect, whose conduct must be inquired into and regulated with a minuteness hitherto reserved for the unfortunates of the streets. One may deplore the fact that the Catholics of France do not obey the Biblical injunction to turn the other cheek; one can hardly wonder that their bewilderment and indignation occasionally find vent in violence.

Though the League of Leagues has formally condemned the plan for an Imperial Duma, its members are registering for the approaching elections. This, one may fairly hope, means that the revolutionary programme of this powerful order is temporarily in abeyance, and that, while disapproving the election of a merely advisory council, the Leaguers will actually wait to see what recommendations the Duma makes and how far these are adopted by the Czar. For the moment, he has the upper hand. It is of the highest importance not only that the Duma should meet, but that it should be representative, and should arrive at a definite scheme of reform. The danger is that it may fall into the hands of the reactionaries and leave the war of classes just where it is today. Even the revolutionaries need not doubt the power of irresponsible assemblies which are in earnest. The first Zemstvo Congress will not readily be forgotten, though it merely passed a set of resolutions. On all grounds it is to be hoped that the Imperial plan may have a fair trial. From a return to anarchy nothing could be gained, while a responsible parliament made out of whole cloth is hardly conceivable. All sober-minded Russians, then, should hesitate to discredit the Duma.

PARTISANSHIP AND TREATIES.

The pain of Republicans at the sight of the Democratic Senators deciding to make a party question of a treaty is a trifle too ostentatious. Their grief is nominally because of a vicious principle—the injection of the partisan spirit into a question of foreign relations. Treaties ought to be beyond that; they touch the great interest of a continuous policy in foreign affairs, irrespective of party; there is the solemn oath of Senators, etc. But the real woe of the shocked Republicans is that the caucus action of Democratic Senators may defeat their own plans; and at all events their pretence of being shocked is hollow, for they have repeatedly done themselves what they now reproach the Democrats with doing. To their indignant question, When did you ever see us make a party question of a treaty? the true answer is, We never saw you do anything else.

We agree, for our part, that party constraint ought not to be resorted to in order to force Senators to vote against their personal convictions. Nor would we limit this to treaties. The Administration is willing, even desirous, that its San Domingo treaty should be ratified by the aid of Democratic votes; but it starts back in horror at the thought of revising the tariff by the aid of Democratic votes. On general principles, and with an eye solely to the public good, it might well be argued that every Congressman ought to follow his inner persuasion, and not the party whip; but this doctrine falls with a strange sound from Republican lips, even when it is limited to the matter of treaties. If there is to be a great reform, let Messieurs the Republican assassins of treaties commence.

In 1888, they defeated the Bayard-Chamberlain treaty by, as the *Tribune* gloried at the time, "a strict party vote." Every Democratic Senator voted for that treaty; every Republican Senator against it. And there was no concealment about the reasons. It was an Administration treaty in a Presidential year; Mr. Cleveland had been renominated, and the common understanding was, as the *Tribune* reported the English view of it, that "the Republican Opposition could not allow the Administration to get the credit of a great stroke of statesmanship on the eve of the American elections." In the list of Republican Senators of that day who struck hands gleefully to kill a treaty solely because it was negotiated by a Democratic President, are the names of several gentlemen who are to-day so deeply dejected at the baleful exhibition of partisanship by the Democrats.

It is well known, also, that Republican treaties have been forced through the Senate by the severest party pressure. Senator Hoar testified that only by such means was the ratification of the treaty with Spain finally secured. The Panama treaty of Mr. Roosevelt was in like manner made a party measure. Senator Hanna counted noses and reached for votes in its behalf with all the assiduity and skill and unscrupulousness which characterized his management as party chairman. We have heard of a Republican Senator who, when reproached for voting for that treaty, which was intended to legitimize a theft, frankly explained that he was acting under orders from Hanna. Is it, then, merely because the Democrats are acting upon honest convictions that the Republicans are so angry with them?

Ah, but the caucus! The Republicans have never fallen so low as to caucus on a treaty. But that is a dispute about a mere word. It is like Steele's repudiation of the claim of infallibility for the English Church; it was not infallible, it was simply always right. The Republicans in the Senate may not caucus, but they get the practical result just as if they did. This little pretence of theirs to superior virtue was pricked by Senator Teller in open Senate, a couple of years ago. He had been deep in Republican counsels before going over to the Democrats, and therefore spoke the thing he knew when replying to the taunt that the Democrats were more bound by caucus action than the Republican Senators. Mr. Teller dropped into suggestive reminiscences of the time when he was "on the other side," and neatly showed how the iron rule of the "steering committee," with the autocratic powers of Aldrich and Hanna and Allison, backed by the White House, resulted in a tyranny fully as absolute as that of the caucus. A part of what he said was:

> "Mr. President, the Senator from Wisconsin says they have no caucus. It is barely possible they have a leader on the other side who is so persuasive in his methods that he manages to secure the united body in a way that I will venture to say those who have had a long service in this body never saw the equal of before. In the last two years, or nearly so, there has been upon every question of any consequence, and innumerable questions of no consequence, a united Republican Senate, as we saw it the other day, with one single dissenting voice. Does any one in this country believe that every Senator who voted for that bill on the other side of the Chamber, save the one from California, voted for it willingly, cheerfully, and because of his conscience? Mr. President, we know very well the influence of party upon a vote of that kind."

The plain truth is that this afterthought protest of the Republicans is born of hypocrisy. They condemn in another what they have allowed in themselves.

A strictly non-partisan vote upon the San Domingo treaty the Republican managers would never think of invoking or allowing. They know that it would beat the treaty. It is perfectly understood that several of the ablest Republican Senators are thoroughly dissatisfied with the President's Dominican policy. Left to themselves, they would never think of voting for the treaty. They would not do so last year, much to Mr. Roosevelt's mortification, and some of them, at least, are unwilling to do so this year, even after the hedging and qualifications and explanations which he has made in the effort to placate them. As it is, if the treaty is got through at all, it will be solely to oblige the President and in consequence of party dictation. Yet the dictators are bewailing the abhorrent partisanship of the other fellows!

ELIMINATING ARMY OFFICERS.

Secretary Taft's bill to stimulate the flow of promotions in the army by an annual elimination of some of the least desirable officers in each grade, is the most important of his eleven reform measures transmitted to Congress last week. It is not intended that the number of men to be eliminated shall be fixed outright; the General Staff, which drafted the measure, merely says, for instance, that if the promotions of captains of infantry shall not in a single year reach a given percentage of the whole by reason of the ordinary casualties or retirements of the service, then a board shall be convened to retire the number of majors necessary to advance the required number of captains of infantry to their majorities. In its wording the bill is so technical and involved as to be almost beyond the understanding of a layman, but the principle behind it is clear. The army faces a great stagnation in promotions, owing to the number of young generals in high places and the increase of the army in 1901 by hundreds of young officers very much of an age. In what way shall this stagnation be averted?

President Roosevelt's plan to relieve it was to promote out of order annually a number of worthy officers by a process of selection. In that way, he thought, the brightest officers would be advanced rapidly enough to reach high rank at a period of life when they would still be vigorous and energetic. Although he has urged this plan in two messages, army opinion has almost unanimously rejected it, as is now proved by the substitution of the elimination process in the measure under consideration. Unfortunately for his cause, Mr. Roosevelt himself has been "selecting" officers for advancement to high rank out of order—notably Gens. Wood and Mills—and the result has been intense heart-burnings and dissatisfaction. The army is convinced that this power of advancing officers out of turn can, because of politics, never be intrusted to a Secretary of War, or to a President who has rate-bills and other legislation to advance; they are equally certain that politics and social influence could not be excluded if, as Mr. Roosevelt proposed, the se-

lection were to be made by a board of general officers. Such a board might be overridden by a President precisely as Mr. Roosevelt disregarded the recommendations of the West Point Academic Board and of the General Staff when he foisted upon the Academy a personal friend of the Cuban campaign, Capt. R. L. Howze, as commandant of cadets, in disregard of the wishes of the faculty. Finally, the opponents of selection point out that even if a board could be trusted to promote good men out of order, the resultant jealousies and discouragement of those overslaughed would be injurious to the service. Here, again, Mr. Roosevelt has furnished them with proofs of their contention.

Elimination, therefore, is now suggested in place of selection. On its face, the former is preferable; officers who have opposed the President's plan are enthusiastic over the new one. Undoubtedly, it would cause a normal flow of promotions. Moreover, it would weed out officers afflicted with dry-rot or whose personal failings or habits rendered their early retirement advisable; and by elimination must be understood retirement on a salary commensurate with the length of the service rendered, and not discharge or dismissal. So far so good. Unfortunately, the machinery of elimination must needs be the same as in the case of selection—a board of generals sworn to eliminate in accord with the best interests of the service. To this the first objections will be heard; an elimination board would seem to be open to the same dangerous influences as a selection board. Could it retire—to cite a concrete example—Capt. Pershing, son-in-law of Senator Warren, the mighty chairman of the Military Affairs Committee, if it found Capt. Pershing's retirement desirable? Would it disregard the claims of a son of a chief of staff when the members of the board were looking to his favor for that happy future in the army all officers desire? It is suggestive here to note that when a connection of the President was recently fined in a police court for drunkenness, he was not punished by the military authorities, as were two other similar offenders, and that when he was subsequently branded by an Ohio court as corespondent in a nasty army divorce case, he was allowed to escape merited dismissal by resigning.

At first, of course, elimination would be easy. There is a lot of deadwood, particularly among the hundreds of young officers put into the army in 1901. The misconduct of some of them gave the army an exceptionally bad court-martial record in 1905. Others, whose habits are exemplary, are temperamentally unfitted for the service or are without sufficient education. But if, after a few years of toning up, the elimination board were suddenly called upon to retire 6 of the 45 cavalry majors, it might easily find the choice not only extremely difficult, but in any event certain to terminate ruthlessly the careers of six vigorous, professionally capable men, any one of whom might have in him the latent ability of a Grant or a Sherman. How thoroughly hidden Grant's abilities were when he resigned as a captain in 1854, is a matter of record. And has the Government the right to create a class of able-bodied pensioners capable of giving valuable service?

From several points of view, therefore, the bill is objectionable, although the best of its kind so far produced. The condition of the army in 1898 shows that, even if there is stagnation in promotion, it may be kept essentially sound and have plenty of good men to call on in emergencies. And as Secretary Taft pointed out in his last report, there are several ways in which promotion can be stimulated without a prescribed elimination of given numbers. He asked then for legislation removing any officer who failed in any of the garrison or service schools, and added:

> "In my judgment, one possible and practical solution of the congestion and slowness of promotion that we are certain to have in the Regular Army, is in greater severity in the elimination of those who show themselves *at any stage* in their career unfit to bear the responsibility and enjoy the privileges of wearing the official uniform of the United States Army. This penalty, as applied to lieutenants, it seems to me, should be dismissal; as applied to field officers, it might be made retirement."

That this elimination process might be irrespective of the flow of promotion, is by no means an argument against it.

THE BALANCE SHEET OF CONSCIENCE.

That the last year has been a remarkable one in respect to the growth of "conscience funds" in national, State, and city treasuries, has been reported recently from a variety of sources. Only a few days ago the Philadelphia treasury received the largest donation of this kind in its history; the Treasury Department at Washington had some months before entered next to the largest item in the history of its conscience-book, while the familiar small attempts at restitution have been more than usually frequent. If to the sums thus paid into public treasuries be added those turned back by officers of fiduciary corporations, it is pretty certain that conscience never commanded so high a money value as at present.

The general interest which exists in regard to this curious feature of public finance has been explained on the ground that every human being either has conscience money properly due him, or else ought to pay it himself. At all events, there has been a good deal of speculation as to the causes of the access of *ex-post-facto* honesty. Some say it is due to new standards of militant honesty in public life, and cite the fact that, of the additions made to the Federal conscience fund during the last ten years, more than two-thirds have been recorded since 1901. Others, more cynically, point out that the fluctuations in these returns correspond almost exactly to the succession of good and bad years in business. People listen to inward monitions, according to this view, only when they can easily afford to, and the conscience fund is a more trustworthy barometer of prosperity than the iron trade itself. The effect of religious revivals is also said to be discernible in the older records, though no one puts this forward in explanation of the present activity.

All this could be decided if there were only clues to the motives operating in the individual acts of reparation, but in the majority of cases there are none. The man who has falsified his assessments, smuggled goods through the custom-house, overcharged on an expense account when in public employ, is more than likely merely to put the money in an envelope, write "conscience money" on a slip, and send it to the Treasury. So the majority of items are not merely anonymous, but blind. Those who are brought to repentance through religious feeling are naturally most likely to furnish details, and therefore probably would figure more conspicuously in a compilation of the letters of transmittal than in the entries of the fund itself. The two largest items at Washington, however, were evidently sent in by persons whose soul-searching was due to a religious impulse. In 1896 Consul-General Collins of London sent $14,225.15 which he had received from the Rev. Prebendary Barff, vicar of St. Giles's Church, in a suburb of London. The vicar himself would say only that one of his parishioners had handed him the money with the request that it be sent to the United States Government. This, the largest contribution up to the present time, still remains as mysterious as it was at first. The $12,000 contribution last year, which was in new $50, $100, and $1,000 bills, was accounted for merely by a note which said: "Years ago I defrauded the Government of money, but have returned it all, and now am paying fourfold, in accordance with the teaching of Scripture. The way of the transgressor is hard, and no one but God knows how I have suffered the consequences, and I would seek to do a bountiful restoration. May God pardon, while the United States Government is benefited." The signature "A Sinner" is a favorite one, though "A Penitent" and "A Lost Soul" are common enough to bear out the idea that religion is a frequent motive. A good many sums are forwarded by Roman Catholic priests.

The morbid sensitiveness of some consciences, as revealed in these letters, is

only less extraordinary than the periods for which their pangs have been endured. Stamps are constantly being sent, for instance, to pay arrears of postage which presumably had already been collected from recipients of mail matter years ago. "I enclose a one-cent stamp," wrote a woman, "for having sent a letter with only a one-cent stamp on it, not knowing it was wrong." "Enclosed find nine cents," said a man, "which I wish to refund, as I used cancelled stamps when it cost three cents to send a letter." Two-cent postage was established a generation ago. The people who send these postage stamps never stop to think that the easiest way of making the Government a small present is to buy a stamp of the appropriate denomination and tear it up.

From these the progress is gradual to the actual "freak" donations. "On bill forty-five years old, right party cannot be found," and "For fruit stolen when a boy," are typical of this class. Anything so businesslike as the conduct of the man who drove over from Canada, sold his horse, harness, and buggy, and years later sent, in succession, duty on all three, is rare. Apparently, the still small voice was not silenced by paying duty on the horse alone, so the tormented soul experimented to see if the buggy would not do, and at last, in despair, paid for the harness as well.

Since the first entry, made during Madison's Administration, the conscience fund at Washington—legally only an item of "miscellaneous receipts"—has received between $300,000 and $400,000. This, at present standards, would be enough to run the entire Government establishment for just about four hours; but how it compares with the amount of which the Government has been defrauded in the same time, had better remain unknown for the sake of national self-satisfaction.

THE TRACTION MERGER.

The amazing balance-sheet of the Metropolitan Securities Company published last week, apparently in the interests of the traction merger, must intensify the opposition to that combination on the part of public and shareholder. The expert accountants confessed their inability to arrive at a clear understanding of the actual situation. To analyze the exact status of the "holding company," the "operating company," and the real street-railway company was too much for them, as it has long been beyond the powers of the private investor to obtain any clear idea of this highly complicated financial arrangement. The most important gain from this report is the admission that the Securities company has been paying out large sums to make good the deficits of its subsidiary companies, and that the time when it will earn the guaranteed 7 per cent. dividend on the Metropolitan Street Railway stock is still far distant. As the accountants remark: "The Metropolitan Securities Company will be required to pay out a very large sum of money to make good deficits before it begins to earn a profit on its investment." In addition, there is the grave risk of "additional subway competition, from increased taxation, or from any other source."

Truly, if this is all that the friends of the consolidation can say for it; if this absurdly mixed and almost unintelligible balance-sheet represents the best efforts of those who would present the matter in its most favorable light, the public may well ask what would be left of the proposition after a search-investigation by a Hughes. It is not necessary to agree with an honest contemporary's view that "no other corporation in New York represents such many-sided iniquity," in order to see that in this instance high finance has revealed itself both stupid and shortsighted as well as double-dealing. The one hope for the public approval of such a consolidation lay in an absolutely clear and candid representation of the true situation of the various companies. If its managers had frankly confessed past errors of judgment, had laid bare their real predicament, and had then advocated a merger on the basis of the actual capitalization of the Interurban and the Metropolitan because of the great savings resulting therefrom, the public would at least have accorded them a respectful hearing and admitted the existence of some sound business reasons for the merger. When, however, the Belmont and Ryan interests, far from suggesting a reorganization on a sound basis, ask the stockholders to take a leap into absolute darkness and insist upon the further watering of an already badly bloated enterprise, their proposal becomes both an offence and a menace. It merits the universal chorus of condemnation with which it has been received.

Bad as is the plan from the point of view of the stockholders, it is, if anything, worse when examined from that of the public. There never was a clearer case of the failure of our great financiers to take warning from the signs of the times. Only by the skin of its teeth was the city saved from a Mayor committed to municipal ownership and management; as it is, there are many who sincerely believe that Mr. Hearst was actually elected. If there was ever a time when the street-railway magnates should have devoted themselves to giving the city a sound and safe management of its transportation lines and to the creation of new roads on the fairest possible terms, it was this year. They should have imitated the Pennsylvania Railroad and taken the public into their confidence. Instead, they have chosen a plan which has strengthened the municipal management propaganda. People to whom this policy is as distasteful as it is to ourselves are openly saying that, as between a stock-jobbing monopoly and street cars run from the City Hall, they prefer the latter. They would not feel so had not Mr. Belmont and his associates deliberately shaken public confidence in themselves and their undertakings. No American financier is strong enough or big enough to urge such a stock-watering proposition without losing prestige and standing. When in addition it appears that the whole transit future of New York is to be in the hands of men so indifferent to the public sentiment and interest, it is perfectly natural that there should be demands for legislative investigations, for laws forbidding the combination. If it is also the demagogue's opportunity, the Interurban and Metropolitan officials have only themselves to blame.

When the future is considered, there is every ground for uneasiness. Is there to be no competition for the enormously valuable franchises which must be awarded within the next four years? None is in sight now, and under existing laws the city cannot become a borrower to the extent necessary to build, much less to operate, the additional lines so urgently needed. Apparently, therefore, the city is bound and delivered to the monopoly about to be created. But if Mr. Belmont and Mr. Ryan think so, and see therein their warrant for getting the surface railroads out of a very bad financial hole by again capitalizing the future of their enterprises, they make a very sad mistake. The people will, sooner or later, assert their rights, even if they have to do it in ways which now seem repugnant. Some of them, who are stockholders in the Metropolitan and Interurban, may begin at once by refusing their assent to an indefensible and iniquitous combination.

ENGLAND'S PERIL.

LONDON, January 25, 1906.

The danger which impends over England is not Home Rule, though the Parliamentary independence of Ireland would in my judgment introduce dualism into the very centre of the Empire. It is not any risk of foreign attack, though England, like all powerful States, has foes enough. It is not the increase of taxation, which, according to many observers, advances with more rapid steps than the wealth of the country. It is not the advent of democracy, which, like a youngster just come of age, is determined to manage its own affairs without much reference to the teaching of experience. The danger which threatens England is the pauperization of the English poor.

The poor-law has always been the weak point of our social system; it has, indeed, from time to time facilitated the maintenance, if not of national harmony, yet of internal peace. Yet it has been a disease sapping the energy and independence

which are the true foundation of a country's well-being. All the wisest of reformers have felt that this is so. Men as different from one another as Bentham, Chalmers, and O'Connell, men who knew different parts of the United Kingdom, and looked at its inhabitants from very different or opposite points of view, saw that the poor-law threatened the country with evil. The great reform of 1834 was by its authors intended to be much more than a palliative. The diminution and the gradual prohibition of outdoor relief would be, it was thought, the first step towards the total abolition of poor-relief. This expectation has been disappointed. In 1834 it seemed likely enough that pauperism—that is, the existence of a large class depending for its support not on the labor of its members, but on relief, alias charity, doled out by the State—might within thirty or forty years come to an end. There is now no observer, whatever his own political or social faith, who expects that within the next fifty years workhouses and poor rates will be unknown. A man must indeed be an optimist who even expects that the growth of pauperism will, for the present at any rate, be as strictly restrained as it was during the thirty years which followed the reform of 1834. The checks upon the growth of pauperism have all and each of them been weaknened, and are likely either to be done away with or to lose their efficacy.

Consider the nature of these restraints, and the way in which their efficacy has been undermined. They were in part external—that is, they were legal arrangements deliberately framed to discourage the lavish granting of poor-relief, and to ensure that the condition of the pauper should always compare unfavorably with the condition of the independent laborer who lived, however hardly, on his own earnings. They were in part internal—in other words, they were opinions or beliefs which, being widely accepted, gave force to the action of the external checks. Of these checks three should be specially noted. The one was the control or direction of the poor-law by a central body which, under whatever name, aimed at curtailing the grant of outdoor relief; the second was the presence on every Board of Guardians of ex-officio members, who, from their position, were more likely to lighten the rates in the interest of the ratepayer than to favor the lavish grant of relief in the supposed interest of the poor. The last was the rule that a pauper could not exercise electoral rights; and that the man who received relief, or expected to receive relief, was not to have the right to determine what relief should be given, and the form in which it should be bestowed. Each one of these checks has been, if not actually removed, certainly rendered more or less ineffective.

Now that the English Government has become democratic, the Local Government Board, the action whereof greatly influences the principles on which poor-relief is distributed, wishes, like every other department of the Government, to gain popularity for the Executive with the electors. It no longer struggles to ensure the rigid enforcement of the principles of 1834. It now and again stimulates the liberality of Guardians, and encourages the idea that any respectable man who is out of work has the right to be relieved in the way least painful to himself. The Poor Law Guardians now may consist of the very class, or at best of men only just above the very class, which may any day require poor-relief, and inclines to think that pauperism is purely a calamity which ought to be relieved in the way least painful to the sufferer. Recent changes in the law itself have gone far to encourage, if not absolutely to necessitate, the granting of outdoor relief to persons who have still resources of their own. The receipt of poor-relief is still incompatible with the exercise of electoral rights, but this salutary rule has been broken in upon by ominous exceptions, and recent provisions for the relief of the unemployed have been so framed as to dissociate the receipt of money, which is in reality poor-relief, from the political disabilities which are still entailed upon a man who is technically a pauper. So much for the external checks. Their increasing weakness is itself a sure sign of the disappearance of the internal check—that is, the condition of opinion which retarded the growth of pauperism and to which alone the external checks owed their efficiency. Pauperism is ceasing to be a disgrace to the pauper; it is held to be the disgrace of the country which allows any man willing to work to be poor.

The causes of this state of public opinion are various, but they are none of them transitory. The Socialism represented by the election of Labor candidates is too natural a phenomenon in an old and wealthy country which has come under the rule of a democracy, to require explanation. The wonder is, not that the English electorate should pursue Socialistic ideals, but that the individualism derived from an older and aristocratic form of government should still exercise important influence. What is really noticeable is, that classes who cannot be numbered with the poor should no longer present a strenuous resistance to proposals which at bottom savor of Communism. The existence of this inertness is certain. Clergymen of the Church of England have hitherto been supposed to be by character and training the supporters of Conservatism. As regards Socialism, at any rate, many of them lean towards innovations which are at bottom more revolutionary than were the principles of the Jacobins, who, however despotic in their actions, were in theory enthusiasts for individual liberty and really respected the rights of property. Hardly two months have passed since the unemployed marched on a Sunday into St. Paul's Cathedral singing the "Marseillaise." They did not come to insult or brave the clergy; they expected to hear a favorite preacher, and, if they did not hear the man of their choice, the preacher for the day was not unsympathetic, and received the occasional applause of his audience. There is something curious in the thought that a sermon congenial to Socialism was delivered in the cathedral where little more than sixty years ago might have been heard a dignified address from Sydney Smith. The wisest, as well as the wittiest, of the canons of St. Paul's was a more effective reformer than any clergyman of to-day, but he would assuredly have delivered to a crowd clamoring for work—that is, for wages at the expense of the State—advice to rely rather on individual energy and self-help than upon any aid doled out to them from the public treasury. Politicians are a very different set of men from the clergy, but the two classes each derive their influence in modern England from sympathy with the wishes of the people. Hence politicians no less than preachers adopt as far as they can the popular ideas of their day. Such action in the case of persons anxious to obtain or to keep seats in Parliament occasionally raises a suspicion of insincerity, and a cynic may note with amusement that zeal for the attainment of objects desired by wage-earners rises almost daily with the increase in the number of Labor representatives who have obtained admission to the House of Commons.

But cynicism here, as in other cases, does not exactly hit the truth. In the excessive sympathy felt or avowed for the sufferings of the poor, there is much less of dishonesty than of self-delusion. The causes which favor sympathetic Socialism are complex. The high value which in the nineteenth century is set upon physical comfort, makes all of us look upon poverty as in itself a greater evil than it seemed even to the most humane of our grandfathers. Englishmen, again, have formed a really juster estimate of the moral harm done to the mass of the people through the lack not only of the comforts, but even of the enjoyments of life. The very conviction, too, on which the poor-law rests, that it is the duty of the State to ensure all its members against starvation, very naturally engenders the conviction among a highly civilized society that it is the duty of the State to see that every citizen, not guilty of crime nor of gross neglect of duty, shall be secured a tolerably comfortable existence. In all these sentiments you have at any rate the conditions necessary for the dominance, even among the wealthy, of Socialistic ideas.

Add to all this the advance of democracy, and then another feeling comes into play, to which thinkers who have concerned themselves with politics have never paid sufficient attention. A sovereign always finds flatterers, and his adulators come to believe seriously in the divinity of their idol. The deification of a Roman Emperor was merely the most striking example of an almost instinctive feeling which exists everywhere and at all times. This feeling is the natural aversion to separate power from goodness. Men know that an autocrat is powerful, they bring themselves to believe that he is wise and good. Wherever the people are sovereign, there with the mass of mankind will grow up the belief that the voice of the people is in some true sense the voice of God. If the English people, or rather the majority of the English electors, come to believe that every man has a right to be supplied with work, and work at fair wages, by the State, a mass of Englishmen, rich as well as poor, will rapidly adopt the faith that the wish of the electors is as wise as it is strong. In 1848 all England, which then meant the £10 householders, and the far wealthier class by which the £10 householders were guided, held the national workshops of France in derision. In 1906 all England, which means the whole body of householders and the class of rich men who know that political power can be retained only by pleas-

ing the whole body of householders, leans towards the very principles which brought the national workshops of France into existence. Moreover, the English poor have been for centuries accustomed to rely, in times when work is scarce and wages low, on parochial relief, and the English poor-law is itself a Socialistic institution. Can any one deny that the disastrous extension of poor-relief is in the highest degree probable, and that over England impends the danger of the pauperization of the poor?

AN OBSERVER.

THE SEPARATION OF CHURCH AND STATE IN FRANCE.

PARIS, December, 1905.

One can but be struck, in conversing with intelligent Frenchmen on the law which is soon to go into effect, with the sadness and even gloom of their views. It is not that they regard the separation of the Church from the State as in itself an evil; on the contrary, the most enlightened of the sincerely religious would rejoice if the clergy were freed from dependence on the Government. Nor is this at all a recent development, for, as long ago as 1830, Lacordaire denounced with fiery eloquence the *budget des cultes*. Between a priest paid by Government and one supported by the contributions of the faithful, he said, there is the same difference as between a mayor named by the State and one chosen by his fellow-citizens. Starvation is better than slavery; it is a pitiful religion that can live only by subventions. Montalembert declared: "We are paid by our enemies, by those who look on us as hypocrites or imbeciles." Even more explicit was Lamennais, who maintained that separation alone could put an end to relations as injurious to the State as to the Church. There is of course an element among the clergy desirous of maintaining the present status, which they find to their advantage; and there are many conservative people, such as one may still find in our own country, who cannot reconcile themselves to a government that ignores God. It is natural for such people to shrink from any disturbance of the established order; but it is not their vague timidities that are impressive.

To understand the melancholy apprehensions to which I refer, it is necessary to consider some of the events of the past. Before the Revolution the clergy was sufficiently dependent on the King; but the King was a good son of the Church. The Revolution, however, made a clean sweep of everything; there existed neither Church nor clergy. The title to the buildings of the Church, with the exception of those that had passed into private hands, became vested in the national and local governments, where it has ever since remained. For political reasons, Bonaparte reëstablished the Church; but it is to be observed that the Concordat speaks of the Catholic religion as that of the great majority of French citizens, not as the religion of the State. In fact, the advantage of situation lay with Pius VII.; but he was timorous, and Bonaparte bullied him into submission. Bonaparte was to nominate the bishops, the Pope merely to confirm them; and the bishops named the curés, subject to the approval of the Government. The consideration for this concession by the Pope was the payment of the clergy, the grant of the free use of the ecclesiastical buildings, and the practical monopoly of the lucrative business of burials. After his custom, Bonaparte altered the Concordat without the consent and in spite of the protest of the Pope, by the Organic Articles, which reduced the Church almost to the condition of a department of the Government. For a century this condition has substantially prevailed, although some of the claims of the Pope were allowed by the Bourbon kings and under the Second Empire, while the subvention of the clergy was considerably increased.

For twenty-five years, however, the tendency has been in the opposite direction. The religious orders were, of course, first attacked. Their teaching was forbidden, their revenues were reduced, and their property has now been practically confiscated. A few of the orders of women devoted to charitable work are tolerated, and, in special cases, teaching is still allowed; but, on the whole, it may be said that the congregations have been suppressed. The turn of the secular clergy soon came. Such exemption from taxation as they had enjoyed was practically terminated, and now the stipulations of the Concordat have been formally repudiated. The older clergy are promised life-pensions, not to exceed 1,500 francs, the rest are pensioned for from four to eight years. The Government proposed to rent the churches for religious purposes for a short term; but the Legislature decided to allow their free use, for the present, while limiting the term during which the other buildings may be used to five years. As to the other possessions of the Church, they pass into the hands of the Government, which is to transfer them, or what is left of them after the process of liquidation is completed, to certain new organizations, called Associations Cultuelles, We are familiar, in New England, with the religious society, as distinguished from the body of church members, and during the Unitarian controversy serious legal complications arose concerning the ownership of church property, the society often being Unitarian while the church remained orthodox. There have been secular organizations in France, called Fabriques, which concerned themselves with the management of the church property. These are abolished, and the new associations are to take their place. The law is so loosely drawn as to make complications inevitable; and as there may be many associations claiming the same property, it is not likely that the churches will hereafter have any considerable endowment. To make sure of this, the amount of endowment which they may accumulate is limited, where their revenue exceeds 5,000 francs, to three times that amount. The financial management of these bodies is subjected to the control of the Government, and whatever possessions they may acquire are to be taxed. Buildings and funds devoted to charitable as distinguished from purely religious purposes are transferred to charitable institutions managed by the Government. With the exception of the grant of the use of the churches, it may be said that henceforth the Government will do nothing for the support of religion.

Were it merely a matter of being deprived of revenue, it would be a cheap price to pay for freedom from the corrupting influence of Governmental patronage. The suffering will be severe—it is already acute—but it will be salutary. There is little hope, however, that the Government will cease to regulate the affairs of the Church. The law bristles with difficulties; it leaves for future decision all the most difficult problems. The administration of the law is in the hands of functionaries who hate not only the clergy but the very name of religion. The dispersion by force of 260 religious communities was a proceeding so barbarous that many magistrates resigned rather than participate in it, and it seems probable that all the wealth of these bodies—absurdly overestimated at a million of francs—will be wasted or stolen. The Fabriques were long ago forbidden to receive gifts for the schools of the Church, the priests have been expelled from the management of hospitals and charitable institutions, and in a hundred ways it has been made clear that the separation of the Church does not mean that its persecution is to cease. The attitude of the present Government was foreshadowed in Paul Bert's 'Manuel d'instruction morale et civique': "Dieu est un être qui ne se comprend pas, la religion un préjugé et une superstition que les prêtres exploitent à leur profit, l'athéisme un droit de l'homme, la foi dans le surnaturel incompatible avec le progrès de l'esprit humain."

Is it probable that a Government composed of men very many of whom, if not most, would subscribe to Paul Bert's creed, will allow the hated clergy to conduct the affairs of the Church without further interference? It is not to be expected. Men who cling to the old faith shake their heads sadly, and say, "In France, we do not know what liberty, what freedom of conscience, means." Even a person who might in his heart not altogether disagree with Paul Bert, cannot help sympathizing with these good people. They condemn the iniquities of the clergy, their cruelties, their corruption, their obsequiousness. Even the papal pretensions are commonly ridiculed by the faithful; but they may well feel sore and anxious when they know that they are at the mercy of a set of debased politicians who would gladly extirpate from the nation their most sacred convictions. So far as miracles go, it is only the first step that costs. The good Catholic takes more steps than his Protestant brother, but both of them accept the supernatural. There seems no reason to suppose that the religious instinct is to die out in man; do not the votaries of Christian Science count their millions? Persecution in the name of progress is nothing but a renewal of the infamous policy of the clergy in the dark ages. No good Catholics need expect political preferment, hardly even office, from the present Government; and that means a good deal in France.

At the best, the future of the Church is extremely uncertain; no one can yet tell whether the appointment of the clergy will not fall entirely into the hands of the Pope. If it does, it will be unprecedented if the Government does not interfere; if it does not, Frenchmen must develop a capacity for self-government that they have shown no sign of possessing. Yet it is possible that, out of the turmoil of persecution, of ugly passions and bitter enmities, there may arise a purer religion than any that France has yet known; purer in its clergy, purer in its laity, and eventual-

ly purer in its faith. The elements exist; you may hear homilies to-day that go straight to the heart, delivered by priests who are pure in heart to listeners who are sincerely devout, and at the same time full of intelligence. On the other hand, it is conceivable that the mass of the people may become completely irreligious, the lump being too large for the leaven. No one can foretell the event; but in France whatever happens is at least sure to be interesting. MacG.

THE GOLOVKINS.

PARIS, January 17, 1906.

It will be no easy task to write in future ages the history of Russia. Recent events do not give us a true understanding of the past, as they are themselves difficult to understand. Russia is still as she has been since she was born to history, in a sort of inorganic state; she is agitated by instincts which we are incapable of rightly appreciating; by forces which are not guided by intelligence; by vague aspirations which borrow at times the language of Eastern civilizations, but which hardly know their own aim. In the chaotic state of Russia, history cannot follow the lead of any definite policy; it has for its guide no constitutional laws; its sole resource is to fasten on distinct personalities that appear as lights shining in the darkness.

As a contribution to historical Russian literature, I may cite a volume just edited by Count Fedor Golovkin, under the subtitle of "Le Cour et le Règne de Paul I.: Portraits, Souvenirs et Anecdotes.' M. Bonnet, who writes the Introduction to this volume, tells us that he once saw in the old house at Monnaz, in Switzerland, several portraits representing members of the illustrious family of the Counts Golovkin—the Chancellor of Peter the Great, Count Fedor, Russian Ambassador to Naples, etc. The Chancellor was one of the ancestors of the proprietor of the château of Monnaz, and very valuable relics of the past, as well as the archives of the Counts Golovkin, found asylum in this quiet Swiss residence. They reposed there, unknown to the great public, for nearly a century and a half. Some extracts from these papers were published in 1900 by Lucien Perey in the 'Figures du Temps Passé'; and M. Bonnet gives us the memoirs of Count Fedor Golovkin, preceded by a summary history of his family.

The first Golovkin who appears in the modern history of Russia is Gabriel, a contemporary of Peter I., who became his Chancellor, after having first been a mere chamberlain. He was the first to receive in Russia the foreign title of Count. He often played a part in the orgies of the Tsar, a subject on which we find curious and not very edifying details in the inedited papers of Count Fedor Golovkin. There seems to have been a "council of the best drinkers," of which all the intimate friends of Peter I. were members:

"The rule of these orgies was a promenade round the table of Silenus, and none of the great ones was found more able to play the part than my great-grandfather. . . These were very rude fashions, but they were not Russian, and caused great scandal in the nation. The Reformer, finding the national drunkenness too vulgar, had it replaced by an exaggeration of old German customs, which his frequenting the booths and drinking-shops had revealed to him, and he regarded such saturnalia as a beginning of civilization."

There is not much to say about the Chancellor's children. The eldest led an obscure life at court. Michael, the younger son, was exiled after the *coup d'état* of the Empress Elizabeth. He stayed in Siberia with his wife a long time, and died there in profound poverty. His body was brought back to Moscow by his wife after Catharine II.'s accession to the throne.

"The Empress gave her four thousand peasants and a pension of four thousand rubles. She was hardly established in her father's house when she lost her eyesight. 'I asked her once,' writes Fedor in his memoirs, 'by what accident?' 'By what accident? Why! I had wept for twenty-three years.' "

She died at the age of a hundred years, remembering to the end in the greatest details the period of Peter the Great. She had conversed with Louis XIV. and Madame de Maintenon in the gardens of Versailles; she had lived in Berlin, in Vienna, on the frontiers of Kamtchatka, in the greatest affluence and the greatest penury.

The second son of the Chancellor of Peter I. was named Alexander; he made diplomacy his career, left Russia and never returned to it, notwithstanding the entreaties and offers of the Empress Catharine. His son Alexander was educated in Holland; he became possessor of the Swiss château at Monnaz, but spent the greater part of his time in a country house near Lausanne—still to be seen as it was inhabited for some time by Voltaire.

"Those were the *beaux jours* of Lausanne. Foreigners came from all sides, such as Gibbon, Voltaire, Servan, Razumovski, Prince Louis of Würtemberg. . . . Gibbon wrote the 'History of the Decline and Fall,' Voltaire organized a theatre, Razumovski was busy with natural history, Prince Louis of Würtemberg founded the Moral Society of Lausanne, an association whose members pledged themselves to mutual enlightenment by conversation and correspondence."

Golovkin lived there; he had married the daughter of Professor Lorenz von Mosheim. Frederick the Great tempted him to come to Berlin, and made him Director of Playhouses. He retained this post only two years and retired to Paris. He was a great admirer of Rousseau, and wrote an anonymous pamphlet, 'My Ideas on the Education of Women, or a Plan of Education for my Daughter.' He died in Paris in 1781. He had for many years kept up a correspondence with Paul I., then a Grand Duke, on philosophical and moral rather than on literary or political subjects. Of this there is unfortunately no trace left. His son George returned to Russia, as he could find no career for himself in France.

Count Fedor, author of the memoirs now published, was born in Holland, and was sent in 1778 to Berlin to be educated. "As the Dowager Countess of Kameke, my father's eldest sister," he says, "kept then the best house in the capital, I had occasion to study at the same time the sciences and the world and a little court—for the Princes of the blood often did her the honor to visit her." He describes in his memoirs the society of the court. Of Frederick the Great he says:

"He hardly leaves the sanctuary of Potsdam except for military manœuvres in various parts of his states. . . . Few travellers obtain the distinction of arriving through a sea of sand at the sanctuary, where genius occupies itself in creating resources where it seems there are none. These rare interviews are granted to celebrity rather than to worth, and partake of curiosity more than of esteem. . . . The great King, either from a superabundant superiority or an irascible pride, often willingly reduces to powder acts and thoughts for which one felt sure at least of a little indulgence. He shows somewhat more leniency to statesmen, but military and especially literary men rarely leave his cabinet without a scratch. In the midst of the pompous monuments of bad taste by which he has surrounded his retreat, the King lives as economically as his family, his generals, and his ministers."

The court of the great Catharine, where Golovkin was made a chamberlain, was more magnificent. He received his nomination as an answer to a request which he had made of her in French verse. His functions were agreeable. He traversed the Imperial palace as if it were his own. "Every four days, each person of the court received two bottles of all the known wines, and one of every sort of liqueur, which made, if I remember rightly, sixty bottles." There was really a single duty, which consisted in amusing the sovereign. Fedor was highly successful in this respect; he told her stories, read to her when she was half asleep in her bed, made for her charming vistas in the Park of Tsarskoe-Selo. The Empress confided to him the Embassy to Naples, but he mixed too much in the affairs of the kingdom, and wrote satirical verses on the Queen which made it impossible for him to remain there. He fell into disgrace, returned by short stages to Russia, stopping on his way in Venice with the Prince of Nassau-Siegen, and on his arrival was imprisoned in the fortress of Pernau. He was liberated at the death of Catharine, and the Emperor Paul I. made him master of ceremonies. He did not gain the good graces of his wild and capricious master, and in 1800 he was ordered to retire to his estates. He tells us, in a letter addressed to a friend, that he employed the year of his new exile in teaching the children of the village to read, and in writing a universal history.

His exile ceased on the succession to the throne of Alexander I.; from that moment he lived the life of a cosmopolitan. He spent the first years of the century at Dresden, where he became very intimate with Metternich. We find him in 1804 at Berlin, where he was patronized by the beautiful Queen Louise. After the peace of Tilsit, he established himself in Paris.

"I had here," he says, "great successes in society, which in France is decisive of so many things, since by my manners, my language, and even my defects I was eminently French, and my political nullity removed all constraint from the kindness with which people treated me. Placed at once in the midst of the best society, I seemed like a plant of the soil, and a plant cultivated in the fine days of the old society."

I shall not follow him to Switzerland, to Florence. Wherever he went, he took pleasure in writing, having a number of correspondents. He was a very agreeable *causeur;* at times he tried his hand on political questions, and wrote, among other pamphlets, 'Considerations on the Moral Constitution of France.' His memoirs are the most important part of his work, and in them the most interesting chapters are the recollections of the court and the reign of Paul I. They deserved to be published, and M. Bonnet's Introduction is a very valuable

chapter of history. Count Fedor appears in it as a type of a class of Russians who felt the influence of French ideas and of Occidental civilization, and who formed an exceptional élite, deprived of all political power, the ornaments, not the real inspirers and supporters, of autocracy.

Correspondence.

KEATS AND HIS INTERPRETERS.

To the Editor of The Nation:

Sir: My attention has just been called to Dr. Garnett's interesting letter to the *Nation* of December 21, on Keats's "beautiful line":

"Clasp'd like a missal where swart Paynims pray."

May I, even at this late hour, offer some remarks on the subject? I must confess that, to my mind, this beautiful line ought not to be called beautiful, because it fails in its object, even granting that it means anything at all.

The object of a comparison is, we are taught, to make matters more striking and clear. When Shakspere tells us that Hamlet's revenge will be swift as "the thoughts of love," we all know what is meant; the comparison is as clear as it is beautiful. If we had been told that Hamlet would move as swiftly as a pterodactyl, the comparison would not have been beautiful, because obscure; few people know what a pterodactyl is; fewer have fixed ideas as to its slowness or rapidity, which have not been recently tested.

Keats's line, in his otherwise splendid stanza xxvii., is, I blush to say, "pterodactyl" to me. The poet's intention is to make us understand the state of Madeline, "in her soft and chilly nest," when, at last,

"——the poppied warmth of sleep oppress'd
Her sootbed limbs."

He describes her in different ways, and, among others, as being, as we said,

"Clasp'd like a missal where swart Paynims pray."

For the comparison to be clear, or indeed to mean anything, it should be notorious that missals are to be found clasped in Paynim land. But they are not, and never were. Clasped or no Paynims keep no such books, and no one has ever believed that they did. So that the means chosen to make us understand in what particular way Madeline was "clasped," far from giving us any light, leaves us in greater darkness than before: witness the conflicting interpretations of the wisest and cleverest critics.

Let us even assume that the words have the sense, and that the poet had the intention, alleged by Dr. Garnett: the line will not be better, nor the comparison more appropriate. The occasion is Madeline's sleep, which is to last, at most, until morn, and which in fact lasts much less. How can she be properly "compared," to use Dr. Garnett's own words, "to a shut missal, . . . with the heightening circumstance that not only is the missal shut, but it is shut in Heathenesse, where it will never be opened"? If so, the comparison should have been reserved for the time when Madeline's eyes would "never be opened" again—the time, not of her sleep, but of her death.

It was a fault only too common among the lyricists of the nineteenth century to string together beautiful words, suggesting, at most, a meaning, rather than having any. More than one line of this sort is to be found in Musset, a fault to be condoned, not praised.

Recalling the trouble given to literary connoisseurs, in past times as now, by Keats's line, Dr. Garnett mentions the sad case of Philarète Chasles, who, wanting to translate the passage, went absolutely astray, replaced one word by another, and, not knowing what to do with the epithet "swart," quietly suppressed it. To do so, observes Dr. Garnett, is to meet the difficulty "in true French fashion." From the pen of such a scholar such a generalization may surprise. What Chasles did deserves all blame and is quite wrong, but has nothing especially French. In giving a new edition of an old text (Matthew Paris's 'Cbronica Majora'), H. R. Luard wrote thus of a predecessor: "He has not the slightest scruple in altering what he does not understand, or changing words or expressions that he does not like." The predecessor Luard alludes to was not a Frenchman; he was Archbishop Parker.

Jusserand.

Washington, D. C., January 31, 1906.

OUR SLOVENLY SPEECH.

To the Editor of The Nation:

Sir: Your correspondent, in this week's issue, who writes on current oral English touches a responsive chord. We have lately heard much of the Gaelic movement, and there is enthusiasm in the effort to revivify the beautful Irish speech, for long time in languishment. But surely here in America there is present need of an apostle of English—an American Hyde—who will lead a crusade in behalf of the revival of our mother tongue. Mr. Henry James sounded the tocsin in his address last summer at Bryn Mawr. He is competent to lead, but has forsaken us and fled with hands to ear.

As he points out, the sad thing is, indeed, the absence in us of the consciousness of sin. People whose grammar is of the schools, whose complacency is supreme, whose means assure them the conventional elegancies of life, are tone-deaf to the unhappy sounds they emit as human speech. One hears people of scholastic culture in Northwestern college towns, for example, discourse learnedly of Athenian philosophy while they burr their *r*'s in the most hopelessly Theban way; and then these same people are heard to observe that, whatever the dialectic peculiarities of New England or the South may be, there is nothing distinctively peculiar in their own speech! Alas, their speech bewrayeth them. Here and there, indeed, throughout the land we may hear a voice of "Englishe undefyled," but it is the voice of one crying in the wilderness.

Respectfully,

Henry Leverett Chase.

St. Louis, January 27, 1906.

A PLEA FOR INDIRECT DISCOURSE.

To the Editor of The Nation:

Sir: Among the changes in the English language for which American newspapers are responsible is the decrease in the use of indirect discourse in the reporting of conversations and public addresses. The prevailing appetite of editors for interviews in the form of dialogue or monologue compels the reporter to dress up in quotation-marks sentences and paragraphs which may represent well or ill the ideas of the person quoted, but which, being based on the reporter's memory or at best his longhand notes, cannot possibly be what they pretend to be, namely, the exact language of the speaker. I do not complain of those newspapers whose frankly avowed object is to deck out all their news items in the smartest language possible, without regard to either original facts or original words; if they wish to clothe the alleged ideas of college professors, prize-fighters, and shoplifters in the uniform elegances of reportorial English, their readers, being sometimes diverted thereby and rarely deceived, have no grievance that I feel called upon to present. On the other hand, many newspapers that are governed by the motive of giving the public accurate reports have come so far under the influence of these sprightly purveyors of fictitious news as to put pressure on their reporters to serve up no news that is not spiced with interviews, and no interviews that are not garnished with the symbols of direct discourse The result is that one rarely finds in an American newspaper a quotation of any length in indirect discourse, and one is led to doubt whether one reporter in ten could execute a paragraph of it without doing violence to its proper moods and tenses.

The average person seeking to reproduce from memory the statements of another succeeds best if he devotes himself to mastering the ideas rather than the mere words of his informant. An interviewer who patches together such words and phrases as he can remember in order to make a connected statement in direct quotation, is not so likely to reproduce faithfully the thought of his informant as he would be if he did the best he could with his own words in indirect discourse. Moreover, the person interviewed is usually as averse to masquerading in language not exactly his own as he is to wearing another person's clothes. Given the exact words of a speaker, the choice between direct and indirect discourse may well be made in favor of the livelier form; but when the only possible thing is to repeat the sense or general purport of a statement, or when it is obviously necessary to summarize a long passage in a few sentences, indirect discourse, which clearly limits the responsibility of the original speaker, is surely the only honest method of quotation. A careful observance of this principle would give our newspapers much freer access to the confidence of public men, many of whom, exasperated as much by the English put into their mouths by false quotation-marks as by the misrepresentation of their ideas, utterly refuse to "talk for publication," although their opinions may be reasonably desired by the public.

It is not necessary that our reporters should copy the English newspapers to the extent of laboriously turning long verbatim reports into indirect discourse for purposes of publication; but they would do well to exercise their pens in that fashion now and then if they would not lose the use of

an indispensable implement of expression.

I am, sir, etc., J. D. GREENE.

CAMBRIDGE, MASS., January 31, 1906.

THE EGYPTIAN RESEARCH ACCOUNT.

TO THE EDITOR OF THE NATION:

SIR: Your valuable review of Capart's 'Primitive Art in Egypt' (p. 104, Feb. 1) alludes to the "Research Account of the Egypt Exploration Fund"; and as there is much misapprehension concerning the Research Account, and I have many inquiries to answer about it, let me state that the "Egyptian Research Account" society has no connection with the Fund society. It is practically an entirely new society, and its organization, of recent date, has Sir John Lubbock for president, and over forty persons eminent in scholarship, official and civic position, or the like, for its committee. Professor Petrie, no longer connected with the Fund, is field director, and the continuance of his researches will now depend entirely upon the contributions to the "Research Account," as the circular states. The honorary secretary in London writes to me: "Professor Petrie's work has been so well supported in the past by his American friends that I feel quite sure we can look forward to a continuance of their favor; for I am certain that your frank appreciation of the grand work that he has done in Egypt is shared by very many of your countrymen."

I have already sent over many subscriptions, and I beg to add that I will gladly forward all subscriptions of not less than five dollars each (which entitles to the illustrated volume of the season) to this splendid cause in the hands of a master famous for his economy and skill. I have subscribed $25; and I pay every cost, so that *all* may go intact to Petrie's direct work *in situ* and the publication of the results.

(Rev.) WILLIAM COPLEY WINSLOW.

THE HONOR SYSTEM IN SOUTH CAROLINA.

TO THE EDITOR OF THE NATION:

SIR: Prof. W. L. Stevens, writing on "The Honor System in American Colleges" in the February number of the *Popular Science Monthly*, refers to the early date of the establishment of that system at the South Carolina College. Permit me to give, through your columns, a few pieces of evidence in proof of his statements.

The honor system was here a growth. The first president, Jonathan Maxcy, a native of Massachusetts, had the board of trustees, at their meeting on the 19th of December, 1804, adopt as the basis of discipline this section (article vii. of the by-laws published at Columbia, S. C., 1805): "The rewards and punishments of this institution shall be all addressed to the sense of duty, and the principles of honor and shame." At the death of Dr. Maxcy in 1820 Prof. Robert Henry delivered an address, published in 1822, in which he said that Dr. Maxcy "appealed to the honor of his pupils, and required a faithful compliance with conditions which they themselves had voluntarily undertaken to perform."

In 1823 a most serious offence committed in the college chapel was the occasion of an investigation, the method of procedure of which shows that the honor system had by this time developed almost to the degree existing at the present. All students were required to answer whether they had committed, or had been accessory to, the offence in regard to which the faculty was conducting the investigation. The minutes of the faculty for April 10, 1823, have this comment: "Answers [*denials*] were given by the following students, who, of course, were considered as exonerated and allowed to retain their standing." By 1836 a regular method of procedure had been established. A student was not expected to incriminate any one else by his evidence. If he denied that he had anything to do with the offence of which he had been charged on reasonable presumptive evidence, he was regarded as *prima facie* not guilty; if his denial was afterwards found to be not true, he was expelled for lying.

Between 1807 and 1848 there were at least two editions of the by-laws of the College, but no copy is accessible, so that I have determined the dates 1823 and 1836 from the MS. minutes of the faculty, which are preserved in the College Library.

Very truly yours, EDWIN L. GREEN.

SOUTH CAROLINA COLLEGE, COLUMBIA,
January 26, 1906.

Notes.

Further spring announcements by the Macmillan Company are a 'Memoir of Archbishop Temple,' in two volumes; 'Persia, Past and Present,' by Prof. A. V. Williams Jackson, with numerous illustrations; and 'Kaempfer's History of Japan in 1693,' translated in three volumes by J. G. Scheuchzer.

G. P. Putnam's Sons will shortly issue 'From a College Window,' a collection of serial papers from the *Cornhill Magazine*, with six essays not before published, by Arthur C. Benson, author of 'The Upton Letters.'

The Burrows Publishing Company, Cleveland, announce the extension of Avery's 'History of the United States' from twelve to fifteen volumes. Original subscribers will have the three last gratis; subscribers to the fifteen may similarly find themselves presented with a sixteenth (*i. e.*, the index volume, unless that be the fifteenth).

Mr. E. F. Henderson's 'Short History of Germany,' which on its appearance four years ago we judged to be the best in English for that part of it (the main) treating of the period between the beginning of the Reformation and the establishment of the German Empire, has been brought out in a single volume by Macmillan.

Messrs. Longman's school edition of Palgrave's 'Golden Treasury' will certainly find favor. Mr. Herbert Bates has freely handled the compiler's notes, and added his own. The general reader may disregard both in pursuit of the poems alone. There is an index of first lines, and a conspectus of the contributory poets.

The parent 'Who's Who' for 1906 (London: Black; New York: Macmillan) boasts its 58th year of issue and of usefulness. Its newest wrinkles are an enumeration (not naming) of sons and daughters, and indication of motor and telephone numbers and telegraphic addresses. Now that American, German, and Italian copies of 'Who's Who' are springing into existence, the advisability of cleaving to British "somebodies" alone is worth considering, in view of the growing bulk of the work.

A stately 'Deutsches Zeitgenossenlexikon: Biographisches Handbuch deutscher Männer und Frauen der Gegenwart' (Leipzig: Schulze & Co.; New York: Lemcke & Buechner) follows close upon the heels of the smaller and more nimble 'Wer ist's? Unsere Zeitgenossen.' Eight hundred pages in the German letter now compete with one thousand and upwards in Roman type; and if the latter seems an advantage for 'Wer ist's?' it is offset by a minimum of abbreviations in the Lexikon. Further comparison shows a wider range in 'Wer ist's?'—the Lexikon's choice of eminent contemporaries being rather strictly confined to the German Empire, though exceptions have been made in the case of certain Austrians and Swiss. Page one in the two works has ten notices for 'Wer ist's?' against four for the Lexikon, and only two are in common. The information contained in these is substantially identical. It appears, therefore, that a shelf supplied with both these dictionaries of contemporaries will be richer than with either alone; but we fear the cheapness and portability of 'Wer ist's?' may seriously affect the publishers' purpose to make an annual of the Lexikon. Few of its notices exceed half a column, and the Emperor Wilhelm gets no more space than Sudermann; both less than Paul Heyse, thanks to his literary productivity.

'Napoleon's Love Story' (Dutton) is a novel by a Polish author, Waclaw Gasiorowski, translated by Count de Soissons. It breathes history at every pore, for even in the translator's preface we are thrilled by the information that in 1863 [*sic*] twenty-five thousand Polish horsemen defeated 300,000 Turks under the walls of Vienna! The author is looked on by his countrymen as the champion of the school of writers who follow Sienkiewicz, and his book may therefore appeal to some of the readers of 'Quo Vadis.'

Mr. Ernest Radford remarks, in the prefatory text of the volume of the Newnes Art Library devoted to Rossetti (Frederick Warne & Co.): "Whilst the quality of the original must necessarily be lost in the reproduction, the design is at any rate there, by means of which we are brought almost as close to the artist on his intellectual side as we should have been by the original, and, with illustrations so arranged as to take us through the stages of his career, are not altogether without guides." This is a fair statement of the usefulness of such books of reproductions if they only were "so arranged as to take us through the stages of a career," but for some reason the publishers persist in ignoring this or any other visible principle of arrangement, and to follow Mr. Radford's chronological account of Rossetti's work you must go skipping through the plates hunting for the one you want, and lucky when you find it.

M. Arsène Alexandre takes the tone of personal reminiscence in the introduction to the volume on 'Puvis de Chavannes' in the same series; and though he has little

of importance to tell us, that little is first-hand information, not mere compilation. By a curious blunder the detail plates of the "Ludus pro Patria" credit that decoration to Rouen, though the small ensemble plate gives the correct ascription to Amiens.

It was, perhaps, hardly to be expected that Mrs. Ady (Julia Cartwright) should make of her 'Raphael' in the Popular Library of Art (London: Duckworth; New York: Dutton) such an original piece of analysis or so illuminating a biography as one or two other little books in this useful series. Pretty much everything has already been said about Raphael, and all that a writer can hope to do is to give a rational and well-balanced résumé of accepted criticism and acknowledged fact. This Mrs. Ady has done acceptably, and the volume is a worthy successor to its forerunners.

In 'The Modern Trust Company' (Macmillan), F. B. Kirkbride and J. E. Sterrett offer us the first detailed account of the organization and operation of trust companies. As such, the book supplies a genuine want, and should receive a hospitable reception. The authors have made a careful study of the distinctly technical side of their subject, and have produced a book similar in its general features to the best works upon what is usually called "practical banking." But, to the larger economic problems caused by the rapid development of trust companies, the scantiest attention is given. The authors do well to show the desirability of having adequate cash reserves maintained by companies engaged in an ordinary banking business, but they should have devoted more than three pages to this important and timely subject. They do well, also, to point out the importance of frequent public statements of the condition of these institutions, yet merely touch upon the topic, which ought to have received extended treatment. In future editions, it is to be hoped that more attention will be given to these larger questions of public policy. The care and judgment with which the rest of their work is done, justify the belief that our authors are competent to deal with the broader aspects of their subject. As their book now stands, however, it fails to give us all that we have a right to expect from a comprehensive treatise upon trust companies.

Charles A. Conant's 'Principles of Money and Banking' (Harper & Bros.) is a comprehensive treatise, parts of which have already appeared in economic and financial periodicals. It is not written for the purpose of demolishing the "quantity theory," extirpating the bimetallist, or advocating an "asset currency," but is devoted to irenic exposition rather than polemical discussions. Withal it is written clearly and interestingly, and should prove a useful work of reference at many points. Viewed as a systematic treatise, however, the critic's verdict cannot be wholly favorable. Mr. Conant has read widely the English and French literature on his subject, but has made no use of the German. He has not always discriminated between what was novel to him and what would be new to a well-informed reader. His pages are encumbered with superfluous quotations upon unimportant topics, which he could have dismissed equally well with a few words of his own. His historical chapters are sometimes painfully inadequate, and his treatment of theoretical subjects not always satisfactory. He is at his best in the discussion of various practical topics with which he has had wide and varied experience; elsewhere, many of his chapters do not rise above the level of the commonplace. With conspicuous merits and serious defects, the book will be held in varying estimation by different readers and critics.

Gannett, Garrison, & Houston's 'Commercial Geography' represents still another attempt to meet the demand for a text-book on trade. It registers an advance over some of its predecessors in that it lays distinct stress upon the physical and social conditions of commerce; in other words, it reduces more nearly to their relative importance the statistical materials which formerly well-nigh made up what posed as commercial geography. But this process is carried out in the present volume, as it seems to us, in a degree still insufficient. Considerably over half of the material is statistical, and is set off by itself instead of being interspersed in the more general and philosophical part, either directly or by cross-reference, by way of immediate illustration of principles there set forth. Statistical materials always afford difficulties to the student, and especially to the schoolboy; and it is only by the most skilful use of the nucleus-principle that any life can be put into them. Pedagogically, then, this book is still defective; and as for the scientific discussion of the conditions of commerce, this seems incomplete and insufficiently systematic, and in many cases too condensed. The treatment varies between passages of complex implication and others of a more suitable simplicity. It is to be feared that the teacher himself, unless specially trained along these lines, will have trouble in extracting from this book the new point of view.

A foreign work upon the same subject (Eckert's 'Grundriss der Handelsgeographie,' Leipzig, 1905) comes nearer to a scientific treatment of the subject than any other we have seen. Practically, all the essential principles of the influence of environment are rehearsed in the first volume, together with apposite examples. All the more purely local and statistical matter is referred to a second volume. If the book were more attractively set up, with larger and less crowded type, the impression of dull *Gelehrsamkeit* which it gives would be to a great extent removed. In the hands of a skilful translator permitted to omit, paraphrase, and manipulate, Eckert's work could be made into a text-book considerably superior to any we now have in English. As it stands, it is a valuable reference volume for any one who teaches the subject.

The fourth volume of the 'Jahrbuch der deutschen Bibliotheken' has just appeared, containing the usual lists of libraries and librarians in the German Empire, statistical tables, and new statutes and regulations. Among the latter we find the new Royal Ordinance regulating the appointments to the higher library service in Bavaria. The chief library in that country is the Hof- und Staatsbibliothek in Munich, and the second half of the apprenticeship which all would-be librarians must serve must be gone through there, while in case of the first half the candidates may choose between that library, the university libraries, and a couple of other specified institutions. In addition to the apprentice work, the candidates must attend lectures in the history of printing and the book trade, in palæography, library administration, and bibliography. Since the publication of the previous volume, two libraries have joined the international library loan system, namely, the Public Library of Geneva, Switzerland, and the library of Columbia University in New York, the latter being the first American institution to join.

The first annual volume of the 'Annotationes,' issued by the Concilium Bibliographicum in Zurich, has just been completed. It contains, besides the report for 1904 and sundry notes in regard to the card indexes of the Concilium, reprints or abstracts of a number of "Articles dealing with the Concilium Bibliographicum and its Work," in continuation of the bibliography of such articles during the years 1893 to 1904, also found in this volume. The latter is partly reprinted from the Bibliography of Coöperative Cataloguing and the Printing of Catalogue Cards presented as a thesis to the School of Library Science of the University of Illinois by Messrs. T. Jahr and A. J. Strohm, and printed in 1903 by the Library of Congress. The most important announcement of the Concillum itself is that in regard to the resumption of its card bibliography of physiology, accompanied by an excellent study of the proper scope of a bibliography, the completeness to be attained, the arrangement of the material, etc.

The *National Geographic Magazine* for January contains as its first article Gen. A W. Greely's address on geographical exploration, delivered at the Carnegie Institute in Pittsburgh. This is followed by an entertaining account of the Florida Keys and their products by John Gifford. A railroad to Key West is in process of construction, binding the different Keys together like a string of pearls. The writer, who has a plantation on Elliott's Key, from which he picked in one day cocoanuts, bananas, limes, pineapples, papaws, sapodillas, sugar apples, sweet potatoes, tomatoes, eggplants, and peppers, prophesies that they will soon be the site of many winter villas and gardens. The greater part of the remainder of the number is devoted to a report of the speeches delivered at the annual dinner of the National Geographic Society, but fitted for the columns of a newspaper rather than for what purports to be a scientific journal. The new department of geographical squibs is also to be regretted as a further lowering of dignity of this periodical. Many of the illustrations, interesting in themselves, have no reference to anything in the text, but seem to be inserted to increase the bulk of the number.

Petermann's Mitteilungen, No. 11, has for its article of most general interest an account, by Alb. Grubauer, of an expedition into the interior of the Malay Peninsula made for the purpose of studying the few remaining aborigines. After much difficulty he was able to find one of their villages. He describes the inhabitants as scarcely middle-sized, but well formed and excessively shy, evidently resembling strongly, in this as well as in their habits of life, the pygmies of the Central African forest. The other leading contents are a

summary of our present knowledge of the Antarctic Ocean, and a description of the hurricane which last June raged in the Marshall Islands, both accompanied by maps. There is further a report of the proceedings of the third international Glacier Conference, held in the Engadine in September, 1905; Prof. H. F. Reid of Johns Hopkins being the presiding officer. In No. 12 Theodor Strauss gives an account of a recent journey in the province of Luristan, western Persia, which was both difficult and dangerous from the utter lack of an organized government and the consequent lawlessness of the people. "Robbery and plundering is the order of the day here," a Persian prince said to him. A lengthy summary of Penck and Brückner's work on the Alps in the Ice Age, and an interesting table of the different nationalities or peoples in the Russian Empire in 1897, deserve notice. The leading race is of course the Slav; then comes the Turco-Tartar, while third in rank are the Jews, who number a little over five millions.

The annual list of new and important works added to the Boston Public Library is much larger than that of previous years. The greatest increase has been in works on the useful and industrial arts, and this shows both the present trend of mental activity and the aid which a public library can give towards developing the productive powers of an intelligent community. There has been an increase, too, in works on the fine arts, education, and science, with a falling off in works on general literature. A new and most useful departure is an author-index containing some 7,500 names, and if there was also a subject-index there would be little left to be desired.

Major von Brug, a recognized authority in the department of aerial navigation, has presented his library on this subject, exceptionally rich in historical and descriptive works, to the Deutsches Museum of Munich. German journals pronounce this the best collection of books, charts, maps, etc., on the subject in the Empire, if not in Europe.

We have already spoken of the municipal purchase of the house in Odense where Hans Christian Andersen was born April 2, 1805, for the purpose of transforming it into an Andersen House, in which may be preserved objects associated with Denmark's best-known writer. By the help of early drawings, both the exterior and the interior will be restored to their original appearance, and the Danish public is now called upon to contribute material for its furnishing. Valuable objects have already been presented by the Collin family, Andersen's most intimate friends, the composer Edvard Grieg and others, and the local committee has purchased a set of furniture used by Andersen for twenty years and the 109 original drawings for the 'Wonder Tales' by Wilhelm Pedersen. It is safe to say that no similar undertaking, with the exception of the Shakspere birthplace, will appeal to a larger number of persons throughout the world; and if every one who has had his childhood days brightened by the works of this Danish genius would contribute a penny, the committee of Odense citizens would have a large amount at their disposal.

The Cape-to-Cairo Railway has been constructed to the Kafue River, 260 miles beyond the Victoria Falls. At the present rate of progress, a mile a day, the Broken Hill zinc and lead mines will be reached in June. Then there will be uninterrupted communication by rail with Cape Town, 2,015 miles distant. The next point aimed at is a rich copper area on the Congo State border. The railway, according to Sir Charles Metcalfe, who has just returned from a preliminary survey of the country between the railhead and the Free State, is a great peacemaker. The whole of the region, he reports, is tranquil and secure, presenting a great contrast to the condition of affairs a few years ago. The natives are now free from the raids from which they suffered, and enjoy security of property.

The highly respectable position which the Equal Suffrage movement has now attained to is evidenced by the fact that at the annual convention which begins its sessions to-day in Baltimore (February 7-13), meetings will be presided over by President Remsen, Dr. Welch, and Mayor Timanus, and addresses will be made, among others, by Governor Warfield and Secretary Bonaparte. Miss Anthony will celebrate in Washington on February 14 her eighty-sixth birthday.

—In the February *Atlantic*, William Everett discusses the United States Senate with his usual vigor, chiefly in respect of its usurpation of power rightly belonging to the Executive. Such discussions are comparatively useless, however, so long as Presidents continue willing to barter Constitutional prerogatives for the furtherance of favored measures through Congress. Taking the history of the country as a whole, the Presidency is hardly less culpable than the Senate in disturbing the proper balance of power. Dr. Everett has no faith in any scheme to improve the Senate by Constitutional amendment providing for popular election. The Constitution, he thinks, should remain practically unalterable. Have we not discovered, however, that there are other and easier ways of alteration than amendment? Andrew D. White returns to his studies in the "Warfare of Humanity with Unreason," presenting in this issue the first part of a paper on Turgot, "a great thinker, writer, administrator, philanthropist, statesman, and, above all, a great character and a great man," though a failure by ordinary standards of judgment, since he was driven speedily from his culminating position and lived "only long enough to see every leading measure to which he had devoted his life deliberately and malignantly undone." On the purely literary side, William C. Hazlitt's presentation of new "Eliana" is the most attractive feature, though those of us who used to enjoy 'Dream Life' and the 'Reveries of a Bachelor' in simpler days may thank Mrs. Annie Russell Marble for a chance to take a half-hour from "doing things" for a study of the charm of "Ik Marvel."

—Dr. Nevinson's closing paper on the "African Slave-Trade" in *Harper's* scarcely attains the sensational character suggested in the advance notice of a month ago. He has proved clearly enough what people who have cared to look into the matter already knew—that the slave-trade exists to-day, with all the hideous characteristics which it has had in the past, and must ever have. Whether we shall find the way out without the rise of a new band of agitators, as single-minded, as resolute, and at the start as obnoxious to the feelings of the majority, as were the American Abolitionists of seventy years ago, is somewhat doubtful. Abbey's illustrations of "Julius Cæsar" are accompanied by Harold Hodge's critical comment, parts of which recall some of Swinburne's comments in previous numbers of the same series. To be told that Calvary alone can surpass in awe the murder of Julius Cæsar can hardly strengthen one's faith in the competence of the critic. One disposed to scent imitation easily might recall here the similar outburst of F. Marion Crawford that Brutus, in murdering Cæsar, "blackened the name of friendship with a stain that will outlast time, and by a deed second only in infamy to that of Judas Iscariot." Such criticism elucidates the critics rather than the dramas of Shakspere or the facts of Roman history. The Easy Chair is at its best in discussing Mr. Holt's recent paper on the "Commercialization of Literature." It is only the publication of literature that is commercialized. The author, even when tempted from one publisher to another by higher royalties, of course maintains his artistic ideal, and so his literature is as free of the money taint as ever, "just as the heart of a lady released from its allegiance by the divorce court is as essentially true as ever, and may be so transferred to a new object of devotion."

—The *Century* has chosen to make the memory of Keats its chief mid-winter feature. A paper on the "Portraits of Keats," by William Sharp, is accompanied by a dozen illustrations, half of which are from the various portraits by Joseph Severn. Mr. Sharp seriously questions the genuineness of many miniatures of Keats generally attributed to Severn, giving instances of bold attempts to dispose of forgeries under his name. Mr. Gilder tells of a visit to Severn, in his apartment at the Fountain of Trevi, in 1879, where he first saw the life-mask of Keats's face, a copy of which he brought to America. Another copy he gave to Philip Bourke Marston, and through these two copies, used for illustration in the editions of Keats by Buxton Forman and John Gilmer Speed, the mask has become widely known on both sides of the water. A striking illustration of the delicate touch of Helen Keller was furnished by this mask. Upon passing her fingers over the face, in Mr. Gilder's presence, she immediately said, "He smiles." Now, the smile, which undoubtedly exists, is so slight that many would not recognize it at all from the reproductions on paper, and Mr. Gilder states that it can be perceived by the eye in the mask itself only when the light is rightly adjusted. President Spencer's plea for the railroads in the January number, as against a Federal rate-making commission, is counterbalanced by a paper on the other side from Charles A. Prouty, of the Interstate Commerce Commission. It is easy to point out the sins of railroads, and this he does, with evidence which must be convincing were there anybody still to convince. What one misses, here as everywhere else, from the President's utterances down, is any valid proof that the methods under discussion will afford a workable remedy.

—The editors of *Scribner's* have chosen to give the mind of their readers a rest from

strenuous themes, with the exception of the few who care enough for "abroad" to be stirred to a strenuous mood by Mr. Millard's paper on the "New China," a paper which will doubtless gain a few readers from its writer's established reputation for "other-sidedness" in Eastern affairs. Francis Wilson opens the number with a reminiscent paper on "Joseph Jefferson at Work and Play," acompanied by an interesting group of photographic illustrations, in two of which ex-President Cleveland appears, naturally with fishing-rod in hand. Ernest Thompson Seton writes of the moose and his antlers, with a score or more of illustrations from his own and other collections. George Moore contributes reminiscences of the Impressionist painters, and the Field of Art gives a brief, though very favorable, account of the "Gallery of National Portraiture" assembled by the Pennsylvania Academy of Fine Arts last November.

—William O'Brien's 'Recollections' (Macmillan) are given to us in an attractiveiy printed volume of over five hundred pages. They are brought down no later than to 1882 and his return as member for Mallow. The portraits of Mr. Parnell, Mr. Butt, Archbishop Croke, and himself are excellent. The dedication, to "The Mother of My Wife," does credit to his heart. Mr. O'Brien wields a facile pen. Old Fenian days in Ireland are graphically and on the whole truthfully portrayed. The struggies of an Irish lad from indigence to eminence are affectingly told. His proposal of marriage at sixteen to a pretty actress is idyllic; and dramatic was their meeting twenty years afterwards in the House of Commons, of which he was then a prominent member, she having been twice married in the intervai. It would not be easy in literature to find a more pathetic incident than his vigil beside the remains of one brother, who had died of consumption, whilst in adjoining rooms a brother and a sister were in their last hours from the same feli disease. The book will be read with interest by all who have lived through those days and who are interested in Irish affairs. Mr. O'Brien is over-generous in his estimate of the characters of many of those with whom he has worked, and appears to have broken with others with whom through most of his career he was most closely connected. As material for history, the volume must be used with caution. The author is often carried away in his statements of fact by what he would wish to believe had been, rather than by what really was; and his recollection of events does not always accord with that of others who were as much behind the scenes and have had as good opportunity of judging as to the truth.

—Hjalmar Cassel, a Swedish engineer who visited this country during the St. Louis Exposition, has published his impressions in a slender volume entitled 'American Business Methods' (Stockholm: Bonnier). The central chapter in the book is the one in which he puts the question: "Is the superiority of American industry based on better machinery?" This, he thinks, is not the case, though he finds American tools and machines superior to those made in Europe; but American machines are sold all over Europe, and are used to as good advantage there as here, at times to better. "Nobody who inspected the Exposition with impartial eyes could there find evidence supporting the opinion that American industry is qualitatively superior to that of the Old World, and that it uses mechanical appliances which are foreign to us. I am inclined to think that many European engineers were to a certain extent disappointed in what they saw of American productions. They had expected to find here, as well as in American factories, clear reasons why the United States has become such a powerful factor in the world's markets. But what they saw was in general not new, and the new was not instructive. They returned home enriched with a few details, but with the riddle unsolved." The reason for the superiority lies, in the author's opinion, in the better organization of offices and factories, the methodical supervision of every detail, the constant watchfulness that no single branch of a business fall behind, and last, but not least, the minute division of labor. Mr. Cassel had his eyes open and his wits about him as he wandered through streets and factories, and he discusses with insight both industrial and social conditions, though his glasses are too rose-colored.

PAUL'S HISTORY OF ENGLAND.

A History of Modern England. By Herbert Paul. In Five Volumes. Vols. III. and IV. The Macmillan Company. 1905.

These additional volumes of Mr. Paul's history of the latter half of the nineteenth century show the same qualities, the same style, the same manner, as did the earlier. Mr. Paul has too marked an individuality to vary much from himself. Here he is again bright, rapid, epigrammatic, free from all vagueness or hesitation, delivering positive and definite views, telling his story in short sentences whose meaning no one can mistake. He is not a partisan in the sense of endeavoring to suppress the case for the side to which he does not belong while setting out the whole of his own. But he has strong opinions, and allows them to appear. No one will think the worse of him for that, especially as he shows himself capable of recognizing from time to time the merits of individual opponents and the faults of his own party leaders.

His treatment is perhaps rather too chronological. When we want to know exactly what happened and the order of time in which each thing happened, we go to the *Annual Register*, or to some such summary of events as one finds in the *Political Science Quarterly*. From a history written thirty or forty years after the events one expects a rather different way of treating those events. They may then be grouped according to their natural connection, each group being handled separately, so as to explain those among the causes and those among the consequences of some important event which did not appear palpably on the surface just before or just after it occurred. This advantage of writing about events sufficiently far away from them for them to have fallen into their true perspective is not quite sufficiently turned to account. Mr. Paul does, indeed, see which are the bigger things he has to deal with; but he does not always isolate them for the purpose of showing their magnitude, and so help us look at them all round as being the capital phenomena to be comprehended and estimated.

An instance may serve to illustrate what we mean. Volume III. begins with the death of Lord Palmerston in 1865. His departure marked the closing of one era and the opening of another. Lord Russell became Prime Minister. Mr. Gladstone became leader of the House of Commons. They brought in a bill for the extension of the Parliamentary franchise, and the democratization of Great Britain began. They were defeated in committee on the bill, and forthwith resigned, but the stone had been set rolling, and it has continued to go on rolling ever since. In 1867 Mr. Disraeli passed a Reform Act which lowered the suffrage in boroughs further than Mr. Gladstone's bill of 1866 had proposed to do. After some years, during which the discussion of the subject was frequently interrupted by exciting crises in foreign and colonial affairs, another Reform act was passed in 1884 which lowered the Parliamentary suffrage in counties, followed next year by a Redistribution act which swept away many small constituencies and the few pocket boroughs that had survived. Thus in eighteen years from the close of the Whig-Liberal period which began in 1832 and ended in 1867, Great Britain had been turned into a country thoroughly democratic so far as her political constitution was concerned, save and except the retention of an hereditary House of Peers. This is one of the most remarkable revolutions that any modern country has seen, although its magnitude was concealed partly by the gradual and peaceful nature of the process, partly by the preservation of all the ancient forms and usages of the Constitution, partly by the fact that the working classes, who since 1885 have been completely masters of the situation, did not for some time realize their new power, and made comparatively little use of it to demand legislation in their own interest.

Now the questions which the student of history puts to himself upon the point are these: What brought about this revolution? Why was it effected so quietly and peacefully? Why did the Reform acts pass with the concurrence of both the great historical British parties? In 1832 the Tory party fought (to use a popular expression) like devils against the Reform bill of that time, which transferred political power from the landowners and men of wealth generally to the middle classes. But in 1867 and 1884 neither the rich nor the middle classes resisted the transference of power from themselves to the laboring class. If they had been terrified by menaces and the prospect of revolt on the part of the laboring class, one could understand this easy acquiescence. But that class, as a whole, showed little passion, and not even much impatience, for an extension of the franchise. These are problems which strike one who, with American history or French history in his mind, comes to the study of modern England; and, so far as we know, no writer on modern England has yet set himself to explain them. Let us hope that, in the concluding volume of his present work, Mr. Paul will devote adequate space to their investigation.

Another singular feature of English politics during the last fifty years comes out

strikingly from such narratives as we have in Mr. Paul's book, and in that by Sir Spencer Walpole ('The History of Twenty-five Years'), which was noticed not long ago in these columns. It is the change in the attitude of public sentiment toward war on the one hand, and toward liberty on the other. It might have been expected—and contemporary observers did in fact expect—that the advent to power first of the middle classes and then of the working classes would increase the love of peace, and the disposition to concentrate attention upon domestic legislation calculated to benefit the classes forming the majority of the electorate. Mr. Cobden, for instance, and Mr. Bright, and Mr. Gladstone himself, all believed that as the danger of wars between nations would, if not extinguished, be at least immensely reduced by the general adoption of free trade, so the liking for war among the English would be reduced by the extension of the franchise to the class whence private soldiers are drawn, and by a diminution in the power of an aristocracy which had enjoyed war and found occupation in it. This has not, so far at least, proved to be the result. The Crimean war, which every one now admits to have been needless and foolish, was popular with the then dominant English middle class. There was an outburst of war feeling against Russia, equally foolish, in 1877, when the working class in the towns had been enfranchised, and another still more recent war, which nearly all foreign observers deem to have been quite as needless, and much more unfortunate than the Crimean war, was unquestionably popular, though, it would appear, rather less so among the workingmen than among the richer sort of people. How comes it that the wise men who knew their fellow-countrymen as Mr. Cobden and Mr. Bright did, have turned out to be in this matter so mistaken?

Then, again, every one supposed that a democracy would, by the very law of its being, sympathize with freedom and those who were struggling for freedom all over the world. Having just won their political rights, they wish others to do the same. But in point of fact there has been less of such sympathy displayed in England since 1885, when England became a democratic country, than there was in the days described by Mr. Paul and Sir Spencer Walpole, when Lord Palmerston figured as a popular hero because he upheld the cause of the Italian patriotic party. There have evidently been causes at work modifying the old sentiments and creating new sentiments which were undreamt of in 1840-70. The growth of what is called "Imperialism," not only in England but also in America, is a phenomenon lying deeper down than the political struggles of the moment, and it needs more analysis than it has yet received.

Mr. Paul, though he cites few foreign authorities on matters of international politics, not even Prince Bismarck's 'Reminiscences,' or General Sir Charles Wilson's account of his effort to save Gordon at Khartum, describes England's part in world affairs with spirit. He is, however, most fresh and telling when he deals with the parliamentary side of politics, as in his sketch of the debates on the Eastern Question crisis, which several times became acute in 1876, 1877, and 1878. Having himself sat in the House of Commons, he understands its ways, and relishes the incidents which enliven representative assemblies. He often happily hits off the characteristics of eminent men, though he gives no finished studies of character, such as the example of Livy and Tacitus used to prescribe to historians of the last generation. Yet Lord Palmerston, Mr. Disraeli, Mr. Bright, and Mr. Gladstone, to say nothing of persons of the rank next below, such as Sir G. C. Lewis, Mr. Forster, Sir Stafford Northcote, Lord Selborne, Lord Granville, are more than sufficiently interesting to deserve a careful analysis of their gifts and of the causes which won popularity for them. Nothing, indeed, is more curious, or better illustrates the complex character of the English people, than the fact that four men so extremely unlike one another as the four first named should have all at one time or another during their long careers acquired so much hold over large sections of their fellow-countrymen.

Mr. Paul enjoys passing literary judgments no less than he does depicting dramatic political situations, but many of these judgments will not command universal assent. To speak of Mr. Lecky as having "written philosophical works of much interest and power" seems to attribute to him what he did not possess, and rather to ignore what were his special and distinctive merits. To call Professor Clifford "the first metaphysician of his age" is a bold and sweeping statement, which metaphysicians generally will by no means accept; nor does the view that Professor Seeley, no doubt a most powerful writer and lecturer, was "equally gifted as a writer and a thinker," stand on any better foundation. Few philosophers, we suspect, and even fewer Greek scholars, will agree to the glowing eulogy bestowed on the translations from Plato of Professor Jowett, who has other and better titles to fame.

As respects accuracy in matters of fact, very few mistakes have attracted our notice, and these of small moment. The statement in the account of the Hyde Park troubles of 1866 that "the railings were torn down in several places and the Park was invaded by the rougher portion of the mob" (p. 53 of vol. i.), is at variance with the best contemporary accounts, which show that the crowd was not a mob, and the first fall of the railings half an accident, due to the fact that, being weak, they gave under the crowd's pressure. So (p. 59) it is hardly right to say that "neither Kelly nor Bovill would have been appointed on purely professional grounds." In describing the murder of Sergeant Brett (vol. i., p. 110) it ought to have been stated that Brett was killed by a shot fired at the keyhole of the police van in order to break the lock. Mr. Disraeli's influence with and over Queen Victoria is antedated when it is given as beginning in 1867 (vol. i., p. 127). It began after 1874, when he was Prime Minister for the second time. In dwelling on the advantages British shipping has derived from the Suez Canal, Mr. Paul has omitted to mention that its opening has seriously injured English ports as centres of distribution for Europe.

Space fails us to cite more than three of the happy turns of phrase which abound in the book. Commenting on Lord Chancellor Westbury's fall, Mr. Paul observes: "Either prudence or moral sense seems to be required for lasting success, even in so imperfect a society as this." Of Mr. Ayrton he says: "He was made Judge Advocate-General, who in those days was neither a general, nor an advocate, nor a judge"; and of Mr. Bright, who talked in a breezy, irresponsible way: "He seldom remembered that he was in office except when he resigned."

MR. RUSSELL STURGIS'S LATEST BOOK.

A Study of the Artist's Way of Working in the Various Handicrafts and Arts of Design. By Russell Sturgis, A.M., Ph.D. 2 vols. Dodd, Mead & Co. 1905.

Some twenty years ago an imperial commissioner was sent from Japan to inquire into the Western methods of teaching and practising art in every direction, as well as the forming and management of museums; and naturally, too, the things that are put into museums—paintings, and sculpture, architecture, etc., etc. The Commissioner had never seen the West nor its arts, and on his way to Europe he remained a short time in the United States. He was puzzled for answers to his many questions, on all possible points, including naturally the literature relating to art. He was advised, and rightly, to go to Mr. Russell Sturgis, whose information was encyclopædic, and who would direct him also to find, when he could not be answered at once. The present book of Mr. Sturgis recalls this all-sufficient anecdote. It is a form of notebook, but also of encyclopædia, and one more offshoot of a habit of life constantly curious in everything connected with art. Over forty years ago, Mr. Sturgis was already a collector, and especially a collector of Japanese art, which was only beginning to be recognized throughout the Western world. Many of the examples and explanations and definitions of his book are the records of a collector who remembers, or who actually has in his hands or before him, the object that serves as a lesson or an explanation.

The people of the time of our earlier interest in art, some fifty years ago, were held in certain currents, and were influenced or moved along them by the intellectual tendencies just preceding. The "unending" Mr. Herbert Spencer encouraged us to believe that we were learning everything, and that, as Mr. John Fiske used to say, we held the world now by the tail, and could swing it if necessary. The world itself helped us by becoming more and more known each day The encyclopædia, the sum of universal knowledge, was opened to us at length. We were still affected by the storm and stress of the energies of such minds as Mr. Carlyle and Mr. Ruskin, from which even now it is difficult to escape. In this very book we come across the wordings of those English influences—impossible statements, but accepted at that time as good rhetoric, and representing morally and intellectually that little point of the nineteenth century when everything was being settled. Hence, in this book, otherwise so practical, the Ruskinian forms of "unfailing care," "absolutely good," "absolute requirements," and so forth. One notes this with a feeling of the enormous distance between our phraseology of that past moment and the requirements of to-day, when relative truth is more frequently considered. But there was then in all that pertain-

ed to art a wave of enthusiasm which helped to carry one on. The necessary adjuncts—care and admiration for the Pre-Raphaelite school, especially as understood over here—marked some years of this interest in art, and here again in Mr. Sturgis's volume is at least one example of our American Pre-Raphaelites. But Mr. Sturgis at a very early day recognized the value of such contradictory work as that of Homer Martin and Winslow Homer, nor has he ever varied in his appreciation of these two important characters in American art. Always, whatever his views and studies may have been, Mr. Sturgis's walls have received works of drawing or painting which he has not heen ohliged to change. It is therefore with much right to speak as an expert that Mr. Sturgis has made this very large hand-book of certain parts of his experience. Moreover (as he says in his preface) his experience, that of an architect engaged in decorative work, has given him a lifetime of familiarity with fine arts in nearly all their forms, and in most cases a knowledge also of the processes employed—a familiarity gained in watching the work going on, if not in practising it.

The various methods through which the artist works, he has tried to connect, so that, for example, certain methods of painting are explained to a great extent hy his description of the methods of sculpture, and hoth, too, again, hy his consideration of design as evidenced in architecture, which is, of course, the fundamental basis of work in sculpture and painting, and, in fact, in every manner of the hands expressing such intention. Mr. Sturgis has been careful to keep hefore us the relation of what we may respectively call "practical" and "expressive" in these arts—for example, the actual use of paint, or what he denominates "flat" painting, as connected with the representative painting of more important art.

Of course, Mr. Sturgis can give hut the merest glance at these matters. Any detail would become so enormous that a whole library would he necessary to explain more fully. For instance, even in "plain" painting, as we call it, the mere variety of preparation of the whites used in domestic architecture, in the eighteenth century, would fill a vast space. And, indeed, there used to be a hook as large as Mr. Sturgis's volumes describing nothing hut these tones of white and gray used in polite huildings of the eighteenth century. As Mr. Sturgis points out, to-day we do not go into such refinement, and the tone of the wall is near enough if there he no legal redress against it. It is difficult to have an architect, or even a painter, believe that there is a great difference hetween one tone and another of the same color, in decoration. One can fancy what architects of the eighteenth century would feel if they for an instant could see the whites and grays used in our modern millionaires' residences. Their wigs or their powdered hair would rise in astonishment at the commercial treatment of these delicacies of common art. This mere mention shows how almost impossihle it is to gather together descriptions of methods in any one art, especially in the almost infinite art of painting, within the limits of an ordinary hook. Nor are the explanations of artists, as given to the inquirer, always of much use. One frequently finds that an excellent practitioner of, let us say, painting knows nothing of the ninety-nine-hundredths remaining of the practice of painting. This is so frequent that one can be sure that such a case must have happened yesterday or the day hefore; that is to say, that some painter of considerable quality shall not know how the men of the eighteenth century, or the seventeenth, or sixteenth, or fifteenth, or fourteenth, or thirteenth, painted, nor how the great men painted—neither their preparations, nor their methods, nor their habits. All of which is perfectly natural, and, we think, is well referred to by Mr. Sturgis. But then, as those methods, in the minimum of present records, fill whole volumes, it will he seen how impossihle it is to begin to describe them in sequence in the course of the few pages of an ordinary book. Their principles might be laid down, but Mr. Sturgis has not undertaken to do it, they being, perhaps, hehind the facts rather than on top of them. Thus, the entire modern inquiry concerning painting, from the neighborhood of 1850, is not referred to by Mr. Sturgis, and perhaps wisely, as introducing a scientific and fundamental view which, as we have said, would rather underlie the inquiry than be evident in it. Of course, we all know that the inquiries into light and color have been one of the special points of the last sixty years, and that almost all painting has felt the result, and that a great deal of painting has hcen based upon it.

Mr. Sturgis, then, by putting aside these very fundamental points, gains the advantage of merely describing certain outside facts in the practice of the art, and these he again narrows by describing only two methods, which he follows out in a description of two paintings. These he takes apart in very ahundant detail, to show the actual mechanism of two different methods, exemplifying, let us say, water-color work and painting in oil, and then he gives no more examples. Of course he cannot give even a few important manners of work without increasing the size of his book to something enormous. Painting, using for its method of addressing us the whole of the world that can be seen or imagined, is practically infinite. Innumerable are the variations which the future may introduce, as innumerahle are the objects which the eye may notice, and these again are varied infinitely by every consideration of light and air and position, apart from the more hidden intentions of sacrificing or exaggerating to keep to the path chosen. With the artist who knows, no landscape painted is as true or as full of meaning as tho landscapes which still remain to be represented. What has been done is satisfactory, because it is a part of this enormous country of choice. However wonderful the works of each one of the great masters, they are each deficient in something that another gives, and it is we who make the reality of what we see in them.

Mr. Sturgis has thought fit to place at the end of his volumes, rather than at the heginning, principles or notions regarding the artistic side of architecture. But he has hegun his notices, his divisions, with one of the most valuable of all statements, and one which comes in very well at this very beginning, where he purposely analyzes some work of South Sea Islanders, who by most persons are considered as "primitive." He states that in his book "decorative art" will not be separated from other Fine Arts. Therein he has taken a position which is the proper one at the present moment when we are rather painfully escaping from the classifications of the last century. Nothing in the French Government management of Art seemed more ridiculous and impossihle to the Japanese commissioner of whom we spoke a moment ago, than the existence of a special department for decoration, or painting with a decorative intent. This seemed to him (as it would to all remaining in the great path of the ancient ways) a curious error, had in its effect, destructive of the reflex influences of the workman, certain to encourage the meaner sort, and thereby to keep the more important artists from an intimate relation with decoration, such as they have always had in the great past. But the French idea, which threatens us, perhaps, at this moment in our teaching, is not peculiar to France, and has had a remarkable influence on all the art of the nineteenth century. As already noted, the art of painting has had new directions forced upon it through the studies of nature made by scientists, and through a natural confusion of the intentions of painting, the realities seen being treated as the object of the painter, and not his means—that is to say, roughly, through the prevalence of a form of realism. Perhaps, in opposition, the so-called "ideal" of the school has its origin in the division we consider. That is why the result of the separation of the decorative and representative sides has been a number of foolish recipes in representative painting for what is called composition, *i. e.*, arrangement. This principle of all art has been represented hy a few common-school formulæ, while, of course, the variations must he as numerous as the possible combinations of geometry. Mr. Sturgis will remember how a distinguished foreign decorator, lecturing to the Architectural League, assured them that Japanese decoration or painting was pure haphazard—unlike his own three or four recipes. But a fairly large proportion of British criticism has to be looked upon as the subject of pure amusement, such as Mr. Whistler delighted in.

To return to our explanation: The decorative side of art, which is nearer to fundamental principles and heginnings, was therefore forcibly separated from that side of painting which represented stories, or, again, which aimed at copying the aspect of nature. More and more the artist—meaning thereby the real artist—was separated from the artisan. Instead of lifting the artist, this degraded him, as happens to all parvenus, and he sought to make his pictures by recalling stories or subjects or intentions, instead of carrying them out by their physical qualities of art. The result has heen the increase of the commercial influence in art. In England the fact has stamped an impress of snobbishness upon almost all British art, and all the more in the corners and places which were believed to have escaped it. The exclusiveness of the refinement of some years back had its blossom in the forms of art with which we might associate certain names—for instance, that of Morris. All the genius of Rossetti could barely emerge from it. Burne-Jones complained

that his own stained glass became commercial, but he could not see why, being immersed in the same waters. And if his art was impressed by it, what could we expect from others? Burne-Jones had painted outside of his glass, and was a master apart from this. The inferiority of work in this form of decoration, as in most others, is the inferior capacity and experience of the decorators outside of what they do. Since the separation spoken of, no great artist has devoted time to these arts except in the superficial way just explained. The result is necessarily middle-class art, the art of the house-decorator, the ecclesiastical art furnisher. When the decorator can challenge the artist in any other line, he has a right to lead, not before. Mr. Sturgis refers many times to such points—there being no objection to the commercial, or a certain part of it; it is only the misplacement that confuses. The work of art, of course, cannot be duplicated, or done in batches, and this definition helps. We have heard that the Oriental judges have criteria for dividing works of art into the real (original) and the imitation—as our ladies have for lace. We can remember how our Imperial commissioner, on his first sight of European paintings, so divided them with incredible rapidity. We remember how he said at once, on looking at what seemed to us merely very good work, "Oh, this man is one of a set."

Lessons in this direction Mr. Sturgis intends to give all through his book. If they be not all evident, it is to be attributed to the main difficulty of our educational work—that of addressing a multitude so as to include the "lower forms." In the teaching of the Fine Arts this has become the great obstruction. In the art of writing we still hold to high or fine examples. Thus, even if good of their kind, no school or college would use advertisements as models of literature. Our authors' models are almost always of the highest class. And, as the Master said, "Make your acquaintances of your superiors; if that be not possible, then consort with equals, but never with inferiors—because we are the result of what we touch."

TWO GREAT GAZETTEERS.

Lippincott's New Gazetteer: A Complete Pronouncing Gazetteer or Geographical Dictionary of the World, etc., etc. Edited by Angelo Heilprin and Louis Heilprin. Philadelphia: J. B. Lippincott Co. [1905], 1906. 8vo, pp. x., 2,053.

Ritter's Geographisch-Statistisches Lexikon: Neunte vollständig umgearbeitete, sehr vermehrte und verbesserte Auflage, unter der Redaktion von Johannes Penzler. Erster Band, A-K. Leipzig: Otto Wigand; New York: Lemcke & Buechner. 1905. 8vo, pp. 1,248.

A spirit of benevolence as well as sense of incompetence may fitly possess the reviewer of a new edition of a world-gazetteer. Lippincott's has long held a more than respectable position in its class, but the revision of 1880 was but patched up in 1893, and the difficult task of a fresh revision had finally to be faced. The Messrs. Heilprin were almost the foreordained directors of it. Sons of a cyclopædic scholar, the late Michael Heilprin, strong especially in historical and geographical knowledge, and reared amid the making of cyclopædias, in which they shared their parent's labors, these brothers have impressed their mark in both fields: the one, an extensive traveller and explorer from Alaska and Greenland to Mexico and the West Indies, a geologist, a naturalist who has written authoritatively on the subject of the distribution of animal life on the globe; the other, author of a paragon of an 'Historical Reference Book,' in which geography, history, and biography are reliably interwoven. Their collaboration insured for their own direct contributions the highest degree of accuracy, proportion and consistency. For what they let stand of the original work, they could hardly escape being secondarily responsible for some portion of errors or omissions.

The adherence to one volume is presumably to be charged to the publishers. Why, it may be asked, should not Lippincott's conform not only to the fashion of most cyclopædias and the major dictionaries, but of other gazetteers, like its German contemporary above cited? The reply may be that the single-volume condition really assisted the editors in the exercise of a severe self-restraint. The new edition is actually compressed, in spite of all additions, into 2,053 pages as against the 2,478 of the issue of 1880. The preface offers a capital summary of the changes effected, in the editorial aim to avoid "artificial standards" and the "weight of dead matter"—such as the obsolete tables of trade statistics excised from the notice of New York city, which has been reduced from three and a half pages to two and three-quarters. The article on Boston, rewritten *con amore*, has shrunken one-fifth; that on Philadelphia, one-third. Such gains permit the expansion of "Japan" by doubling, and of "Russia" by nearly one-half; and where the bulk remains the same, as in the case of the United States, room is made for such handy tables as the "Landmarks" in our history, with special reference to territorial development, and the chronology of the admission of States. Two minor examples of the trained judgment in reëditing may be cited, viz., Northampton, Mass., and the account of Chicago's great fire; nothing essential has been discarded, but the blue pencil has been at work. Sometimes, no doubt, the pencil works too automatically, as when the adjective is stricken out of the "*former* residence of Washington Irving" (under Irvington), as if he might be his own Rip Van Winkle.

The wonder is that in so huge a work the text throughout should be corrected or enlarged so close upon the date of publication, of which an easy test is the signing of the Treaty of Portsmouth, September 5, 1905—an event punctiliously commemorated under Japan, Portsmouth, and Russia. In petty matters, apart from the census returns, this was impossible. How know (or care!) that West Bethlehem, Pa., ceased to be a borough in 1904? But, under Bethlehem, Pa., the institutions of that historic town deserved more specific mention, particularly the girls' school, of changed name but long and honorable record; and why, by the way, the superfluous "*Christian* sect of the Moravians"? Under Cambridge, Mass., one might have expected to find mentioned among the more prominent buildings at least the Harvard Union and the Stadium, if not the Nelson Robinson, jr., [Architecture] Hall and the Phillips Brooks House. So, under Newark, N. J., the Prudential's building, one of the most successful, imposing, and ornamental structures among all the sky-scrapers of the New York metropolitan district, shines by its absence, and by the mention of a rival company's much inferior domicile. For such details a remedy could be found only by a very large sub-editorial organization, through which every American article might be submitted to local experts, just as 'Who's Who,' in renewing itself, sends out to every person recorded the previous statement for revision or addition.

Foreign topics are, of course, considered on a different scale, though Italian towns especially, down to the smallest, appear in numbers. Here the picturesque and historic element has appealed to cultured editors. They claim, and justly, that historical notices in a gazetteer must refer "largely" to changes of boundary, "vicissitudes of foreign domination," additions and subtractions by conquest, and the like. Largely, but not exclusively, unless a gazetteer is to be a mere commercial dictionary, occupied solely with numbers, whether of tons and dollars, or of living inhabitants. A touch of the past enlivens statistics of the present; and happily the historian has been allowed, within limits of reason, to mitigate the geographer's details. Many places once of note have here as elsewhere been lost to memory, at least under their old names; but it is gratifying to find the long and tangled lines of the counts of Mansfeld and Stolberg recalled, though in fewest words, in connection with the villages once the centres of their rule. The notice of Wismar ends: "It was in the possession of Sweden from 1648 to 1803." Space might have been spared to add that it was then mortgaged to the Duke of Mecklenburg-Schwerin as security for a million crowns borrowed by Gustavus IV. The interest accumulated till the debt was past paying, and in September, 1903, it was discharged by transference of the town. The historical section of the article "France" has been entirely rewritten, with an avoidance of bias or moralizing, and any one who compares it with the corresponding column in the edition of 1880 will receive a lesson in the art of lexicography.

Some divergences in past and present editing may be remarked. The practice, more or less thorough, of subjoining the name of the inhabitants of a given place or country, *e. g.*, Aragonese, Viennese, Florentine, Marseillais, Palermitan, Neapolitan, Madrilenian, etc., has been dropped. This we rather regret, though the space saved would have been more significant if the old practice had been thorough. More than twice as many initial Tch's occur in the alphabetic sequence as formerly, but Chinese names, like Chi-fu, are not tampered with; and, though we have Kamtchatka, the form Manchuria remains. This transliteration is reserved for Russian, Turkish and other West Asiatic names. The French diphthong *ou* is discarded in Abukir, Rumania, Rumelia, Seul, etc., and the *oo* of the earlier edition in Baku, Timbuktu (alternative Timbuctoo), etc. Dawson City, Johannesburg, Kimberley, Klondike, Oklahoma (one and a half columns), are brand-new titles. The Philippines are as good as new. For Ma-

nila, by the way, the alternative spelling Manilla is no longer recorded, though it represents the English pronunciation as "manee-la" does not. New, too, is Australia (the Commonwealth), with its brief outline of the Constitution of the Federation; and this observation on its antipodal neighbor (p. 1303): "In no other country of the world has state socialism and the participation of government in matters affecting labor and capital advanced with such strides as in New Zealand."

The new Ritter makes its appearance not a quarter century but a decade after its last edition, still under the direction of Johannes Penzler, and giving every evidence of an organized "institution." Its form and typography are preserved, but the 1,064 pages of this moiety in the eighth edition have become 1,248 in the ninth, notwithstanding a rigid elimination of matter deemed irrelevant to the main objects—to subserve industry and commerce in particular. Hence history cuts no figure whatever, and Japan, for all her recent military and political strenuosity, has no more space granted her than ten years ago, and her agriculture, fisheries, manufactures, and constitution in peace overshadow, for Ritter, her armaments afloat and ashore. Barely do we get two lines at the end predicting great changes in many respects as a result of peace with Russia; of the war itself otherwise not a word.

The inclusiveness of this Lexikon is naturally greatest for domestic use, and every place in Germany of 100 inhabitants and upwards is recorded. The scale then lowers to 150 for Austria and Switzerland, 200 to 500 for outstanding Europe, 500 to 1,000 for the remainder of the globe; but post-offices, telegraph and railroad stations, baths, and factories are liberally embraced irrespective of population. For example, the post hamlet Darkey Flats in Queensland, Australia, obtains bald mention (though Darkey Springs, Tenn., admissible by the same title, was too new or too invisible to be seized for the present edition). On the statistical side, the editor claims official information comparable in directness to that for which the 'Almanach de Gotha' annually makes its bow.

In point of fulness we have compared the American and the German dictionaries by counting a tract taken at random—Bushey-Buttel, just two pages of the latter, a little more of the former, with the resultant figures, excluding cross-references, of 112 places for Lippincott—reckoning in, however, the rubric *Bushmen*, not admissible to Ritter—and 310 for Ritter. Of these, making allowance for rough counting, the number of American names is the same in both volumes. Equally at random, as manifesting difference of methods, we subjoin two minor articles:

(Lippincott) "*Cholet* [pronunciation indicated, a cardinal feature of this work], a town of France, in Maine-et-Loire, on the Maine, 37 miles S. W. of Angers. It is the centre of a great textile manufacturing district. It figured in the wars of the Vendée. Pop. in 1901, 17,150."

This is fairly readable. Here is

(Ritter) "*Cholet*, 1) Arr. in Frankr., Dep. Maine-et-Loire . . . . 3) Hptst. [capital] ebd., 19,352 E. (Population), P. T. [Post, Telegraph]. EdL [R. R. station] La Possonnière — Niort, Ch. — Clisson, Saumur—Ch. u. Nantes—Ch. [sundry lines]. Battist-, Leinen-, Calicots- u. Flanellweberei [textiles enumerated]."

This juxtaposition, with what has gone before, teaches that any one who can afford it must secure *both* these admirable works.

A Memoir of James Jackson, M.D. With Sketches of his Father and Mother, and Some Account of his Ancestry. By James Jackson Putnam, M.D. Boston: Houghton, Mifflin & Co. 1905. Pp. xii., 456.

The author of this work, a grandson of its subject, is heir not only of his blood, but of his professional acquirements and devotion. His work is a labor of love, and as such it must be viewed. Not that it need fear any criticism from outsiders, but only those can truly appreciate it who were to some degree within the charmed circle of Dr. Jackson's presence.

The first half of the book traces the line of the family from the earliest emigrants from England, sons of Christopher Jackson, and treats of various members of it, more especially Jonathan Jackson, an ardent and enterprising patriot of the Revolution, active in the Continental Congress and in the Federal party early in the nineteenth century. It tells the fortunes of his four sons, Dr. James Jackson's brothers, two of whom were shipmasters, one (Charles) prominent on the Supreme Bench of Massachusetts, and one (Patrick Tracy) a pioneer in the textile manufactures of Massachusetts. The father and all his sons made the strongest impression on their community for their intense activity of mind, their sterling probity, and their social charm. For many years they were associated with Newburyport, and later identified with Boston. The group of congenial families with which they were connected—Cabots, Lowells, Higginsons, and others—furnished much of the very lifeblood of Boston in the first half of the century just closed: κ'οὔπω σφιν ἐξίτηλον αἷμα δαιμόνων This memorial is very valuable.

The second part is the memoir of Dr. James Jackson. This admirable man was born in 1777. He graduated from Harvard College in 1796; studied medicine with the venerable Dr. Holyoke; went to London in 1799 to "walk the hospitals," returning in 1800, when he immediately began practice. He was soon appointed professor in Harvard College; was instrumental in the successive foundation of various medical societies; was very active in the introduction of vaccination, and one of the founders of the Boston Medical School and the Massachusetts General Hospital, remaining in active practice for almost his entire life, not finally retiring till shortly before his death, which occurred in 1867. This is not what would be called an eventful or exceptional life; it is marked by no striking discoveries, nor, after the earliest years of practice, by professional controversies. Yet Dr. Jackson was a marked man, who made a profound impression upon his contemporaries, old and young, and the traditions of his temper, his character, and his wisdom will never die among Boston physicians. This he effected by a rare combination of qualities, preëminent among which was what one of his most intimate friends calls the "union of caution with boldness." He was never rash, and he was never timid. Having in his youth exerted himself with more than youthful energy to bring American medicine in line with the best science of the day, having shown by precept and example how much might be done to correct the excesses and errors of earlier practitioners, he was naturally conservative as he grew older. Yet his conservatism had no bigotry in it; it was simply the conviction of a vigorous mind that the old art had not yet been exhausted. His science and his experience were alike under the control of the most remarkable common sense—not that form of it which sometimes enables a comparatively untaught or inexperienced practitioner to atone for his deficiencies, but a controlling, imperial common sense, which saw into the very heart of the case, both for diagnosis and treatment, bringing to bear every circumstance with a penetration like Sherlock Holmes's. In the life of Prescott the historian it is recorded how Dr. Jackson, then a young physician, detected the signs of rheumatism where older physicians saw nothing of the kind, and the suspicion was in the end fully verified. A striking light is thrown on his philosophy of medicine by the comparison made between Andral and Louis in a letter to his son:

"I do not doubt that the former is the greater man—the latter would seem to be a statician or statistician. Though statistics are very valuable, yet we always find that a man who placed (*sic*) great reliance on them, in any branch of science, physical, moral, or political, is apt to make the mistake of thinking that two and two always make four—which they do not. That is, he applies mathematical reasoning to subjects which do not admit it."

It is hardly possible to overestimate the wisdom of this sentence.

No quality made its way more irresistibly into the very souls of all Dr. Jackson's associates than the attraction of his manner. It was not the fascination of a courtier, nor the artless charm of a child; it was an outgrowth of the deeply-rooted self-respect of a Christian, which obeys to the letter the precept, "Honor all men." How truly Dr. Jackson completed the commandment and loved the brotherhood, the letters in this volume abundantly show. It was above all in the sick room that his empire over man and nature—for this phrase, exaggerated as it seems, is none too strong—was most manifest. In copying Dr. Putnam's words, the writer of this review is only giving his own immediate personal reminiscences:

"In the sick room he became supreme, and certain it is that few physicians have ever brought to their task a keener instinct for the important points of the case, a finer sensitiveness for the needs of the patient, a more complete devotion to the art of enlisting sympathy, authority, and unconquerable hopefulness, of utilizing the sound of the voice and the expression of the face in the service of therapeutics. In the presence of his searching love of truth, his firmness, simplicity, earnestness, and directness, prevarication and petulance were disarmed, and the best instincts of nurse and patient alike were made to do willing duty."

There were physicians of Dr. Jackson's time whom the very thought of having in the house almost kept one well, from terror; the thought that he was to be sent for, almost made it a pleasure to be sick.

The last part of Dr. Putnam's memoir is chiefly given to correspondence with inti-

mate friends. These letters, though very precious to those within the inner circle, do not always make the successive steps in Dr. Jackson's later life as clear as might be desired to those outside. But one sad event comes forth in gloomy, yet the richest colors. Dr. Jackson's hopes were centred in his oldest son and namesake, who, after a brilliant career as a medical student in Paris, returned to take up the practice of his father's profession, but was carried off, in the year 1833, when less than twenty-four years old. The blow would have been crushing to a temper less firm than the father's; but the loss was not his alone. There is the most authoritative testimony, lasting down to the immediate present, that the death of this young man removed one who promised to be, both by his attainments and influence, the pioneer of a new era for American medicine. Dr. Jackson's circumstances obliged him to keep in active practice longer than his constitution and age seemed to sanction; he finally retired not many years before his death, which occurred on August 17, 1867.

Dr. Putnam's memoir is prepared with great good taste and modesty. The placing of a general estimate of its subject's character before instead of after the story of his life, is an interesting and perhaps a wise innovation. There is very little to provoke criticism. One singularly constructed sentence occurs on page 227, as to the acceptance of Jenner's discovery; and the compositor has gone astray in several proper names. Sewell for Sewall (p. 105), Stevenson for Stephenson (p. 146), *George* McNeil Whistler (p. 148), Abbot for Abbott (p. 161), Corea for Correa (pp. 253-4), Haywood for Hayward (p. 290), Eliot (Cabot) for Elliot (p. 398), and Chauncey for Chauncy (p. 398; elsewhere correct), are noticeable. Prof. John Gorham appears as John W. (p. 285) and John C. (p. 425). But such things are trifles. The book is a worthy memorial of one for whom the present writer may be allowed to borrow Ben Jonson's words: "I did love the man, and do honor his memory on this side idolatry."

With the Empress Dowager. By Katharine A. Carl. The Century Co. 1905.

Miss Carl must settle with her own conscience, even as she attempts in her introduction to vindicate to the public, the apparent violation of hospitality and confidence reposed in a guest who obtained access to the privacy of the Chinese Empress. Apart from this question in ethics, with which the purely literary reviewer has in strictness nothing to do, her book is a document of high value. It gives much detailed information of the sort which may satisfy the lover of gossip relating to forbidden interiors and to more or less shrouded personalities, but it does more: it offers not a little to the student of Korean and Japanese origins, and of those countries to which China was not only the Middle, but the model, kingdom; her court being "the glass of fashion and the mould of form."

To a scholar like the late Dean Stanley, the Pope as the representative of antique Christian customs was "a perfect museum of ecclesiastical curiosities." So also the occupant of China's throne explains in her or his dress many things odd and strange in the costume, only recently discarded, of the Mikado of Japan and the King of Korea. Incidentally, one may understand the native dislike of and even irritation at the use of the term "Mikado," instead of that generic term which is given to the Kaiser and Czar. Those who, remembering the Emperor of Dai Nippon in the days of his flowing robes and black cap with heaven-pointing gold "feather," recall his brightly colored clogs, or shoes, which raised him four or five inches above the earth, will read with interest Miss Carl's account of "six-inch-high stilt-like soles" which lift empress and princesses above ordinary mortals. To this day, whether visiting a horse race at Yokohama or riding through the streets of Tokio, the imperial Japanese inheritor of Chinese notions will not be looked upon from above by any mortal. The top seats of the grand stand must be vacated, and the second and third-story windows closed. Other items and details in Miss Carl's book show whence the chief rulers of the pupil nations around the Middle Kingdom derived their copy-book. The strata of costume and coiffure still surviving in the "related" or vassal states are indications, both chronological and otherwise, of early and extensive borrowings from the great model.

Miss Carl, however, is wise. Her book is all the more valuable because she does not transfer to her pages opinions or information borrowed from the writings of Sinologues, but gives her own impressions all the way through. The Empress Dowager is usually represented as an ogress to and by foreigners, and her reputed capacity for devouring Englishmen and other Europeans excels even the desire and ability of that blood-smelling gentleman of nursery lore who used to chant "Fee- fo fum." Miss Carl's estimate of the character and womanhood of the chief lady of China is wholly different. Making all critical discount of the American's praise and appreciation, one can see here a genuine woman, who, besides being filled with a patriot's anxiety for her country and people, has shown uncommon ability. Having the old common-sense of the race, she was by her ministers declared a safer guide than the young palace-hermit who sat on the throne. She was called from her retirement when the Emperor became the tool of "reformers" who had other ideas in view than the good of China. Miss Carl's word-pictures of the Emperor and the princesses, besides being very interesting, throw much light upon the routine of life in the Forbidden City. While picturing on her pages the things delightful, she does not hesitate to show the uncanny aspects of Chinese life, even at court.

To the artist, the Empress was "the very embodiment of the Eternal Feminine. She was at once a child and a woman with strong virile qualities." After business with the statesmen, in the audience hall, transacting weighty affairs of state for three hours, she took a childish interest in the simplest pleasures, in flowers, dresses, and jewels. The festivities of the Court, the walks in the garden, the delights on the water, the palace customs, the summer and the winter days are pleasantly described. Yet the artist says little about the technique of her art, and why she painted so flat the picture which we saw at the St. Louis Exposition. Was it to please the lady who preferred the Chinese style? We outsiders cannot tell how much Miss Carl flattered the rather handsome and youngish-looking lady of well-nigh three-score years and ten, whose general dress and mode of wearing her hair, as well as face and features, are not violently different from those of European ladies. One must except always the (conventionalized) Chinese characters and the long nails of an adult lifetime's growth, to which we fear the taste of the Occident will never be reconciled.

Incidentally, the volume, which cannot boast of any special literary attractions, is a tremendous testimony to the power of peace-loving China to absorb into her social system such rude barbaric conquerors as rushed out of Mongolia and Mantchuria, and to make of these "horsey" militarists not only improvable races, but ultimately people that are hardly distinguishable from Chinese—a noble record. The book is worthy of what it has not, an index.

English Furniture. By Frederick S. Robinson. (The Connoisseur's Library.) London: Methuen & Co.; New York: G. P. Putnam's Sons. 1905. Pp. xl, 364. 160 illustrations.

This is one more of that very curious and interesting library of decorative art which is taking shape, and of which we have reviewed in these columns the volume on Ivories and that on Porcelain, by Alfred Maskell and Edward Dillon respectively. They are well-made books, and the charm of their "hand-made" paper, uncropped edges, and binding which allows of throwing open the volume, and which, on the whole, is comely, is a great help to the study of a subject that has everything to do with tasteful treatment and a generally attractive result. It is noticeable, however, that in the new volume, and apparently with the purpose of making the thick mass of text more perfect in its stitching, more flexible in the back, more easy to flip over with the thumb to find your place, the plates have been brought together at the close of the volume. The consequence is that, as we read, we are constantly referred to something we need to study, as to "another Lancashire chair, number 248 (Plate lviii.), with extremely similar top rail"; and that, with this, we are sent hunting through eighty leaves, each bearing a "plate" on either side numbered in rather small italic letters at the bottom. Then, as some of the plates are upright and others are oblong, the reader has to slew the book about from left to right and from right to left, that he may find and read those Roman numerals. Our reader may imagine the embarrassment and annoyance of all this, if he is really trying to follow the author in his careful exposition. The book would bear a higher price per copy if the plates all faced the same way, or if they were numbered at the top and in a uniform part of the page, or again if they were interspersed in the text as in the other volumes which we have examined belonging to this series.

Now as to the substance of the book. It is announced in the preface as expressly intended for the collector, and the very sensible remark is made that "a false idea of English furniture would be formed if a majority of the objects reproduced were such as are seldom or never found for

sale." On the other hand, the author has not hesitated to go to the Victoria and Albert Museum (viz., the South Kensington Museum, as Americans still know it best). Reproductions of Chippendale, Sheraton, and Heppelwhite books of examples have not been given, and that also is well. And indeed the pictures, all gelatine prints or such photo-process plates as may be approximately described by that name, are extremely attractive. One is gratified by finding so many unfamiliar types—cabinets, tall-boys, and settees, which represent the work of designers less often represented in our collections. A collection of 160 plates, containing at least twice that number of pieces of furniture, is worth anybody's while.

Of the twenty-five chapters, only one, seventeen pages long, is devoted to the whole mediæval period, except that chapter iii. deals with the "Early Oak Chests." It seems strange, but probably there is, of "furniture" properly so called, almost none in England of the period of Gothic architecture, or of the period which preceded that. Church furniture of the fixed and permanent sort, pulpits, and altar-screens, there is of course, and a very few examples of it are given; but it is evident that this is not the subject of the book we are considering. From the sixteenth century on, the theme is easy to pursue, for there is material for every decade of those four centuries. The list of illustrations which follows the contents is thirty pages long, and is a really valuable table of reference, giving, as it does, the dimensions of many of the pieces, and always the names of their owners, or the name of the church or museum in which each is preserved.

So much premised, it may be stated as a general truth that the book is written throughout with a strong personal character impressed upon it, as being the work of one who has collected or at least studied and gathered material on his own account. The reader gets to like the way in which uncertainty is expressed, for it argues knowledge when the limitations of that knowledge are sagaciously pointed out. As a correlative of this, the suppositions which are given as being suppositions and nothing else, are full of intelligence, and indeed the investigator who has not the power of conjecture at the right time will fail to arrive at interesting results. Have we not all read Tyndall on the use of the imagination in science? And is not the imagination, scientifically directed, of extreme importance in historical research? The only limitation which is required is instructed common sense. And so, as here is a large volume made up of minute items of discovery and of critical remark, it will be necessary to leave the reader with the assurance that he can hardly have a more sensible book on old furniture.

Military Studies. By Frederic Louis Huidekoper. Kansas City: Hudson Kimberly Co.

The author is on the whole justified in reprinting these studies, which appeared originally in military reviews. He would have been better advised, however, had he not included the one on Grouchy's operations in the Waterloo campaign, for its conclusions are at complete variance with present opinion, and he makes no reference to the best recent studies in France, England, and Germany, those of Houssaye, Kelly, Von Lettow Vorbeck and Pflugk-Harttung. It is entirely out of date to discuss Grouchy's disobedience of orders when it is well ascertained that, on the morning of Waterloo, Napoleon wrote approving his march on Wavre, and that only at 1:30 P. M., when the Prussian columns were already in sight, a dispatch was sent urging him to move by his left flank; that dispatch did not reach him until about 5:30. Grouchy's generalship was certainly far from brilliant; that of Napoleon was not, however, impeccable.

In his other studies, chiefly of the operations of Napoleon, Von Moltke, and Frederick, Mr. Huidekoper appears to better advantage. He is evidently a keen student of this extremely difficult branch of historical work, and deserves encouragement. There are, however, occasional inaccuracies; thus, in the essay in which he deals with Marsla-Tour, Vionville, and Jena, the following corrections of detail are necessary: at page 56 for Verdun read Werden; at page 59 it is said that from the Würzburg-Nuremberg line Napoleon could have marched against the Prussians via Mainz and Wesel; assuredly, but he could also at that rate have marched through Antwerp and Hamburg; at page 64 the French word *avis*, in an order of Berthier, is translated *advice;* it should be *information*—a very important difference in a military order.

On larger questions, especially of strategy, the author often fails to carry conviction; but, after all, strategy is always a process of disagreements, from the initial one of the opposing generals to the never final one of contending historians. Yet a clear consensus of opinion is against Mr. Huidekoper in such dicta as the following: "No one has yet succeeded in refuting the maxim that the fundamental principles of strategy always have been and always will be immutable"; or again, when he declares: "The immutable principles which must be observed are (1) to keep one's forces united, (2) not to be vulnerable on any point. . . ." It is just this attitude towards strategy that the greatest masters—theorists like Clausewitz and Henderson, practicians like Lee and Jackson—have rejected. If rules were immutable, war would not be a game of chance; if strategy did not depend on a fluctuating factor, which is the mind and courage of an opponent, Lee could not have shown strategy at the Second Manassas and Chancellorsville, but only fortunate ineptitude. "Strategical principles," says Henderson, "are neither to be rigidly applied nor overscrupulously respected; they are to be obeyed rather in the spirit than in the letter." Further work from Mr. Huidekoper in the same field may be looked forward to with interest.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 15, 1906.

The Week.

The word "levity" which Senator Dolliver applied on Friday to the attitude of the other members of the Interstate Commerce Committee toward rate legislation, is an odd characterization for a group of men who average fifty-eight years of age, and have served an average of nine years apiece in the most dignified body in the world. The particular Senator to whom the reproach was uttered, Mr. Aldrich, outranks all the rest of the committee, and has served more than four times as long as his Western critic. But be that as it may, the incident at least shows the potency of this legislation in stirring up ill-feeling. The committee discussion probably foreshadows on a small scale what will happen later on the floor of the Senate. When we have such a chance for a prophecy according to the simple rule of three, there is an irresistible temptation to make it. The committee intended to report a bill ten days after the session began. That would have been December 14. The date now set for the report—nobody knows what the bill will be—is February 16. Thus it took seven and seven-tenths times as long as any one expected for the committee to settle the bill. We have heard some talk of a month's debate in open Senate. If that represents the present expectations, then a vote may actually be looked for on or about the twenty-second day of September. Mr. Williams said that the House Democrats were willing to wait till Christmas, if necessary, for the Senate to do something. They may have to.

If the set speeches in the House on the railway bill were perfunctory, the running debates, and especially the offering of amendments, when the bill was put on its passage, had a good deal of interest. One has only to read the proceedings of February 7 to discover in what a purposed ambiguity the Hepburn bill was left. For example, as we remark elsewhere, there was the sharpest difference of opinion whether the bill covered the express companies or not. Representative Townsend maintained that it did; Mr. Hepburn was as positive that it did not. In order to remove all uncertainty, Representative Underwood moved an amendment explicitly putting express companies under the control of the Interstate Commerce Commission. On the division, the vote was exactly divided—129 ayes to 129 noes. Then came the vote by tellers, and the amendment was beaten, 119 to 146. In the interval there must have been some effective work by the friends of the companies. But all other attempts to clarify the bill were likewise fruitless. The right of judicial review and the power over differential rates were both left in the fogbank where Hepburn placed them. As for the amendment forbidding the railroads to give free passes, it was beaten 111 to 147. That is pretty good evidence of the extent to which the House is eaten up with zeal for railroad reform.

In the debate on Wednesday week, Senator Bailey made short work of Senator Patterson's professions of undying hostility to caucus rule. Senator Patterson, cried Bailey, "owes his seat in this house to a caucus." Moreover, Patterson, before his election, had pledged himself to enter the Democratic caucus, and had declared to his constituents that nothing could be done by a man who stayed out of caucus. Finally, in Democratic caucus two years ago, Patterson had voted for the resolution making a two-thirds vote binding—a resolution which he now regards as cruel, coercive, and undemocratic. When confronted with these facts, the Senator from Colorado was forced to admit them: "I cannot gainsay the record, but it seems that ample preparations have been made to overwhelm me by reason of the stand I have taken." The preparations which overwhelmed Senator Patterson have probably also overwhelmed the San Domingo treaty. The votes of at least four Democrats are needed to confirm it. The bitterness of the late discussion is likely to solidify the Democratic opposition, so that not more than one or two Democrats at most will go with the Republicans. In the event of failure of the treaty, the next step will be an attempt to carry out the purpose of the President by a joint resolution, which requires a mere majority in each house. As to the legality of this method, some of the ablest lawyers among the Republican Senators express grave doubts.

At the very moment when Administration Senators are protesting that the San Domingo treaty will not be used as a precedent, it is used as a precedent. Hayti is in trouble about her foreign debt, and recourse is at once had by the creditors, not to Port-au-Prince, but to Washington. Uncle Sam, in his new rôle of liquidator of all the bad debts in this hemisphere, is called upon to arrange the affair. This was inevitable. As soon as we begin to act as receiver and guardian for one bankrupt republic, the disordered finances of all the others will infallibly be brought to us. We know of no single argument advanced for our intervention in San Domingo which does not apply, or could not be made to apply, to all other republics in arrear and in difficulty between us and Cape Horn. And the greater part of their debts, like those of San Domingo, is practically of the nature of gambling debts. Speculators have simply taken chances as in a lottery, and now we are to guarantee the lottery. President Roosevelt, who a little time ago was speaking complacently in his message about his "police power" over all disorderly republics, and was reported by his friends as determined to straighten out the whole lot of them, now gives it to be understood that San Domingo will be the very last imprudence of the kind. But logic is logic, and a precedent is a precedent, even in a government by non-sequiturs. Hayti's creditors may be troublesome callers at the State Department, just at this juncture, but we may be sure that, if the President's Dominican policy is adopted, they are but the first of a long tine.

In view of Mr. Wallace's clear statement before the Senate committee, how exaggerated appears Secretary Taft's celestial rage of last July! Mr. Wallace declares that he threw up his Isthmian job because he found himself hampered by a person without official standing, though apparently with plenary authority in Isthmian matters. For declining to serve under these conditions, Mr. Wallace was roundly reprimanded as a recreant, and held up to the youth of the land as a horrible example of sordid commercialism. The case is instructive because it shows the passion with which convictions are held at Washington, and because it betrays a marked tendency to regard criticism or dissent of any kind as treason. Now this point of view, whatever its justification may be, is eminently un-American. The right to grumble is one of the unwritten rights of the Constitution. Our Government has always taken the ground that the freest expression of discontent is salutary, and that not the speech or the state of mind of our citizens is to be regulated, but simply their actions. But the Roosevelt Administration has changed all that. It takes a passionate interest in the thoughts of men; it would apparently enforce the French doctrine that a citizen must not be merely well-doing, but well-thinking. On no other hypothesis can we account for the fact that the withdrawal of a Government engineer should be accompanied by a lengthy

reprimand that constitutes a veritable curiosity among state papers; that a journalist should be appointed to guide public opinion aright on canal matters; that the attempt should be made to centralize the distribution of news from the Government departments; that the catching of an obscure reporter in receipt of a petty bribe should occasion a Presidential utterance on "poisoning the public mind." All these instances show that we are leaving far behind old-fashioned, go-as-you-please, American notions of liberty of speech and opinion, and are in a fair way to create a new Federal misdemeanor which, according to circumstances, may be called *lèse*-Theodore, or *lèse*-Panama.

We hear from time to time that American rule in the Philippines is not gaining popularity, but rather losing the little that it had in the beginning. In an article in the *Independent*, the wife of Congressman Parsons tells one of the reasons why. Mrs. Parsons was one of the Congressional party that visited the islands with Secretary Taft last summer. If all the members of the party have brought back as large a stock of political philosophy as this lady acquired, the result cannot fail to be helpful. There is certainly more of light and leading in her brief communication than we have seen in any other deliverance from those daring voyagers. Mrs. Parsons finds it to be a fact that the Americans in the islands do not associate with the natives, not even with the intellectual classes, but hold themselves aloof from and above the Filipinos. They consider the latter their inferiors, and make them so understand. This aloofness is due not to lack of refinement, of education, or of wealth, but to color. It is a reproduction or reappearance of the race prejudice which exists so largely in the United States. Mrs. Parsons calls it "race snobbishness," but this is an infelicity. Thackeray, our greatest authority on snobs, never mentioned one who was particular about complexions. The race prejudice which exists against black men here, and against brown men in Manila, is not classified in the Book of Snobs at all. It is much more pervasive, ineradicable, and hard to deal with. It is not amenable to ridicule, and it goeth not out by fasting and prayer. But all this does not detract from Mrs. Parsons's article, which goes to the very root of our unpopularity among the Filipinos. We have a contempt for them on account of their color, regardless of their mental or moral attainments, and they resent it. Now, since they cannot possibly change their color, however much they may improve their minds and characters, it follows that we shall always hold them in contempt, and that they will always hate us, unless, in the process of the suns, we lay aside race prejudice. Will any modern Imperialist tell us about what time we may expect this "reform within the party"?

Lord North is reported to have said at the outbreak of the American Revolution that he did not know whether his generals would frighten the Americans, but that they certainly frightened him when he came to consider their qualifications. Something of the same feeling must come over any one who studies the list of our regular army major-generals as they stand after several years of what the *Sun* rightly calls "promotion by selection as a result of favoritism and pull." They are Arthur MacArthur, Henry C. Corbin, James F. Wade, Leonard Wood, John F. Weston, Adolphus W. Greely, and Frederick D. Grant. Of these Gen. MacArthur is undoubtedly an able soldier, who seems, however, to have lost his ambition for hard work; his promotion to the lieutenant-generalcy on the retirement from that position of Gens. Bates and Corbin is certain. Gen. Wade, who is anxious to retire at once, is the only one of the seven major-generals who passed through every grade of the line and commanded a regular regiment. Of the others, MacArthur, Corbin, Wood, and Greely left regimental duty as captains, and Weston as a first lieutenant. MacArthur and Corbin served in the adjutant-general's department; Greely as signal officer, and Wood as a medical officer. Grant's total regimental service aggregates not over eight months. This includes a brief period with the Fourth Cavalry in 1872 and six weeks as colonel of the Fourteenth New York Volunteers in 1898. The rest of his regular army service comprises eight years on the staff of Gen. Sheridan prior to his resignation in 1881, and the time he has spent as brigadier-general since his appointment in 1901.

In other words, as the list of major-generals stands, there is only one officer, MacArthur, who could really command the confidence of troops by reason of actual experience and demonstrated ability. Weston is an excellent officer, with the respect of his comrades, but no man, however able, who has spent thirty years in the Subsistence Department as a commissary officer, can be looked upon as competent to manœuvre at once large bodies of troops. Gen. Wade's experience has been merely routine. Brig.-Gen. J. Franklin Bell, who is to be chief of staff in the fall, will probably fill the vacancy to be created by the retirement of Gen. Bates on April 14, and is regarded as an exceptionally brilliant officer, who won his rapid advance by unusually good work in the Philippines, where he served as staff officer and colonel of a volunteer regiment. But even Gen. Bell lacks experience in handling troops. The recent army manœuvres showed very clearly his limitations as well as those of Generals Barry and Bliss, who were also promoted from low rank in the line. As an old colonel recently expressed it, after they had given an order, they were at a loss if circumstances changed. They had not the experience to enable them to handle their men promptly and rearrange their plans at a moment's notice. In the list of brigadier-generals there is not much encouragement. Indeed, if nothing else should incline Mr. Roosevelt to keep the peace, a contemplation of his line generals ought to. Of the entire twenty-three, two, Funston and Grant, were made generals outright; seven came from staff departments, four were jumped from captaincies, and only ten rose through all the regimental grades from lieutenant to colonel. And of the latter class no less than eight will retire for age before the end of 1907.

President Roosevelt dined with his "campaign committee" on Friday evening—Chairman Cortelyou, Treasurer Bliss, and the others. The report is that "congratulations" were exchanged. We must think, however, that condolences were rather the order of the day, with planning how to make restitution of the money wrongfully taken by the committee from insurance companies. We had next day the opinion of the Attorney-General of the State of New York that all the funds paid over by the insurance presidents to Mr. Roosevelt's treasurer were illegal contributions, and are clearly recoverable. President Roosevelt, it will be remembered, has not yet said a word in public reprobation of the course of his committee in soliciting and accepting, to aid in his election, money that rightfully belonged to widows and orphans; but his long silence must mean that he has been waiting simply in order to complete arrangements for the Republican committee to pay back all the sums which it was a shame to have taken at all. Consequently, we look for an early announcement from the White House that it will not be necessary for Attorney-General Mayer to sue for the return of the insurance campaign contributions, since the President has quietly made up the amount among his rich Republican friends, and will see that it is repaid to the policyholders from whom it was originally stolen.

Andrew Hamilton, lobbyist, received $1,347,382.41 from the New York Life Insurance Company. This is the fresh sensation with which the Fowler investigating committee shocks us. How much Hamilon received from other companies we do not yet know. The Fowler committee was able to get at material to which the legislative committee seems not to have had access—accounts of various branch offices, especially that at

Paris. From Paris alone Hamilton drew about $144,000 on the cabled orders of President John A. McCall. In fact, Hamilton tapped the treasury at every possible outlet—for "legal services," for various disbursements, for the "home-office annex," for tax payments, for work with legislatures. Whenever money was to be spent, Hamilton took toll. What he did with all this money was a mystery. A few thousands were passed on to President McCall; but the why and wherefore of those transactions is another dark secret. Certain notes, made by Hamilton and endorsed by either President McCall or his brother, Justice Edward E. McCall, were finally paid from the funds of the company; but the Fowler committee is unable to discover any plausible reason. This juggling of accounts casts the gravest suspicion upon President McCall's integrity. The plundered policyholders, who can find neither head nor tail to this hocus-pocus, inevitably ask whether any of the money handed over so freely, and without accounting, to McCall's "boyhood friend" by McCall's order, ever trickled back into the pockets of McCall or his kin.

Revised plans for the so-called "National Theatre" in this city put that project in a more favorable light than did the first accounts. These, it now appears, were both ill-advised and misleading. They contained features which were socially ridiculous and artistically fallacious. Most of them, we understand, have been cut away. The theatre which it is proposed to open may not even be termed "National"; it will not be the ludicrously snobbish thing that was rumored—no mere preserve of millionaires and hunting-ground of social aspirants; it will not be "endowed," at least not in the sense of being exempt from the need of following business principles in its management; and it will aim to show that the best plays and the best acting will pay. Incidentally, it will, it is hoped, do something, by the exhibition of a higher standard, to educate popular taste away from the depressing forms of recreation which too many of our theatres offer with popular toleration, if not approval. With all these ends now avowed by the projectors of the new theatre, every believer in the educative function of the drama must sympathize.

The action of the Harvard faculty in recommending the abolition during 1906 of intercollegiate football as now played, and until such time as a proper game is substituted for it, should seal the fate of this sport in many other quarters. At Cambridge the Faculty, Overseers, and President Eliot now being opposed to its continuance, it remains for the Corporation also to fall into line—so many governing bodies has our oldest university. That the Athletic Committee will stand out against this decision of the powers is not likely, particularly as the prohibition relates only to intercollegiate contests. It is, moreover, not probable that the kind of game the Harvard Faculty wants can be evolved within a year unless Rugby football is adopted outright. Certainly, such modifications as have been suggested by the new Rules Committee are not sufficiently radical, and from present appearances even those colleges which stick to the game are apparently going to disagree over regulations. The possibility of one kind of football in the East and another in the West is clearly in sight.

The agreement between Harvard, Yale, and Princeton to exclude freshmen and graduate students from all 'varsity teams, is another step in the right direction, since it will put an end to some of the recruiting done in the preparatory schools and in other colleges. Yet efforts will be continued to lure schoolboys to this or that institution, to be trained for a season on second or scrub elevens before joining the 'varsity teams in their sophomore year. And this change will not, of course, end the bad features of the athletic obsession. The evils of gate money, of notoriety, of the public-entertainment idea, the hysterical enthusiasm which leads to many afternoons wasted on bleachers and to the ridiculous organized cheering and singing, are still to be grappled with, to say nothing of the worse than prize-ring spirit and method on the field which President Eliot has characterized so properly.

The Algeciras conference is still working at the problem of policing Morocco. It is a task that France is preëminently well-fitted to undertake. Yet to concede this exclusive right to France would be to withdraw pretty much all the political pretensions of Germany in the premises. There is talk of a compromise—a native police officered by some small neutral Power. But this solution would be worthless unless some strong Power stood behind the European officers. Germany will naturally use all the resources of diplomacy to see that this strong Power is not France. The weakness of Germany's opposition lies in the fact that she has no reasonable excuse for offering her own services, and probably no attractive alternative to French control. When the matter comes to a vote, there can be little doubt that the decision will be for France, with such stipulations as may save the pride of Germany. As for rumors that Germany will "veto" such a decision or withdraw from the conference, we are unwilling to credit anything of the sort. It is doubtful if a right of veto exists; it is certain that to move heaven and earth to get a conference and then decline to abide by its findings would leave the Wilhelmstrasse in a position both isolated and ridiculous. So far as Germany has tangible interests to conserve, the conference will give her satisfaction. On other matters she can well afford to accept gracefully from an international court conditions that she declined to consider on the authority of England and France alone.

No sooner had Chamberlain's schemes been defeated in the English election than they began to be repudiated in Canada. Mr. Fisher, the Canadian Minister of Agriculture, made a speech in Montreal recently, in which he roundly declared that his Government had no wish whatever to enter into a preferential trade agreement with England. Canadian farmers, he contended, did not ask any preference. They were able to hold their own on equal terms anywhere; and so long as the British market was free to them, they did not "ask the British people to burden themselves for the benefit of either Canadians or any other part of the Empire." On the whole, the Minister asserted, he was glad and Canada was glad, that the result of the general election in England was to make an end of the plan of preferential trade within the Empire. So this is what is left of that "offer" of Canada which Mr. Chamberlain affirmed it would be little short of treason for England to refuse.

Mr. Chamberlain has persuaded Mr. Balfour to call a meeting of the Unionist party. Presumably the purpose of such an assembly would be to unify the policy of his Majesty's Opposition, and, in all likelihood, the vote of such a caucus would be given for Chamberlainism in some measure. Mr. Chamberlain undoubtedly controls all that is still afloat of the Unionist flotsam. He hopes, through an impersonal party vote, to give Mr. Balfour that push towards protection which it would be ungracious to administer personally. The chances are that the leader of the Opposition will have to choose between conformity to the Chamberlain programme and self-effacement. Meanwhile, Mr. Chamberlain appears as a champion of Mr. Balfour's very novel doctrine that party disunion is on the whole a good thing. With a dwindling majority, Mr. Balfour was constantly cheerful about permissible differences of opinion; and now Mr. Chamberlain advocates a similar cleavage as the best way of heartening a pitiful minority. He accepts Mr. Balfour's leadership, but urges upon him some comforting assurance as to Imperial reciprocity, and finally declares his intention of handling the protectionist members as an independent Parliamentary group, though in general allied with the Unionist Opposition.

Burlingame Public Lib

HOW NOT TO LEGISLATE.

On the eve of the passage of the Hepburn bill in the House, practically without opposition, Mr. Hepburn admitted that he did not know what it meant. Here is a bill 26 pages long, filled with minutely intricate provisions dealing with the administration of a property billions in value, and affecting all the people of the country. In the course of debate on the measure many sharp questions as to the intent and effect of the language used have been raised. Yet at the end the very author of the bill jauntily waved aside all mere details of "construction." As to the meaning of the words employed, Mr. Hepburn declared, it was "utterly futile" to think of getting "legislative unanimity on that point." "Not a member of the House," he asserted, "could write a twenty-word sentence that would not be capable of two constructions." Well, we should at least hope that any member of the House could state unmistakably that this is not the way to legislate. To stuff a bill with uncertainties and ambiguities and then to refuse even verbal amendments, and hold it up as the utmost reach of the wisdom of the House of Representatives, is a mere travesty of law-making. It makes the House assume towards the Hepburn bill very much the attitude of the old Scotch lady when asked if she knew what the Solemn League and Covenant really was. She replied: "I do not, but I'll mainteen 't." That may be magnificent theology, but it is horrible legislation.

One important matter left absolutely in a cloud by the Hepburn bill is the control of differential rates. This is a subject of vital interest. It involves the whole question of the long haul versus the short haul, and also that of discrimination against localities. In the latter particular, complaints have been long and loud in many parts of the West. It has been alleged, and with a great array of evidence, that railroad managers have selfishly used discriminating rates to build up one town, or develop one region, at the expense of another. A cure for this unfairness was explicitly sought by the Western advocates of railway legislation; but how is the case left by the Hepburn bill? Nobody knows. The point was closely argued on January 30 by Representative Littlefield in his questioning of Representative Townsend, one of the sponsors of the bill. Did it give the Commission power to abolish preferential rates? Mr. Townsend was sorry to say he thought not. He said: "The best authority I can obtain says not." "Others," he magnanimously added, "may understand that the bill confers such a power." Mr. Littlefield cited one member of the Commission who thought it did. He also argued that the power was conferred indirectly under section 3 of the existing interstate-commerce law, of which the Hepburn bill is formally amendatory. But there was no agreement. One member pointed out a glaring disagreement between one clause of the bill and a paragraph of the accompanying report; but trifles like that were not allowed to impede the march to enactment of a bill which its very begetters do not profess to understand.

Many other vexed questions are left undecided. The bill ostensibly includes "cars . . . irrespective of ownership or of any contract." and "all services in connection with the receipt, delivery, . . . and handling of property transported," yet it is denied by some, though stoutly maintained by others, that this brings express companies within the purview of the Commission. Perhaps the gravest doubt of all relates to the right of judicial review. The terms in which this is recited are vague, and their scope highly uncertain. Yet every attempt to make them more precise was voted down. Mr. Townsend made a pronouncement which may well be cited as typical of the confusion of ideas, as regards this aspect of the matter, which seems to reign in the House: "I bow always in proper submission to the decrees of the Supreme Court, and when it announces a decision [as it has done in affirming jurisdiction over "unreasonably low" as well as "confiscatory" railroad rates] I yield it obedience, until at least it has had time to study public opinion sufficiently to reverse itself."

Every one understands, however, why the slovenly bill is put through the House. It is to oblige the President, who wants the matter hurried before the Senate. Any old bill is good enough for the House. The real work of legislation is done in the Senate; so push the thing along and get it over with as soon as possible. If there are clauses drawn with studied ambiguity, trust "them above" to straighten out the tangles. And the House meekly acquiesces in its own stultification. Last year it whipped through the Esch-Townsend bill with only 17 dissenting votes, though, as Representative Sibley asserted the other day, not three members would now vote for such a measure. With similar feigned unanimity and enthusiasm, it passes the Hepburn bill in the confident expectation that it will emerge from the Senate in such shape that its own mother would not know it. Yet one occasionally hears a Representative whining about the Senate's usurpation of power, though perfectly well aware that if the House shirks the real work of framing laws, some Constitutional body must attend to it. All the powers which the House weakly lays down, it may be certain that the Senate will take up with alacrity and treat in its own fashion—and small blame to it.

A DEFENCE OF CONGRESS.

Representative Rodenberg of Illinois has anticipated the reply to those magazine and syndicate critics of Congress which Senator Lodge, or some other great "Expounder," had been expected to make. Into the "veritable vortex of vituperation" and "carnival of calumny" Mr. Rodenberg has rushed with a defence that lacks nothing of confidence. Is it true, he asks, that Congress has degenerated, that the standard of ability is lower now than in those vague "golden days"? No, he tells us. On the contrary, education is so extended that the questions confined to the consideration of statesmen of two generations ago are now discussed intelligently by "the most unpretentious citizen of the land." Mr. Rodenberg himself has found employees of the steel mills of his district "who possess the most expert and thorough knowledge of the perplexing intricacies of tariff schedules"; and it was an unassuming Illinois farmer who convinced the Representative from the Twenty-first Illinois District that the Panama route was preferable to the Nicaragua. Not Bunau-Varilla, nor the seventy jarring experts at Washington and Colon, had been able to do so much.

What is the measure of a statesman to-day who hopes to "win an enduring place in the esteem of his contemporaries"? Mr. Rodenberg answers: "He must, indeed, possess exceptional ability. . . . He is expected to display a genius that is marvellous, a versatility that is mystifying, and a resourcefulness that is more than masterful. . . . Names that stand out in bold relief on the pages of our political history as the bright intellectual stars of the past, would not rise above the level of mediocrity in this enlightened and educated age." Still, Blaine thought that the Thirty-seventh Congress contained some first-rate talent, and pointed to Fessenden, Sumner, Chandler, Wade, Trumbull, and John Sherman in the Senate, and to Galusha Grow, F. P. Blair, Thaddeus Stevens, Reuben E. Fenton, Schuyler Colfax, and a score of others in the House to illustrate his point. He also thought that the statesmen of 1861 had some serious problems to consider; but, as Mr. Rodenberg reminds us, "the world has advanced, and our ideals and standards of statesmanship have kept pace with this advancement." Sumner and Chase and Stevens might have been great statesmen if they had only been spurred on by constituencies of steelworkers who knew all the ins and outs of the Dingley tariff, or of farmers who were able to decide where engineers disagree.

But what about the personal and official integrity of the members of Congress? Are these really evil days we have fallen upon? The gentleman from Illinois thinks not. Here he is most

eloquent in denouncing the writers for the sensational magazines who picture the corruption of the Senate, the influence of corporations at Washington, with the myriad forms of graft. In these days, if a single member of Congress "prostitutes his high office for personal gain, immediately the sensational press of the country inveighs against the entire membership. The pulpit thunders. The pungent paragrapher proceeds to paragraph." It is another Illinois Representative, Mr. Mann of the Second District, who has just issued a statement in defence of the famous "mileage grab," when an extra session ran into a regular session of the Fifty-eighth Congress. One sentence of his bears out the member from the Twenty-first District in the assertion that the morals of Congress are improving. "If I had wanted to 'graft,' I could easily have taken many times the small amount of my mileage, then voted against the payment of mileage, and declared how pure I was and how corrupt others were." Furthermore, Mr. Mann did not vote to pay the mileage because he himself needed or desired the money; he sank his own feeling of repugnance to the plan in order to put others in funds. Thus does grabbing become altruistic.

If Senator Lodge follows Mr. Rodenberg to the end of his argument, he will have his work cut out for him. The Illinois Congressman says that not only has the intellectual standard of our national lawmaking body been raised and its official probity heightened, "but there has also been a corresponding improvement in the personal morals of the members, and in their conception of the true relationship existing between the Government as a whole and themselves." Does even a magazine writer believe that in the days of the Crédit-Mobilier a United States Senator would have been forced to give up his seat by a public opinion that disapproved of his renting, at a fair price, a building to the Government for post-office purposes? Mr. Rodenberg pauses for a reply, and when no one ventures to give one, triumphantly declares that "an incident of this kind at that time would not even have been dignified by an official investigation."

Doubtless Mr. Rodenberg is as well qualified as the next man to discuss the improvement in the moral tone of our national legislators. As a member of the Fifty-sixth Congress, in February, 1900, he voted to strike out the appropriation for the Civil Service Commission; in March, 1901, having failed of reelection, he was made a civil-service commissioner by President McKinley. The reason given was that all the St. Louis Fair commissionerships had been filled, and the President felt obliged to take care of one of Senator Cullom's protégés. At that time the *Evening Post's* Washington correspondent reported that the only regret expressed by Mr. Rodenberg at the change of office was that the civil-service position paid only $3,500 a year, while a Fair commissionership netted $5,000. He held the post a year, then went back to Congress. Evidently, his five years of reflection have not been wasted. His present brief for his fellow-lawmakers at Washington is filled with a zealot's enthusiasm for right—in the abstract.

NEW FIELDS FOR FEDERAL POWER.

"Before many years," said in effect a conservative member of Congress the other day, "there will not be left a department of human life over which the national Government does not somehow exercise control." Great as have been the extensions of Federal functions within a comparatively few years past, there are enough others in contemplation to draw from their graves the statesmen who were arguing against internal improvements three-quarters of a century ago. In the President's last annual message there were no less than eight specific recommendations involving the exercise of new functions, or the assumption of new tasks, by the Federal Government. And if a list were compiled of the suggestions made along the same line by bills now before Congress or resolutions of public bodies—leaving out "freak" bills and constitutional amendments—it would probably be twice as long.

Railroad rate-making happens to be the most conspicuous proposal just at present. This is one of the things the National Government is asked to do because, unless it undertakes the task, it will not be performed at all. The States could not secure the same results even if they all coöperated to the full. The same may be said, of course, regarding the proposed regulation of express companies and national supervision of insurance. Other measures, widely differing in subject-matter, fall into the same general class, because they propose that the Government shall do something not done by anybody at present, or at least not done efficiently. Such, for instance, are the protection of Niagara Falls—in which the Federal power over boundaries may be invoked—the preservation of the Great Lake fisheries by international agreement, and Commissioner Sargent's much-discussed scheme for deflecting the stream of immigrants to those sections of the country where they are wanted.

Next may be classed the proposals which are urged on the ground that the Federal Government should step in merely to give the several States a chance to regulate their own affairs. These, for the most part, grow out of changed conditions. Centres of production and consumption have come to be so far apart, transportation so easy, and travelling so incessant, that local regulations, once amply sufficient, have proved, in many lines, to be little better than farcical. The Pure Food bill owes much of its backing to the fact that a State with good food laws is now at the mercy of one with bad laws or none, which can flood it with impure products; the prohibition communities never cease asking for Congressional action that will undo the "original package" decisions and help the State authorities to stop liquor in transit the moment it crosses the line. Other bills favored by the same interests wish a law that will make the records of the internal-revenue office more useful in the prosecution of illicit liquor sellers. The national quarantine law, which, as always after the threat of an epidemic, is being strongly urged this year, would similarly save the neighboring States from the consequences of the laxity of any one. And President Roosevelt's recommendation that the criminal process of each State be made to run throughout the entire country, bears somewhat the same relation to moral health.

Finally should be mentioned those instances in which national action is urged chiefly to secure uniformity of system in some department. The practical restriction of naturalization to the Federal courts, as recommended recently by a commission, is one example, and another the partly completed extension of national trade-mark legislation; while the national child-labor law, strongly pushed by a State labor commissioner recently, though without citation of the constitutional provision which would authorize it, is a type of many benevolent measures so advocated. Though several of these have been actively opposed and some kept from passage for many years, the argument, on abstract principles, of danger from the assumption of additional functions by the Federal Government is almost never heard. In fact, it is remarkable how much support such measures have in the old region of jealous States'-rights sentiment. The national quarantine is distinctively a Southern measure, the liquor shipment bills are most strongly advocated there; and as for pure food, two Southern States are the only ones which, by a provision of their State law, have made the food standards of the Secretary of Agriculture go into effect within their borders as fast as promulgated. So a number of Southern as well as Northern States have voluntarily turned over their quarantine stations to the Public Health and Marine Hospital service.

Efficiency has come to be the controlling argument in most of these cases. Our National Government has a way of getting things done—not economically, perhaps, but effectively—that the States

simply stand by and envy. The illicit liquor-seller, who defies the sheriff and the chief of police, would not dare to run for a week without paying his Federal tax. The Federal officer, in any line of work, is freer from hampering local influences and is apt to be backed up more firmly in doing his duty. The present advocacy of Federal control as a general panacea is really not so much an indication of changing Constitutional views, as a tribute to the relatively effective way in which power is applied from Washington.

TRUST COMPANIES AND BANKS.

There are many peculiar and unusual aspects of the controversy which came again to a head at last week's legislative hearing at Albany over compulsory cash reserves of trust companies. The New York Associated Banks, three years ago, peremptorily demanded that, if the trust companies wished to retain the right of exchanging checks through members of the clearing-house of banks, they must, at stipulated intervals, increase their ratio of cash reserves to deposit liabilities until it stood at 10 per cent. The trust companies answered that, while they might have considered such a proposition in an equal conference, they would accept no dictation from the banks; and most of them promptly withdrew from clearing-house connections, asserting that the banks were jealous of the competitive achievements of the trust companies, and were striving to clip their wings. To this the banks retorted that the assertion was true in so far as the trust companies did a banking business pure and simple without the restrictions imposed upon the banks. Such a condition, some of the spokesmen for the banks alleged, was distinctly unfair, not to mention possible dangers involved by such exemptions for the future of trust company finance. So this curious game of recrimination has gone on. Trust companies declared that their own deposits in bank, which were very large and on which the banks pay 2 per cent. interest, were a sufficient guarantee of safety without a cash reserve. Banks replied that they themselves kept only 25 per cent. cash against such deposits, and that, even supposing the trust company fund in bank to be 25 per cent. of the corresponding deposit liabilities, there would still be held, to protect those liabilities, not 25 per cent., but only a trifle over 6 per cent. Trust companies rejoined to this, Why not increase your own reserve, then? Banks retorted, We cannot afford to do it; the burden should fall on you. And so an interminable controversy—a prolonged argument in a circle, always ending where it began—has pursued its course.

We have felt from the first that the party whose interests, really paramount, have not been sufficiently considered, is the general public. Believing this, we have thought that the proper solution of the matter lay in legislative action regarding trust-company reserves. The whole discussion has been so clouded, hitherto, by the constant insisting on non-essentials that sight has been lost of the fact that, under the present law, trust companies in New York State need not keep a dollar of reserve, either in their own vaults or in their depository banks. If it so choose, one of these companies may invest every dollar of its depositors' money and all of its capital and surplus in securities or time loans.

The right to do this was conferred on the trust companies when their exclusive functions were conceived to be, in the language of the law, "to act as fiscal or transfer agent," "to act as trustee under any mortage or bond," "to act as guardian, receiver, or trustee," and "to take, accept, and execute any and all such trusts and powers" as might be conferred upon them. So long as the strict intent of the law of 1887 was carried out, it may readily be conceded that no cash reserve beyond a trifling "working balance" was required. Every one knows, however, that the trust companies as a whole have departed very far from this simple conception of their powers and duties. Unquestionably, there are companies which to-day hold as strictly to the function of administrator and trustee as they did a dozen years ago. But such institutions are now few in number. Many of our trust companies are in reality nothing but deposit banks, doing their business free from the restrictions imposed by the deposit banking law. Most of them do both kinds of business; but with these the part of the business made up of pure deposit banking has increased in a vastly greater ratio than the simple trust department. In January, 1898, the reports showed $185,099,694 "deposits in trust" against $198,229,029 "general deposits"; that is to say, the two kinds of business nearly balanced. In January, 1905, "deposits in trust" were $275,665,112, whereas "general deposits" had risen to $695,031,064. The form of report was somewhat changed last year; but analysis of the returns of November 9, 1905 (made when a call for reports was not expected, and when the showing was therefore more trustworthy), indicated something like $900,000,000 deposits precisely on the footing of deposits in the banks, $816,529,425 being, in fact, described as "deposits subject to check."

Against this $900,000,000, the companies then held 2⅜ per cent. in cash on hand, and 12¼ per cent. in cash on deposit in other institutions. Let it be observed that this ratio applies only to deposits not of the trustee or "time deposit" order. If all the deposit liabilities reported November 9 were to be included, the ratio of cash on hand would be slightly under 2 per cent., and of cash on deposit 9⅞ per cent. But, even as to this, it is important to observe, there is no compulsion; and, in fact, it is well known that the average ratio is raised by the strong position maintained by a few large and conservative companies. Very nearly half of the cash held by all the eighty-one trust companies in this State, as shown by the Banking Department's last report, was in the hands of six institutions.

The question, in our judgment, clearly is, not whether there shall be a reserve required from these institutions, but what that reserve shall be. The terms submitted at last week's hearing by Mr. Borne as satisfactory to the trust companies were 3 per cent. in cash, 6 per cent. in investments, and 6 per cent. in deposits in other institutions. This strikes us as both inadequate and unscientific—certainly so in the case of the numerous trust companies which do a simple deposit banking business. The proposed law, on the other hand—a 15 per cent. reserve for large city institutions and 10 per cent. in smaller localities, half in cash and half in deposits with other banks—appears to us extremely moderate, save, perhaps, in the single case of companies acting purely as trustees and conducting no simple deposit banking business. The plainest solution would be separation of what in reality are the two distinct branches of the trust company accounts, exemption of the one from reserve requirements, and imposition on the other of a reserve ratio at least as high as the pending bill requires, and preferably higher.

NOTES ON EDUCATION IN MEXICO.

JOHNS HOPKINS UNIVERSITY,
January, 1906.

Having just returned from a visit to the great Republic to the south of us, I venture to write down certain observations made under conditions which were in some respects exceptional. It is singular that we as a people are so ill-informed regarding Mexico—I speak as one who until now would have owned up to the charge—and that so great a nation has grown up at our doors without attracting more attention. It is true that the capitalists, promoters, mining-boomers, and people generally who have irons to heat in the fire, have discovered Mexico; but, apart from the interest recently stirred up in connection with pan-American politics and the Monroe Doctrine, and the meeting of the five-years-apart conferences of American Republics, little knowledge has been diffused abroad among us as to things intellectual, or in the large sense "moral," in the Republic. Indeed, the feeling creeps into one's mind as he sits down to write, that perhaps the duty of the hour now is to give further impulse not so much to the material forces at work to cement the States, as to those more conservative but intangible forces which make for common moral

effort among the nations of America. It is undoubtedly true in the educational field, at any rate, that we are lamentably ignorant of the institutions of Mexico; and it is no doubt also true that this ignorance has been the cause of the lack of effort to bring about any sort of reciprocity and co-operation between that State and our own.

I went down by arrangement with Señor Justo Sierra, the new Minister of Public Instruction and Fine Arts of Mexico, who extended to me a hospitality most generous and unstinted; and I spent some days in touch with the Department in the City of Mexico. The time was well chosen for observation generally, and more particularly for observation of the educational institutions, for with the New Year the academic year begins, and the formal opening functions, under the direct patronage of the Minister, then take place. The academic year runs continuously from January to November, with a short Easter recess; and what we call the "long vacation" comes not in summer, but in the fall, covering the two months November and December. This is as suitable an arrangement as any other, in a country in which the climate is equable—the temperature on the great tableland being about 60 to 70 degrees Fahrenheit all the year round. It must be remembered that Mexico is, apart from the narrow strip of sea-level on both coasts, a great plateau varying from six to ten thousand feet above the sea, and that one has while staying there the same climate that so many of us have been going to the Engadine to secure. The schools, then, may remain open all through the summer, and all through the year, in a latitude usually associated by us with torrid heat, malarial fever, and insects galore; for none of these things are present.

Another general educational fact that becomes more apparent the farther one indulges his curiosity, is the sharp distinction, in all matters of more than purely local interest, between the affairs of the several confederated States and those of the Federal District of Mexico. Politically, the distinction is the same as with us. Our District of Columbia corresponds to the Federal District of Mexico. But in the latter country the Federal District is, as it is not with us, in many respects the *essentia et substantia* of the Republic. In matters of civilization and culture, of education and art, of literature and what would be called broadly the "affairs" of the country, the Federal District is Mexico, and Mexico is the City of Mexico. In matters of public education, for example, the two interests are in most strongly marked contrast. The States, of which there are twenty-seven, differ as much in their laws as do ours, but, more than that, the States on the one side and the Nation on the other have essentially different problems on their hands. In Mexico City there is a large cultivated and graded population, showing all the forms of cosmopolitanism that one would expect in a city having its history. There are traditions of Spanish as well as of later Mexican origin that give literary and artistic flavor to the life of the metropolis. In the matter of architecture alone a single significant fact, pertinent to my present point, is this—that the higher institutions, the School of Music, the School of Fine Arts, the Preparatorium (the institution giving the highest "arts" course), and many other similar establishments are now housed in the fine old Spanish structures which exemplify the splendid art of the Spanish Renaissance. There is background and atmosphere to the life in Mexico City which not only is absent, but will perforce continue to be absent for years to come, in the great State areas of rural Mexico. In the States, the population is more largely Indian—the North American, pure and undilute, though indeed less "undilute," as appears from statistics, than is generally supposed. Yet the problem of education, outside the Federal District, is that of furnishing a good and free common-school education to the Indian boys and girls whose parents live in adobe huts and serve the great hacendado or ruler of the plantation. The owner of the hacienda has often the entire responsibility of providing schools in his territory.

The result is that, in the States, one finds primary education about all that is to be looked for—with important exceptions, of course. President Diaz himself, in a long and animated conversation it was my privilege to have with him, said that the great educational problem confronting his country was the training of the millions of Indian children. It is in the Federal District, therefore, and of necessity, that the impulses of the higher training first make themselves felt; and they are already of great strength and promise. The present Ministry of Public Instruction and Fine Arts dates only from last year, when the Department of Justice, formerly joined to it, was separated off, and the Minister of Public Instruction now in office, the Hon. Justo Sierra, was appointed to his present position. This step itself is recognized by the President as one of his important moves, and in this I think competent opinion would agree with him. Señor Sierra is a man of fine presence, large in every sense, genial and popular, and at the same time, being himself a teacher by training and by right of success, fitted to deal with the questions proper to the bureau. It is under his direction that the Government has recently issued the superb work, 'Mexico, Its Social Evolution,' in three large quarto illustrated volumes, with which certain of our libraries and public men have been favored. In this work, indeed, the treatise on Education, written by Señor Chavez (now Sub-Secretary), will be found of great interest.* Señor Sierra is also known as one of the legislators to whom the country owes the compulsory-education law of 1888.

Señor Sierra is seconded in his work by others who hardly yield to the chief in zeal and information. I may take pardonable professional pride in calling attention to the fact that the Sub-Secretary, Sr. E. A. Chavez, is by common consent the leading psychologist of Mexico. He was professor of psychology in the Preparatorium before his appointment to his present position; and he has done important service in rendering into Spanish certain of the classics of logic and ethics—notably the 'Logic' of Mill and the 'Ethics' of Spencer. It is of especial interest to us that his latest translation is of the 'Primer of Psychology' of our honored psychologist, Professor Titchener of Cornell—a book whose physical size is much enlarged in the process.* Señor Chavez, whose interests and competence are shared by an able staff—among them Sr. J. J. Tablada, one of the best-known contemporary poets of Spanish America—is a man of large views and positive measures. Under his direction—and with the sympathy and endorsement of Señor Sierra—we may expect the details both of reform and of new organization to be informed with good psychology and adjusted with practical judgment.

As to the institutions themselves, much has been already done. The normal-school problem was attacked a half-generation ago by a wise minister, Baranda, and by a man whose name remains in Mexico a great educational force, Enrique C. Rébsamen, son of a Swiss father. At the time of the latter's death, two years ago, the Normal Schools, one for each sex, were already great and influential. Many of the coming men in education in the metropolis confess that their interest and competence are due to the inspiration of this great teacher. His mantle seems, indeed, to have fallen on other shoulders. The primary and secondary (called in Mexico "superior primary") instruction of the District is in the hands of Señor M. F. Martinez, who is at present in the midst of a series of wide and generous projects. He is building nine schoolhouses, which, to judge from the two just completed, are to be models of what convenient, hygienic, and "fit" school-buildings should be. He is also interested in forwarding the manual-training movement, in which good beginnings have been made. His son is in charge of the manual courses in the Normal Schools, bringing to the task the results of two years spent in New York; and manual training has already been introduced in the country schools. A quite proper distinction is made—that is, proper in the present writer's opinion—between the modes of manual work appropriate to boys and girls respectively. I was shown the work of the village of Xochimilco, lying in a rural environment, where seven schools are conducted under Sr. Martinez' administration. It is a typical Indian village, in the midst of the tangle of canals that are called the Viga, near Mexico, and comprises the well-known chinampas, or floating gardens, where much of the garden produce is raised for the metropolis. The work of the girls in the schools of different grades was exhibited, and a collection presented to me to bring away. It is extremely good—drawn linen, silk embroidery, and other products of the needle that only a woman could properly describe, all of which would do credit to the skill of professional needlewomen and lace makers. The work exhibited in Mexico City from the boys' schools shows good beginnings, but is still in its infancy compared with the finished output of our own great manual-training schools. Sr. Martinez, it may be added, was formerly identified with the school system of the growing town of Monterey, which is becoming the centre of American influence in the Republic.†

The higher institutions seem to have been formed after models more of the

*The same may be said, indeed, of the other chapters of this important work, dealing with all the great aspects of the Mexico of to-day, and written by leading native authorities. Sr. Sierra was himself the "literary editor."

*It seems that we all acquire increased outward importance in the translation process. A Spanish version of a little text-book of mine, the 'Elements of Psychology,' of which I was first informed while in Mexico, has become, from a small pocket volume, a great tome two inches thick!

†He is also author of a valuable 'History of Elementary Instruction in New Spain.'

French than of any other national type. It is, indeed, to be remarked that in many ways French civilization is more really alive in Mexico than any other, save, of course, that which survives the Spanish occupation. The effect of this *rapport* shows itself in the ability to use the French—in text-books, sources, etc.—and also in the actual organization of the schools. No doubt much is due to the direct influence of Barreda, a student and disciple of Comte, who headed the Commission of 1867 for the reorganization of the Preparatory School.

There have, indeed, grown up, somewhat as in Paris, great schools vitally issuing from some actually present cultural root, so to express the matter. The School of Fine Arts is connected with the art collections and with actual architectural projects; there is to be a school of Archæology, Anthropology, and History, built upon the existing Museum of Mexican Antiquities; the School of Commerce is a practical vehicle of actual commercial instruction for both sexes, and so on. This is somewhat the origin also of the schools of Paris, whose thorough amalgamation into a university would bring them into more organic relation to one another. In Mexico, the advantages of this have been, of course, those of an immediate, pragmatic sort: relative utility, relative lack of waste, relative directness in ministering to the demands of the national life. But the defects have also been felt, such as are apparent in other countries, viz., lack of solidarity, lack of *esprit de corps* and "team-work," and, above all, lack of some of the institutions necessary to fill out the scheme of culture. There has been wanting anything corresponding to the École des Hautes Études, or to our university faculties of philosophy, pure science, and what we denominate liberal arts of university grade. The nearest approach to our Arts course has been the curriculum of the Preparatorium, an institution corresponding fairly well to the American College, which fits its graduates to enter directly the schools of Law, Medicine, Engineering, etc. This, of course, has left great gaps in the system which only those actuated by motives of a more theoretical and directly cultural sort would care or endeavor to fill. There have been important contributions to science coming from Mexico; one recalls that the Hodgkins prize awarded by the Smithsonian Institution in 1895 went to the important study of Life in High Altitudes by the well-known teachers respectively of biology and physiology in the Normal and Medical Schools, Srs. Herrara and Vergara Lope. But as Sr. Chavez himself remarked to me, in our discussion of the subject, such work has been the result of direct individual endeavor. Literature and science alike have not had the aid or support that would come through institutions in which their pursuit is made more dignified from being official and collective.

The new National University project is, however, taking form. It has just been made the subject of an official announcement. On January 8, the day of the annual formal opening of the Preparatorium, the writer had the pleasure of attending this function with the Minister of Public Instruction. In the address which was asked for he made somewhat the same reflection as that written out above, and said that the great further need was that of a National University, a school devoted to Science, Literature, Philosophy, and Art for their own sakes, a school of research and production. This would bring unity and wholeness to the educational body. This was followed by the remarks of Minister Sierra, who at once rose to his feet and said that the Government was prepared then and there to announce the intention of establishing such an institution, which should constitute, with the schools already in existence, the National University of Mexico. This project was to be, he said, together with the establishment of the great National Theatre already taking form in a suitable building, the contribution of his Department of the Government to the Centennial Celebration of Mexican Independence to take place in the year 1910.

This announcement was received, it may well be imagined, with great applause, and the newspapers the following day commented upon it as one of the most important measures which modern Mexico owed to the Administration of President Diaz. In another address, delivered at the opening of the Normal School, I could not refrain from pointing out that the United States had neither a National University nor a National Theatre, and that in these things Mexico, coming first, was entitled to be called the leader in the development of one set of the group of interests we are coming to call Pan-American.

There are now in operation schools of Agriculture, Law, Medicine, Commerce, Fine Arts, Engineering, Music, Teaching (the two Normal Schools), Arts (in our college sense), and there will be established in the new university in addition departments for Pure Science, Philosophy, Literature, Archæology and History, Arts and Crafts, and Political and Social Science.

When one thinks of certain facts of history—the closing of the old University of Mexico, a Jesuit institution that flourished during the Spanish occupation; the conditions of confusion and paralysis that extended down late in the century, before stable government came to modern Mexico after the term of the French Intervention; the economic and racial problems with which the country has had to deal, as illustrated by the reform in finance,* only just now being brought about by that genius, a Frenchman, Limantour, the present Minister of Finance, together with the restricted scope and place, the Federal District, in which alone the problems of higher education are even yet of any pressing urgency—when one thinks of all this, it becomes evident that in such steps as these the Government of Diaz is proving itself to have extraordinary vitality and moral power. Commenting upon the proposed University, the President, in the interview referred to, declared that Minister Sierra should have all the money he needed to carry the project through. This may be commented by the remark that in his annual report, issued about the same time, Minister Limantour reported a credit balance in the national treasury, and submitted an increased estimate of receipts for the ensuing year.

So much for the spirit of the new Mexican educational life. In a report which I have promised to write out for the Bureau of Education at Washington, more detail will be appropriate. It will, however, no doubt be evident what lesson we should draw from such a movement on our southern border. We have taken interest, sometimes a servile and very imitative interest, in institutions across the sea; we have recently heard much of international co-operation and alliance in our educational operations, motived by interest in a larger fraternity and moral community: why should not this interest find an outlet here in Mexico, where a virile national life is assimilating its material from every source? In the matter of language alone, the opportunity is as great as the need: we need Spanish, they need English.* Mexicans, both teachers and students, might attend our universities in the fall term, which coincides with their long vacation.

I find that men going from us—either professors or students—would not only be welcomed, but acclaimed and honored. Things Pan-American are in the air, conferences are arranged to conserve commercial and political interests; why not such things in education, science, art? I found the Department of Public Instruction cordially open to such suggestions. It is likely that an official delegation will go from Mexico to the National Educational Association at San Francisco in July next, also visiting the summer school of the University of California.† It would be a capital thing should the American Association for the Advancement of Science hold a winter meeting in the City of Mexico; witness the procedure of the British Association in going not only to Canada twice, but this very year to South Africa! Certainly the members of the American Association would have "the time of their lives," and the international good to result would go far to leaven many of the lumps of misunderstanding over which the politicians are living the strenuous life. Indeed, there are many ways in which this lesson might just now be very practically read, and in these ways we men who work in science and literature and the arts may second the endeavors of those who are striving to bring in the day of a more united American continent.

J. Mark Baldwin.

*It happened during my visit that the Government officials were paid for the first time part (80 per cent.) of their salaries in the new gold coin—a beautiful piece of five Mexican dollars bearing the eagle and snake of the national emblem on one side, and on the reverse the head of the patriot of the Revolution, Hidalgo.

*Señor Javier Arrangoïz, Director-General of Customs, who is also Director of the School of Commerce, hopes, with the aid of Mr. H. N. Branch, Professor of English in the School, to establish a system of correspondence between pupils in Mexico and the United States. I should be glad to serve as medium of communication for any teachers who wish to join in such a scheme.

†Since writing this I have heard from Prof. E. C. Moore, Dean of the Summer School, who happened to be in Mexico when I was, that Sr. Chavez has been asked to lecture at Berkeley this coming summer. Lic. Orci, also an official in the Department, is coming this spring to the Johns Hopkins for advanced work in psychology.

INTERNATIONAL SOCIETY OF SCULPTORS, PAINTERS, AND GRAVERS.

London, January 8, 1906.

The International has already, in its six years, accomplished an important work. It has introduced into London the art of the world which was hardly known there before. It has carried into the English provincial cities exhibitions such as had never

hitherto been seen in them. It has become—Instead of the Royal Academy, the so-called national artistic body, but really the tomb of national art—the association of the artists of the country, to which foreign Governments come when they wish to organize British sections in international exhibitions abroad. If the shows which it held in America were not altogether what was expected of them, that was wholly the fault of some of the artists, who were not intelligent enough to take advantage of their opportunities. Nor has the International been content to introduce good art into England; it has tried no less for good arrangement, both in the placing of the work exhibited and the decoration of the galleries. And last, but not least, the most important thing of all, the International has vindicated the name and reputation of Whistler, its first president, and given him the position he had been denied all his life.

This Society has just opened in the New Gallery its sixth exhibition, which in main respects differs but little from its five others. One striking innovation, however, has been made. The "Gravers"—the word is Whistler's—do not appear now at all, but their section, which has so far been the most successful of the three, and includes water-colors and pastels as well as prints and drawings, is reserved for a separate show, to open toward the end of this month. In the absence of the Gravers, there is no question that the sculptors monopolize the interest. Once more, the central court has been converted into a stately white temple, Rodin's "Baiser" taking the place of his "Penseur" of two winters ago. "Le Baiser" is well known; the surprise is to see it in a London gallery. It need hardly be described, so often already has its beauty of form and design been pointed out. Rodin has never done anything more perfect than these two figures, so superbly and sympathetically modelled, the contrast between the muscular strength of the man and the delicate grace of the woman so learnedly suggested, such charm and passion in the pose, such rhythm and stateliness in the outline, where Rodin of late deliberately fails. It represents him at his finest and sanest, before he launched into the experiments and eccentricities and mistakes which, unfortunately, his admirers and disciples have praised until the public—the sheep following whithersoever they may be led—have come to believe that in these lie the measure and fulness of his genius. The "Baiser" makes it the harder to understand his reason for the awkwardness, the formless silhouette, of a work like the "Paolo and Francesca," occupying a centre in another room. In this the figures emerge, in the now familiar fashion, from a great shapeless rock, but, in emerging, they have not the grace and loveliness of some of his other little groups of the same kind. They lie clasped in an almost clumsy embrace, their outstretched arms repeating an ugly line and gesture. Whatever meaning there may be is lost in the chaotic arrangement.

After M. Rodin, the late Constantin Meunier, the Belgian, and Mr. Paul W. Bartlett, the American, are the two sculptors who appear with the greatest distinction. There is an unusually fine collection of Meunier's work: small bronze reliefs, statuettes and busts of the subjects that were his inspiration—the miners and laborers and peasants, in whom he saw as much beauty as the Greek sculptor saw in his gods and in the priests and youths who sacrificed to them. Meunier, still more than Millet, ennobled labor and knew how to express all that there is in it of heroism and grandeur. The heads have character; in the reliefs, men and women and beasts move in rhythmical unison; the oldest and most wrinkled and worn women of the people have a tragic dignity—the dignity of the type. And all this little collection has been so well arranged where it fills one side of the court, that never yet, not in Paris or Antwerp, not in Brussels or Liège, have I felt the force and truth and impressiveness of Meunier as now in the New Gallery. But the Belgian's reputation had reached London; not so the American's. Mr. Bartlett is a newcomer, but he has proved an immediate and, among artists, a sensational success. He has sent the series of small bronzes that won him fame and the highest honors at St. Louis—the graceful vases, the little figures as perfect as if unearthed from some old Greek tomb, the marvellous fish and lions—marvellous in their harmonious line and graceful form—the torsos so well studied, so sensitively modelled. And he reveals, in addition, so much feeling for color that his work gains a quality sculpture does not always give. I have never seen any of Mr. Bartlett's more ambitious work—more ambitious, that is, in size—that could in any way approach these small and exquisite bronzes.

M. Bartholomé has already contributed more remarkable sculpture to the International. His "Adam et Eve," a learned academical exercise, in so heroic proportion that it is quite out of scale in the court, and his other two exhibits, "Jeune Fille se Coiffant" and "Au Bord de l'Eau," seem insignificant from the sculptor of the monumental tomb to the dead at Père-la-Chaise. Mr. Wilson, who is retaining some of his work for the February exhibition, has only an excellently designed "Pietà," a relief for the private chapel at Welbeck Abbey. Mr. Furse and Mr. Wells are other of the more notable exhibitors. And there is nothing else for me to mention, unless it be that Mr. Havard Thomas, the late notoriety, sends a relief that I wonder to see hung in this small but fine collection, and that Mr. Ricketts, the universal genius, has this year descended upon sculpture.

The painting, it might as well be admitted frankly (or rather the British part of it), includes much that is distressingly commonplace and more distressingly bad. The Scotchmen, as a rule, are too poor for notice; the Glasgow School, for the moment anyway, have gone to pieces—there are only a very few exceptions. The galleries themselves are as effective as ever at a first glance. Walls draped with grayish white or pale neutral green make the best possible background, the pictures are hung fairly well, though not with the thought and care devoted to the Whistler Exhibition last year. However, there is no clumsy crowding as at the Academy, and you feel that so much attention and respect could not have been lavished upon work without genuine merit. The truth is, after the first glance, you see only too plainly that most of the work is of the smallest merit, if any. The International, with Whistler as its president, started for the avowed purpose of exhibiting all that is finest and most individual in modern art everywhere, without any foolish limit of school or nationality. In one particular it has not wavered: it is international in its selection of work as in its name. But the selecting committee of painters should have been more rigid in their standard, and their weakness is the more unpardonable because the sculpture committee have so splendidly shown them the way. It may be thought that, as the best work comes from abroad, this is proof of the breadth and liberality of the painters. But for so much poor work the foreigner is also responsible that one fears the lack of judgment has been even greater than the liberality. However, when the Academy is remembered, when the bad hanging, the insularity, the dreadful decoration of most of the London exhibitions is considered, one is the less inclined to criticise the International too severely. The trouble is that it has already done so much that the suggestion of anything like a falling away from the high aims with which it set out is at once resented.

One of the most interesting things to me in the exhibition is the attempt to obtain a representative showing of American artists. Little is known over here of what is being done by the American artist at home. The American artist in England is known well enough for the English to be eager to appropriate him, and so we have Sargent and Abbey and Shannon in the Academy, and the amazing spectacle of Whistler figuring as a painter of the British school in a National Gallery. The American artist in Paris sometimes sends to London, where he has at least been heard of. But that there are artists, and distinguished artists, quietly working in their native land, no Englishman would condescend to believe. As a strong endeavor to prove that there are has been made this year, the pity is it should not have been more thorough and more successful. The Pennsylvania Academy has contributed six or seven pictures, but only three out of these do the painters full justice. There is the very beautiful "Mother and Child," by Mr. De Forest Brush, and I am glad to see it is receiving as much attention in London as it received in Paris in 1900—the attention it deserves. The golden "Sheep Pasture," by Mr. H. W. Ranger, is distinctly one of the finest landscapes in the entire exhibition. "People at Breakfast," that well-studied and well-observed interior, by Mr. E. C. Tarbell, is most interesting, and Mr. J. De Camp's "Little Hotel," though rather commonplace, still has character. But the pictures by Theodore Robinson, Winslow Homer, and Mr. Eakins should never have been sent, nor a painting of flowers by Mr. Alden Weir, lent by a private owner. Nor has Mr. Wiles been discreet in the choice of his portraits. The American may be perfectly well aware of the distinguished and strong work these artists have done; but the Englishman is not, and he scarcely would imagine it from the performances by which they are now represented, while the absence of men like Childe Hassam, Dewing, and many others, is greatly to be regretted. It seems always the way when American work is exhibited in London. Even Mr. Chase, a member of the International

—he has nothing this year—usually prefers to send indifferent portraits rather than his masterly renderings of still life, like his fish, for instance. And as for the New York Water Color Club, when the members held an exhibition in London last spring, they did themselves anything but good by it. However, I hear that a genuinely representative series of drawings and prints has been prepared by American artists for the International's approaching second exhibition, and I hope it will make up for the disappointment that I, anyway, have had in the pictures.

There is reason for disappointment in most of the other foreign sections. From Germany, though the National Galleries at Berlin and Cologne contribute, comes little of note, save a large, powerful landscape by Von Bartels, "The Flemish Inn," a wide stretch of wind-swept flat meadow land, and lines of wind-swept poplars under a dramatic sky. From Holland and Belgium comes hardly more: two or three not very remarkable Israels, a Bauer not so good as pictures the artist has had in previous shows, a Mesdag, and two paintings by Buysse, amazingly full of observation—one an impression of sunlight and mist on a frosty morning; the other a Flemish canal in the early hours of a September day. Italy would not count were it not for a characteristic Segantini, "Early Spring"; while, for some reason I fail to understand, those always amusing and often daring young Spaniards, Zuloaga and Anglada, have given place to their much less interesting countryman, Sorolla y Bastida. Thaulow carries off all the Scandinavian honors.

The French, however, appear more triumphantly, not solely in a group of the Impressionists, but in the contributions of the younger men influenced by them. Manet, Monet, Sisley, Pissarro, Renoir, Degas, Berthe Morisot, even Cézanne, who is just at this moment enjoying an exaggerated reputation, are all included: Manet most notably in "Le Linge," a good example of his "peinture claire"; Monet most delightfully in "Antibes," one of the earlier landscapes that are reminders of the beauty he once allowed himself to see in Nature. The Carrières are fine, "Maternité" and "Mère et Fille"; but I have spoken of them when they were exhibited in Paris. Two of the Besnards are wonderful impressions of majestic cloud storms gathering and threatening above a wide sandy beach. M. Boldini's "Mrs. E. A. Salaman" is one of his extraordinarily clever and audacious performances, and M. Aman-Jean's portrait of a lady, from the New Salon, has the usual charm. Raffaëlli, Cottet, Simon are by no means at their best. And, altogether, my interest was greatest in a nude by M. Louis Legrand, the hackneyed motive of a woman at the bath, treated with such knowledge of form, such subtlety of modelling, such a delicate sense of color, that it has all the originality of a new technical theme—a little masterpiece. Hardly less astounding are two small Vuillards, a woman at her toilet, and the corner of a room—"Chambre de Garçon"—both with that fine quality of paint that makes Vuillard the delight of artists. And with these I must place four paintings by Forain, two of dances that suggest the influence of Degas, two of lawyers as suggestive of the influence of Daumier, but all admirable in the personal adaptation of models set by great masters.

As I have said, it is among the British members one comes upon the most hopeless commonplace. This, no doubt, is the fault of having "members." However, when the commonplace is disposed of, some good work remains. Mr. Lavery, the vice-president, is at his best in "The Ladies Evelyn and Norah Hely-Hutchinson," for the arrangement of the sisters sitting side by side is so decorative in pattern, the color is so agreeable, that it is easier to forget the unpleasantness of the technique and the utter insignificance of another of his portraits hanging opposite. Sir James Guthrie has an effective full-length of "The Marquis of Tullibardine," in khaki; but, apparently, he has hesitated between his desire to render all the detail and his deference to the methods of Whistler, with, as result, weakness throughout and an irritating restlessness. A portrait of a lady by Mr. Charles H. Shannon is more disappointing, for Mr. Shannon is an artist from whom, if one never expects strength or the knowledge of a painter like Legrand, one does look for a decorative arrangement. But the figure is placed so low on the canvas as to lose all graciousness as well as dignity of design, while the color scheme is so low in tone that only with difficulty does one make out the design at all. Better are the portraits by Mr. Nicholson, who of a sudden, however, shows an inclination to reëcho Mr. Sargent when one would so much rather see Mr. Nicholson himself. But best of all is Mr. Greiffenhagen's portrait of his wife, a graceful figure standing in graceful pose, the simple dress the excuse for a lovely harmony in black and silver, the only stronger color in the flesh tints of the flatly modelled face and the pale roses of the hat. There are admirable landscapes by Mr. Peppercorn, Mr. Mura, Mr. Oliver Hall, Mr. Bertram Priestman. And, if I add that there is also work by Mr. Strang, Mr. Pryde, Mr. Ricketts, Mr. Conder, I have said enough to give a good idea of the scope and variety of the most important annual exhibition of modern work now held in London. It will be interesting to see what the "Gravers," whose section has hitherto been the most important, will make of an exhibition all to themselves. N. N.

THE RUINS OF ANGKOR.

SAIGON, November 30, 1905.

French Indo-China is much less visited by travellers than it deserves to be. This is in part because the ordinary tourist is hardly more than aware of its existence, or, if he has any impressions about the country, they are pretty certain to be unfavorable, based on the common assertion that the French do not know how to colonize. In part, too, the neglect of these regions by the globe-trotting public is due to the fact that the means of transport are still unsatisfactory. Thus, though the boats of the Messageries Maritimes stop at Saigon, one must, in order to visit Tonking, either retrace one's steps northward for some distance, or else take at Hongkong a decrepit little steamer whose date of sailing it is impossible to find out much beforehand. Even the service along the coast from Haiphong to Saigon, though comparatively regular, is not really good. All this is a pity, as there is plenty to see. The landscape is picturesque, for the coast is rugged and the interior mountainous or rich with tropical vegetation; the towns, too, old and new (most of them are both), are worth a visit. Haiphong is a thriving port, with rosy dreams for the future. Hanoi, since 1898 the capital of Indo-China, is in some ways perhaps the most attractive-looking spot for a residence in the Far East. It is a fresh, new city, prosperous and cheerful in appearance even though the stucco with which the buildings are covered soon becomes shabby and is often not as well kept up as it should be; but the broad streets are in perfect condition, there are good public buildings and handsome shops—indeed, it is hard to see who can support them all; the trees are numerous though still young; there is a fine botanical garden, pretty rides and drives, a theatre with a subsidized troupe (shared with Haiphong), a school of Oriental research, and other institutions of many kinds. Then, too, Hanoi has a real winter of a sort—for instance, driving on a November afternoon one may need an overcoat; so the climate is good as tropical climates go. None the less it is tropical, a fact not taken enough into account in the building of many of the houses, which are better suited to the suburbs of Paris than to Tonking. The native part of the town is quaint and bustling, though the few monuments of Annamite art in the vicinity are not striking. Altogether Hanoi makes a very favorable impression on the visitor. Whether its prosperity is factitious and due to too large an expenditure of public moneys, is a question on which the tourist should hardly venture an opinion, but there seem good grounds for being optimistic about the future of a capital situated in a fertile, thickly settled region, and the meeting-place of four railways.

Saigon is quite different from her younger rival. Though no longer the metropolis of the colony, she is the chief commercial centre, the port from which great and ever-increasing quantities of rice are shipped to many countries, including our own Philippines. The European city has an older, more established look than Hanoi. The trees are taller and more numerous, the theatre and Government buildings are finer; but, like Singapore, Saigon is hot all the year round, and, being built in the midst of a mud delta, offers no chance for an escape to a cooler neighborhood. There is a good deal of business done here, but, in spite of its trees and its theatre and its cafés, and its closer touch with the outside world, one would hardly choose Saigon as a home without some special reason. However, it repays coming to see for a day, and it is also the starting-point for an excursion to the ruins of Angkor.

Before saying anything about these wonderful remains, it may be worth while to point out that a visit to them, though entailing a little discomfort, is no longer a matter of real difficulty. There is a regular if not very good steamer which runs weekly in the season of high-water (from about November 15, to February 1) between Saigon and Sien Reap and Battambang in Siam, and the sail up and down has, in parts much charm. The ruins are just

within the Siamese border, but one should get a pass beforehand in Pnom Penh, the capital of Camhodia, from the French residency there, which telegraphs ahead how many visitors may be expected, so that there shall be enough sampans (native boats) to meet them. Pnom Penh itself is a rather attractive, bustling little place, with a puppet king and a new foreign quarter, adorned with the trees and fine roads the usual accompaniments of French rule; but its resources are soon exhausted, and one grudges the twenty-four hours spent there both going and coming. It is, however, a great convenience to those not provided with the necessary outfit, that the manager of the Grand Hotel furnishes not only food and bedding but servants and an interpreter for the further journey. In the very early morning of the followlng day the steamer reaches the mouth of the Sien Reap River, where one finds a sampan in waiting and is paddled up stream for five hours to the town of Sien Reap, and, after a further hour's drive by bullock-cart, reaches Angkor Wat. Here there is a very tolerable shelter in which the traveller can eat and sleep. If he is pressed for time, he can do his sight-seeing in two days, and then catch, on its return trlp from Battambang, the steamer by which he came. The whole trip from Saigon and back in this case takes about eight days; but it is much better, if one can afford it, to wait over a boat, see everything more thoroughly, and visit some of the less-frequented ruins.

Like the Bôrôboedor and other ruins in Java, the monumental remains at Angkor were the work of a race who must have been much superior in civilization to the natives of the same region at the present time. The temples at Angkor Wat and the palaces, some three miles beyond, at Angkor Thom, are only a part, though the finest part, of the ruins scattered over a district recently an integral portlon of Camhodia, of which Angkor was once the capital. The earliest work at Angkor Thom dates from the beginning of or perhaps from before the Christian era, while the latest at Angkor Wat is supposed to be of the eighth or even the tenth century. We can thus say that these buildings cover a period of at least a thousand years. They not only represent an enormous amount of human labor, such as can have heen performed only by a dense population in this now desolate region, they also show a very highly developed artistic quality, both in conception and in execution. As they stand to-day, they are undouhtedly entitled to a fo. emost place among the great monuments of the world. One must therefore deeply regret that more is not done to arrest the process of their further destruction by the ever encroaching tropical vegetation which tears them asunder, and also that further excavations are not undertaken which would doubtless hring to light much that is now hidden. Still, this would be a good deal to expect just yet of the Siamese Government on its distant frontier, but the desire of the French to restore to Cambodia—*i. e.*, get into their own hands—what has untll lately been the heart of her territory, ls not unnatural. What we know about these ruins is, of course, almost entirely the work of French scholars who have investigated and are still investlgating these remarkable products of an extinct civilization. Much as they have found, there is still a great deal to learn.

The dominant character of the art at Angkor is admlttedly Hindu. It is recorded that the Khmer, or Cambodian, state was founded hy an invasion or migration from India in the fifth century before Christ. The earlier inhabitants, the Ciampas, after some struggle, were suhdued or driven to the southward. The political as well as the artistic acme in the history of Cambodia seems to have been reached some fifteen centuries later, when hoth Siam and Annam were tributary to her. After that her decline was rapid. Her former vassals soon became her aggressive nelghhors, and then her overlords, who hetween them reduced her territory till what was left of it peaceably accepted a French protectorate ln 1864. The Indlan element in the population has prohahly long been suhmerged by the conquered race, and to this may ln a measure be ascribed the decline ln civilization whlch has taken place. It is true the modern Camhodians are a fine-looking, attractive people, even if lazy and hardly fit to hold their own in the struggle for existence against Siamese and Annamites, not to say Chinese. Camhodian art, with all its richness, is less elahorate than Indian; indeed, the traveller comlng from the more fantastic work of the Mongolian East is struck with its sohriety. The layman may hardly risk an oplnion on any resemblances to the art of other nations, such as have been suggested, but yet, even to the casual ohserver, the bas-reliefs (which differ not a little from one another) suggest the work of Assyria and Egypt; and at times the almost classical pillars make one think of Greece itself. As in the case of the pyramids, we have no knowledge how the huge blocks of stone were lifted to their lofty positions.

The temple of Angkor Wat is situated in a walled rectangular park 1,030 metres long by 830 metres wide. A stone bridge leads to the western or principal entrance, which consists of a central passage and two at the extreme sides (for chariots and elephants), piercing a gallery two hundred and fifty metres long and surmounted hy three towers. Ahout four hundred metres further, at the end of a broad highway flanked by some small ruins, is the maln building. It ls almost square, three stories in height, pyramidal in shape, and crowned by nlne towers, most of them well preserved, although the statues adornlng their exterior are in a bad state of decay. As the towers are in line with one another, it is difficult to see many of them at a time from the ordinary approach. The lower story of the temple is formed by a base, on which rests, on the four sides, a great gallery whose exterior pillars let in the light on more than half a kilometre of elaborate bas-rellefs (about two metres high), with thousands of figures representing scenes from the Ramayana and other examples of Hindu life and mythology. To quote from Sir Hugh Clifford's 'Further India':

"Even more astonishing than the Titanic character of the ruins is the wealth of beautiful detail which they display. Almost every individual stone is curlously carved. Statues of immense proportions, figures of Buddha, of giants and kings, of lions, dragons, and fabulous monsters, abound. The bas-reliefs show processions of warriors mounted on birds, on horses, tigers, elephants, and on legendary animals, combats between the king of the apes and the king of the angels, boats filled with long-bearded rowers, some of them dressed in the Chinese fashion, cock-fights, women at play with their little ones, soldiers armed with bows, with javelins, sabres, and halberts, and innumerable other scenes. The men who wrought these carvings must have been possessed by a veritable passion for artistic presentment, by a love of art for its own sake such as would seem to argue a degree of intellectual refinement which has no counterpart among the peoples of the Indo-Chinese peninsula in our own day."

The interior of the enclosure is now covered with rank vegetation, out of which, on each side of the main passage, there rises on a monumental base a detached building, a perfect little gem of architecture, reached hy a lofty staircase. Nine other exterior staircases lead from the first story to the second, but their object is chiefly structural. Even the one used for the actual approach is handsome rather than convenient. The second story itself is a smaller square gallery with cross connections, and, at a little lower level, four paved courtyards formerly containing fountains or statues. From the gallery we get many charming glimpses of different parts of the structure, across, above, below. The third story, reached by an even steeper staircase than the last, encloses the base of the central tower, a highly decorated sixteen-sided, tapering spire, whose summit, though it has lost the nine metres of its point, still looms fifty-six metres above the floor. From the platform there is a splendid view of the surrounding country, and we realize that this superb monument stands literally in the midst of almost impenetrable tropical jungle. The whole grand mass is of stone, and although one tower has fallen in completely and much of the exterior decoration has suffered from the ravages of time, nevertheless the temple as a whole is in a state of extraordinary preservation, for which one may well be thankful.

Unfortunately, this is far from being the case at Angkor Thom. Here we have not one building, but a number of them in an enclosure nearly four kilometres long in each direction, and entered by five great gates. The interior is a wild jungle, out of which here and there emerges the ruin of some once proud structure or crumbling wall. We are lost in astonishment at the really terrific power of the tropical vegetation. The seed in a crack becomes a tiny creeper, which expands till the force of its slow but resistless pressure splits mighty blocks of stone from one another; statues are entwined and pulled from their pedestals; trees have grown up as if by magic in what were paved courtyards, and have burst their way through thick walls. Even places cleaned up a few years ago are once more a mass of green. In its prime, Angkor Thom, with its palaces and temples and dwellings swarming with the brilliant life of an Oriental court, must have presented a gorgeous spectacle. A Chinese wri er of the thirteenth century, after the decline had already begun, has left us an account of the magnificence which he witnessed, and mentions that there were stalls for two thousand elephants alone. The chief buildings must have been most imposing. Ruinous as is their present condition, enough remains to establish their former splendor. The most interesting of them to-day is the Baïon, a great structure severely beautiful in its lines with three stories of galleries,

once surmounted by fifty solid towers, each of them with the colossal head of Brahma, whose four faces looked serenely down on the world below. Many of these towers have fallen, but others still stand, and in the midst of the desolation about them give an effect of grave majesty that is indescribable. Perhaps no one thing in the Angkor Wat itself quite equals the Baïon, and how much there is beside it!

It is hard to tear one's self away from sights such as this. To study them at all satisfactorily, even in a superficial manner, demands far more than two brief days, which are all that can be granted to them by the hasty traveller. However, even the merest tourist returns from his visit to Angkor with the feeling that he has been looking on wonders which he will never forget as long as he lives.

ARCHIBALD CARY COOLIDGE.

Correspondence.

ALL-ROUND CONSTITUTION-STRAINING.

TO THE EDITOR OF THE NATION:

SIR: In your notice of my *Atlantic* article on the United States Senate, you very fairly point to the President's recent manœuvres as a straining of Constitutional barriers quite as reprehensible as any proceedings of the Senate. When all is said, a thought will arise that the House of Representatives is not far behind either Senate or President in disregard of its real rights and duties, neglecting the latter and exaggerating the former beyond all bounds. The chief object of most members is to stand well with their constituents, so as to keep their seats; they are little scrupulous as to the means of effecting this end, and allow their relations to the President and Senate to take on all sorts of undignified and illegitimate forms.

In Mr. Cleveland's second term, the Democratic House, so largely controlled by Southern members, was intent on an early repeal of the so-called "Force Bill," or Federal Election Law. This repeal was sure, and while it was deferred there was no danger that the law would be operative. The President sent, not a public message, but private suggestions, to various members to let the repeal wait till some progress had been made with the tariff. One member greeted a note of this kind with the audible remark: "I wish the President would attend to his end of the Avenue, and let us attend to ours." Yet that member regularly laid siege to the White House "end of the Avenue"; he haunted the departments at all hours, demanding offices for his constituents to which he had no more constitutional claim than to the command of the army. WILLIAM EVERETT.

QUINCY, MASS., February 12, 1906.

PIGEON-HOLING EXTRAORDINARY.

TO THE EDITOR OF THE NATION:

SIR: Apropos of the alleged inefficiency of Government departments: there was received at this library on January 29, 1906, a document entitled 'A First Report on the Relations between Climates and Crops,' by Cleveland Abbe. The date of publication is 1905, the letter of transmittal to the Secretary of Agriculture is dated August 1, 1905. I expected to find in the document the results of recent investigation. My expectations were dashed as I read the second sentence of the letter of transmittal:

"This paper is not designed as an original investigation, but as a summary of the views of the best experimentalists and observers, *so far as those had been published up to 1891*. A continuation of this study, bringing the subject up to date, is contemplated, but as the publication of this first portion has been frequently requested, it seems wise not to delay."

Turning to the preface for further light, I read:

"[The chief signal officer] issued an instruction dated Feb. 25, 1891, authorizing me to prepare this work, completing it before June 30 of that year. The present report is a rapid compilation from a wide range of sources, and presents a preliminary view of the condition of our knowledge at that time, . . . I regret that the report could not have been published in 1891."

Where, then, was the manuscript in the fourteen years one month between its completion and its transmittal to the Secretary of Agriculture? Upon this mystery are we to have no light except that suggested by the regret quoted above?

A LIBRARIAN.

February 3, 1906.

MISSAL AND PAYNIMS.

TO THE EDITOR OF THE NATION:

SIR: The discussion of Keats's line has assuredly reached a stage that must be distressing to lovers of poetry. Why this needless expenditure of dialectic? To the imagination the clasped missal may be allowed to suggest holiness which the prayers of swart paynims neglect. We should be loath to disturb Madeline's blissful slumber with the creaking of our logic-engines.

LEWIS F. MOTT.

172 WEST 79TH ST., NEW YORK,
February 12, 1906.

Notes.

A new novel, by Owen Wister, 'Lady Baltimore,' is announced by Macmillan Company.

'The Fading of the Mayflower,' one hundred and fourteen stanzas in sonnet form, by Theodore Tilton, will be published March 1, by A. N. Marquis & Co., Chicago.

Dr. W. E. Griffis is at work upon a revision of his 'Mikado's Empire,' brought down to date by an account of the Russo-Japanese war. Messrs. Harper expect to have it in hand by mid-summer.

G. P. Putnam's Sons will soon publish the fourth and concluding volume of Dr. Morgan Dix's 'History of the Parish of Trinity Church,' and 'The Electoral System of the United States,' by J. Hampden Dougherty.

Marion Crawford, in conjunction with Count Soderini and Professor Clementi, is engaged in the preparation of a life of Leo XIII. on the basis of hitherto unpublished documents, which were personally handed over to Count Soderini by the late Pontiff. The work will fill four volumes, and, according to preliminary reports of those acquainted with the project, will put an altogether different face on the relation of the last two popes to the question of Italian unity.

Interested readers of the article on the new auxiliary language, "Esperanto," by Professor Schinz, in the last number of the *Atlantic*, will be glad of some information regarding text-books. There is a grammar and text-book by O'Connor (to be had of Fleming H. Revell Co., New York), an English-Esperanto dictionary by the same author, and an Esperanto-English dictionary by Matteau. A larger French-Esperanto dictionary (in two volumes of one thousand pages each) is in course of publication. With the building of the great wireless tower in the north of Germany, for communication with all the countries of Europe at once, the necessity for a common *Hilfsprache* becomes manifest. It may be mentioned that at least one American book, an elementary exposition of the modern theory of the continuum by Professor Huntington of Harvard, is about to be translated into Esperanto.

A few reprints deserve mention: the Oxford Edition of Kingsley's 'Westward Ho!' (H. Frowde), with illustrations from books and prints contemporary with the period of the Great Armada; by the same publisher (and, by chance, with an introduction by Walter Raleigh), the 'Lyrical Poems of William Blake,' the text controlled by Blake's latest and best editor, John Sampson—a tasteful volume for the hand; and Spenser's 'Faerie Queene' in two pocket volumes of the Newnes-Scribner Caxton Series, with limp orange covers and paper a shade too thin except for economizing bulk.

The new issue of 'Who's Who in America' (Chicago: A. N. Marquis & Co.) surpasses its English prototype by nearly 300 pages in extent, and is at once more exclusive (un-foreign) and more democratic if only by reason of its care for authors. The number of persons commemorated is 16,216, and for their addresses, when non-resident, they have been pursued to the uttermost parts of the globe. Of all directories, this is one most often to be thankful for and to resort to. Exemplary in its kind and scrupulously edited, it is, in addition to the biographies, the handiest tracer of a writer's (dated) works and publisher, and in this respect it enjoys a real distinction.

Mr. Frank Maclean's 'Henry Moore, R.A.,' in the "Masters of British Art" (London: Walter Scott; New York: Scribners), is a sound and unpretentious piece of work which will supply all the information that the general reader will care for about this thoroughly competent if not quite great painter. The illustrations are very successfully reproduced, and, in spite of the monotony of subject and the inevitable loss of the glory of color, give one a high opinion of the truth and vigor of Moore's rendering of the open sea, which he was one of the first artists to paint as an independent subject and without reliance on incident or "human interest" of any sort. The scattered allusions through the volume to Moore's brother Albert, whose talent was so different from his own, lead one to long for an equally good account of his life and work. Could not Mr. Maclean give it to us?

There is certainly, nowadays, a strong

leaning among English people of taste and leisure toward the study of old English furniture. In addition to the books we have recently noticed, all bearing upon this subject, and some of great cost and elaboration, we have now (from George Newnes and from Scribner) a less expensive book, 'An Introduction to Old English Furniture,' with a great many illustrations by H. M. Brock and text by W. E. Mallet, who says plainly that he is a dealer. This is so far from being an objection that one rather welcomes the appearance of a treatise written from the furniture-business point of view. Mr. Mallet very civilly calls attention to the most important of the other books upon the subject which are now in course of publication, and speaks as manfully as any collector could speak for purity of taste, for reason and moderation in the desires of the collector, for some independence of changing fashion, and for the consequent saving of fine old pieces from destructive alteration. The one hundred and sixty-eight examples are generally interesting. They are at least such pieces as a private citizen might hope to purchase, and embody designs of suggestive value. But the drawings are not very attractive; they are made with a broad-pointed pen in a too forcible style, leaving little chance for the more delicate details to manifest themselves. The author's brief notes which accompany them are to the point.

Four lectures delivered last year, by Prof. J. S. Nicholson, at the University of Cambridge, have been published under the title of 'Rates and Taxes as affecting Agriculture' (London: Swan Sonnenschein). A good survey of the pressure of taxes upon English landlords and farmers is based upon recent reports and memoranda of the Royal Commissions on Local Taxation and on Agricultural Depression. The author draws upon Dowell's 'History of Taxes' and upon Cannan's 'History of Local Rates' to prove that there is neither legal nor historical foundation for the popular idea that land has always been regarded as a peculiarly appropriate object of heavy taxation. On the contrary, only administrative difficulties have prevented land from enjoying special favors until very recently, when, curiously enough, the clamor for the taxation of unearned increment has come simultaneously with the almost total disappearance of true economic rent. Contending that agricultural rent in England is now simply profit on capital sunk in the land, Professor Nicholson argues against the presumption that the tenant is able to shift the tax upon the landlord. In reality, he claims, both parties share a heavy burden, for the rates are practically a fixed charge, while rent is declining and relief is at present arbitrary and inequitable. While the author proposes no definite scheme, he urges that the reform which must soon come, can be wisely accomplished only by complete reorganization of the whole system of local finance.

The term, "Poultry Farming," adopted by "Home Counties" for the volume published by Dutton, is a misnomer, so far as it implies extensive plants devoted exclusively to the breeding and rearing of domestic fowl. Its true title would be, "Avoid Poultry Farming." The author's purpose is to discourage poultry-raising on a large scale. Therein he shows sound common sense. He favors the system of poultry-keeping in vogue before megalomaniac notions had beset every kind of enterprise whereby a dollar might be earned. Thirty years ago, or even later, such a thing as a poultry farm was unknown. The output of eggs and fowl came from thousands of petty sources—from the twelve to fifty hens kept by country folks and allowed a wide range of territory, where, practically, they found their own living. "Home Counties" favors a return to this system, as a philanthropist eager to save his fellow-men from disaster. To those who may be lured to establish a poultry farm, with its equipment of incubators, brooders, wire-fencing, etc., 'Poultry Farming' may be cordially recommended as a deterrent. "Home Counties" has practical knowledge of his subject. He appears to fear the hostility of agricultural journals and dealers in poultry devices and supplies, by reason of his iconoclastic frankness. He certainly deserves grateful thanks of those who may not have learned the elusiveness of the nimble dollar in reproducing itself when subjected to artificial incubation.

The twenty-third annual Report of the Bureau of American Ethnology (for 1901-1902) contains, besides the usual administrative statement, an accompanying paper of unusual merit. Mrs. Matilda Coxe Stevenson writes of the Zuñi Indians, their Myths, Esoteric Societies, and Ceremonies. Having accompanied her husband in his many visits to the Zuñi region, Mrs. Stevenson has had a rare and extended opportunity for observation and for seizing upon the spirit of the local beliefs and ceremonies. Together with the general Report come Bulletins 28 and 29, of which the latter is a collection of Indian texts (Haida Texts and Myths, recorded by John R. Swanton), similar to those of Professor Boas already mentioned in these columns. Bulletin 28 originated in Mr. Charles P. Bowditch's interest in American archæology and kindred subjects. Feeling that American scholarship along these lines was hampered by the fact that so much relating to American antiquities was accessible only to the user of foreign languages, he supervised and paid for the translation of the twenty-four papers included in the present Bulletin. The collective title is 'Mexican and Central American Antiquities, Calendar Systems, and History,' the most prominent contributor being Édouard Seler. It seems hardly credible that there are many professional "Americanists" to whom German is a serious barrier; at the same time, we are glad to welcome the translation, especially as it carries with it a collection of material of high value from various sources.

The Carnegie Institution has put forth a classified catalogue of 'Writings on American History, 1903,' a bibliography of books and articles on United States history published in that year, "with some memoranda on other portions of America." The compilers are Andrew C. McLaughlin, William A. Slade, and Ernest D. Lewis. The books or articles are often accompanied by explanatory or appreciative notes, and by reference to leading reviews of them. An index mitigates the inevitable drawbacks of any system of classification.

From the Boston Book Co. we have a fifteen-page pamphlet of 'Abbreviations Used in Book Catalogues,' compiled by Mary Medlicott. A third of the space is given to a list of German technical terms of interest to librarians, mainly derived from the Pratt Institute Bulletin. The same firm sends us a corresponding brochure, 'Material for a Bibliography of Dr. Edmond Halley (1656-1752),' by Alexander J. Rudolph of the Newberry Library, Chicago. We should some time ago have acknowledged receipt of a second revised and enlarged edition of Señor Domingo Figarola-Caneda's 'Bibliografía de Rafael M. Merchán' (Havana, 1905). The compiler is the director of the Biblioteca Nacional, and his subject is an expatriated Cuban littérateur and publicist, whose fame is shared by Colombia, his adopted country. Sr. Figarola-Caneda furnishes a biographical introduction. Merchán was, like all Spanish-American writers, capable of verse as well as an acknowledged poet, but he translated Longfellow's "Evangeline" in prose (Bogotá, 1882). His 'Estudios Críticos' (1886) reprinted an obituary notice of Bryant contributed to a journal of the capital in 1878. The range of his interests was very wide, and is followed minutely by his bibliographer. Besides political and literary themes, he wrote on the education of women, and the last title in the pamphlet before us is a chart for guidance in the printing-office of *La Luz* with respect to purity of language, and for the simplification of typographic composition and correction.

In the initial number of volume eleven of the *Deutsche Juristen-Zeitung* (Berlin: Otto Liebmann) one may read a review of progress in the law for the past decade, accompanied by a very interesting plate of portraits of deceased jurists of the period; Mommsen the most famous of the twenty-eight. Dr. Zorn of Bonn treats of International Conferences, apropos of that now in session at Algeciras; but he does not refer to the American delegation.

Among the noteworthy indications of the intellectual awakening of China is the statement of three Bible societies, the British, Scotch, and American, that their circulation of the Scriptures in that country in 1904 was 2,308,109 copies. The significance of this is strengthened by the fact that the output does not represent mere charitable work, but the demand of the Chinese themselves. Of the more than one million copies circulated by the British and Foreign Bible Society, all but 33,273 were sold. Here we may also note the remarkable development of journalism in China. Shanghai, with a population only about two-thirds as great as Boston, has the same number of daily newspapers—nine, four of which are in the Chinese language. Hongkong, just half as large, has ten dailies, including six Chinese. In both places there are a large number of Chinese weeklies. Local dialectic newspapers are being started all over the Empire, and, according to Consul Anderson of Amoy, much of the anti-foreign agitation which has caused so much trouble of late is to be traced to such publications. In addition to these are many Chinese religious papers published by the missionary societies, which have large circulations and are forming an important factor in the regeneration of the educational and social system of the nation. Most of the foreign publications are in English, but there is a French daily and a German weekly at

Shanghai, and a Portuguese weekly at Hongkong.

—The 'Sailors' Narratives of Voyages along the New England Coast' published by Houghton, Mifflin & Co., and annotated by George Parker Winship, begins with Verrazzano's report to the King of France of his voyage in 1524, and includes the more familiar tales of Gosnold, Pring, Champlain, Waymuth, and John Smith, in chronological order. They are veritable sailor tales of slow voyaging over uncharted seas, anxious approach to unknown shores, and surprising and wonderful adventures of many kinds. These old sailors loved the marvellous, and were quick to believe any extravagant report. So they wrote fascinating tales of the genial climate, the fertile soil, rivers of excelling grandeur and beauty, great park-like groves, and mines of copper and iron, gold and silver. There was an exhilaration in the air of the New World that moved so sober and respectable a man as Pastor Higginson of Salem to write the highly spiced report of "divers thousands of acres of ground as good as need be, and not a tree in the same," and the light-minded Josselyn to tell of moose twelve feet high, with equal spread of antlers, and hens that crowed like cocks. This light-hearted joyousness is most beguiling. It implies happy and prosperous experience, and suggests that Bradford's mournful narrative of the Pilgrim Fathers' voyage and their pathetic first winter need never have been written had the pious Pilgrims been guided by the shrewd sailor wisdom of these men, and sailed from England not on September 6, but months earlier. But there is here also a large portion of sober truth-telling. These old navigators found the Indians a timid and peaceful race for the most part. They made free with their lands, traded craftily, and kidnapped their persons. The naïve story of "poor Christopher Levett" in 1624 bears eloquent witness to the wisdom of decent and Christian regard for them; the later tales of bloody Indian wars are the logical sequel. The editorial work has been skilfully done. The selection of material is judicious, with the single possible exception of the omission of any allusion to the voyages of the Northmen. Capt. John Smith's mention of "morish grasse" on Plum Island (p. 240) is unintelligible. Our own reading, "plaine marish," *i. e.*, marsh ground, is readily understood. Fine paper, large type, maps and facsimiles contribute to the charm of this delightful book.

—Sir George Otto Trevelyan's 'Interludes in Verse and Prose' (London: G. Bell & Sons; New York: Macmillan) is an echo from the past, the remote past of the fifties and sixties. On every page there is some allusion to the political or social interests of Londoners and Anglo-Indians and English University men of the day, and some of these interests proved to be so ephemeral that only a contemporary of the author could now do them justice. The parody of the "Ecclesiazousæ" of Aristophanes, for instance, called "Ladies in Parliament," was written in the period of agitation which followed the rejection of Gladstone's Reform Bill of 1866. Lord Russell had entertained John Bright at dinner, and this was the scandal of the London season to which there are witty allusions in the poem. One is thankful for the explanatory footnotes, and as one pores over the passing mention of men and things that mean little or nothing to the reader of to-day, one realizes anew how much political comedy depends on its freshness. If Sir George Trevelyan needs a schollast, how much of Aristophanes has become pointless forever? Two-thirds of the book are studies of Anglo-Indian life at a time when the rupee had not depreciated, and the writer could say that the career of an Indian civil servant held out the most certain and splendid prospects to ambition. Sir George's father was himself a model of a successful civil servant. But the son, in spite of his interest in Indian affairs, spent only one year in India, as secretary to his father on leaving college. His experiences followed close on the suppression of the Indian Mutiny, and he has written some thrilling pages describing the heroic resistance of a handful of English in the siege of Arrah, now long forgotten by the general public, for whom Cawnpore and Delhi are the classic allusions when the Mutiny is remembered at all.

—Perhaps the best paper in the collection is one which the author delivered as a lecture in Edinburgh in 1865, "An Ancient Greek War." He had promised to lecture on his travels in Greece, but an alarm of cholera checked him at Brindisi, and he substituted for personal experiences this admirable study, which could have been written only by a thorough Greek scholar. Towards the close he has some eloquent pages of panegyric on American valor in the civil war, just ended. "And to think," he says of Robert Gould Shaw and Charles Russell Lowell, "that the very existence of these men—our equals in birth, circumstances, and education—more fortunate than us in that they possessed a cause for which they had a right to labor and suffer—was successfully concealed from us home-staying youth! That we were almost brought to believe that a nation composed of descendants from the Royalist chivalry of the seventeenth century had been subjugated by a heterogeneous mob of aliens officered by political jobbers!" Sir George Trevelyan writing in the sixties, when all educated Englishmen were not so clear-sighted, found in the citizen armies of Sherman and Grant the closest modern parallel to the Athenian militia that fought at Chæronea. "Leonidas and his countrymen, performing their national toilette in preparation for the death which they knew to be inevitable, find a parallel among those veterans in Meade's army who, when their division was ordered on a desperate service, were observed to be silently writing their names upon slips of paper and pinning them to the breasts of their blouses." A fine tribute to Lowell's patriotic poetry closes this paper. The book is attractively printed and bound, and has an excellent portrait of the biographer of Lord Macaulay, taken in 1881.

—Volume eleven of the current 'Meyer's Konversations-Lexikon' (Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner) concludes the letter K from Kimpolung. In our English alphabet, K is not toothsome, but here it covers a large part of C, as maps not only of Königsberg but of Coblenz, Cologne, Constantinople, and Copenhagen testify. There are long articles on the Child, from kindergarten to juvenile education, songs, diseases, infanticide; and, in connection with one on infant mortality, a shaded map for the German Empire, the Bohemian border lying most in gloom, along with Stettin. The Church is another voluminous rubric. In treating of Colonies, maps are again employed, to show their extension the globe over, and there is a useful table of memorable dates in German colonization, coming down from 1528. As Kitchener's life is sketched without reflections on the Boer war, so Colombia's annals are summed up without characterizing the nature of her deprivation of Panama. Under the Congo State there is allusion to cruelties and oppression, with notice of Leopold's whitewashing committee. Korea is brought up to date and left "a vassal State." There is an odd immediate juxtaposition of Kuroki and Kuropatkin, the one born in 1844, his defeated antagonist in 1848. Which was the better man? On the principle of distinction in warfare, is Kuroki as civilized as Kuropatkin? We read their lives, and find the Russian to be author of a number of valuable military works; Kuroki's fame has no literary roots whatever. The kinematograph, comets, costumes, hospitals, atolls (in which Alexander Agassiz's researches counter to Darwin's theory are not overlooked), war, and art are other topics; while maps not yet named show the lighthouses of the German coast, and criminal statistics for Germany, France, and Italy. There is, finally, a series of portraits of German classics of the nineteenth century, of whom Kleist and Klopstock fall in this highly interesting section of the Lexikon.

—One of the most attractive biographies recently published in Germany is that of Johanna Schopenhauer, by Laura Frost (Berlin: Schwetsche & Sohn). It covers the period from her birth, in 1770, till her death, in 1838. Especially interesting is the record of her residence in Weimar, from 1806 to 1832. Soon after her arrival, Goethe called on her and introduced himself with jocose formality as the "Geheimrath Goethe." He had just married Christiane Vulpius, and thereby excited the anger of the aristocratic circles in Weimar, who refused to receive his wife or recognize her as "Geheimräthin." Frau Schopenhauer put aside this class prejudice with the facetious remark: "If Goethe gave her his name, we might at least give her a cup of tea." Goethe was grateful for this liberal spirit, and became a frequent and welcome guest at her receptions on Sunday and Thursday, where the presence also of Wieland, Falk, Fernow, Prince Pückler, Augustus and Frederick Schlegel, and other persons of distinction rendered her salon celebrated as the resort of the most eminent representatives of German literature and art at that time. She was remarkably cheerful in temperament and optimistic in her views of life, in striking contrast to her son, the misanthropic and pessimistic philosopher, Arthur Schopenhauer. This moral and intellectual antagonism prevented her from appreciating the real scope and value of his writings. When he took his doctor's degree at Jena in 1813, he gave her with justifiable pride a copy of his dissertation: "Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde." "The fourfold root," she ex-

claimed laughingly; "why, that must be something for apothecaries!" In a deeply injured tone he retorted: "My writings will be read when scarcely a copy of yours can be found in any lumber room." "No doubt," she answered, "the whole edition of your works will always be on hand." Curiously enough, both of these bantering prophecies were in a certain sense fulfilled. For twoscore years his works remained almost wholly unheeded, and scarcely found any sale except as waste paper, while his mother's twenty-six volumes containing chiefly works of fiction and descriptions of travel, although exceedingly popular during her lifetime, are now utterly ignored by the reading public, and actually unknown to the great majority of her countrymen. This is true even of her principal novel, 'Gabriele,' which Goethe speaks of having read with intense interest "in the forests of fir-trees at Marienbad." In 1814 the son demanded of his mother that she should no longer receive an old friend of the family, with whom he had quarrelled. Her refusal to do so led to a final rupture, and they never saw each other again during the remaining twenty-four years of her life. It is strange that a woman whose tact in social life surpassed that of the majority of her sex, should not have used this peculiar quality to prevent or at least to heal such a sad dissension. Her failure in this respect shows how deeply rooted was their mutual aversion.

REHABILITATING AN IDOL.

James Gillespie Blaine. By Edward Stanwood. (American Statesmen; Second Series). Boston: Houghton, Mifflin & Co. 1905.

"It would be uncandid on the part of the present writer were he to pretend that he possesses the impartiality and the passionless judgment that qualify him to make the final estimate of this man and of his career." These words of Mr. Stanwood, in his closing chapter, are fully borne out by the character of the book itself. We have here what must be characterized as the tribute of an affectionate friend, holding a brief for his subject in an appeal for a rehearing, before the rising generation, of certain cases in which an adverse verdict was rendered by the generation now passing from the stage. This marks at the outset a difference perhaps inevitable between the biographies of the former series and those of the men who have risen to prominence in American politics since the civil war. In the former case sufficient time has elapsed to allow of estimates fairly impartial and quite generally acceptable. Such is not the case with the men whose work has been begun and finished within a half-century or less, and especially is this true of James G. Blaine.

As Mr. Stanwood devotes his attention so largely to the effort to break the force of the well-known charges affecting Mr. Blaine's integrity of character, the critic is, of course, forced to consider whether the effort is successful. We may say at once that nothing new is brought forward to warrant any other fundamental interpretation of the admitted facts than that which was reluctantly accepted by many thousands of Blaine's own party friends when the facts were first made public. On the part of those who opposed his elevation to the Presidency after these disclosures were made, Mr. Stanwood imagines a personal animosity which did not exist. The persistent efforts to raise him to that office made it necessary that those who opposed should press their objections with all the vigor and steadfastness at their command, or fail to carry the majority of the people with them. Such failure, in their conscientious opinion, would have had an extremely bad influence on American politics. Such men as Curtis, Lowell, and Schurz were not moved by any personal rancor against Mr. Blaine, but they were deeply moved by the possibility that well-known blemishes in his conduct in high public station might be definitely stamped, by approval at the polls, as no bar to the Presidency of the United States. Mr. Stanwood devotes many pages to the Mulligan letters, but is obliged to say at the end: "No matter which of these views be taken, there will be none to dispute the fact that both the immediate and the remote consequences of his connection with the Little Rock enterprise were terribly out of proportion to any benefit he might have derived from it, had it been successful." But the men who ever afterward successfully held the revelations of these letters up as a bar against Mr. Blaine's progress to the Presidency, were not at all concerned with the financial largeness or littleness of the transactions involved. The lack of a fine sense of honor displayed both directly and by natural implication, all through the letters was what made the trouble. How much of the sensational story of Blaine's recovery of the letters from Mulligan's possession is true is wholly irrelevant, but no one can read them and not understand his intense desire to prevent their publication—a desire so intense as to defeat its own purpose by arousing such suspicion that he was obliged to publish them himself as the less of two evils.

In his suggestion to Fisher to remind Mr. Caldwell of a ruling from the Speaker's chair in favor of the Little Rock interests (the motive of the reminder being to secure a favor from Caldwell to Blaine), Mr. Stanwood finds it difficult to see anything reprehensible unless one is already prejudiced against Mr. Blaine. "The worst that can justly be said of his reference to the proceedings in Congress is well expressed by his own word, *indelicate*." But, granting the best that can be said, will it ever be wise to honor with the Presidency a man whose business correspondence while in high official position has such a fatal tendency to indelicacy? Mr. Stanwood appears to very serious disadvantage in his defence of the letter which Blaine wrote to Mr. Fisher, inclosing a draft of a letter which Fisher was to copy and mail to him, clearing him of any questionable action whatever in the whole Little Rock matter. "His sending a draft letter, and his request that the communication enclosing it should be destroyed, is not inconsistent with absolute innocence of wrong-doing, and can therefore not be used even as cumulative proof that he was guilty of wrong-doing." But the very use to which the letter itself was to be put was dishonest, for its desired effect depended absolutely on producing the utterly false impression that it was the purely voluntary act of Fisher. Mr. Stanwood is obliged to admit that this "voluntary" certificate of innocence, dictated to Mr. Fisher by the alleged culprit to be used in his own defence, omitted mention of circumstances which he wished to keep concealed from his investigators, and that such a statement as Fisher would have made if simply asked for his version of the affair would have been harmful. We do not believe that the time will ever come when a detailed defence of the transactions covered by the Mulligan letters will clear Mr. Blaine's reputation from serious reproach. The record was written with his own hand, and, so far as that part of his life is concerned, the verdict that he himself indirectly rendered by his passionate desire to keep the details of the matter from public scrutiny, will be the verdict of unbiassed posterity, so far as posterity takes the trouble to look at the evidence.

Many eminent men, however, have been subject to similar reproach, but have none the less rendered such transcendent services to their country and their fellow-citizens as to dwarf their temporary lapses practically out of existence by comparison. Is this true of Mr. Blaine? Was he, after all, one of the nation's really great statesmen, so that, after his biography shall have been written, as Senator Hoar suggests, "by a historian with a full and clear sense of his faults and infirmities, concealing nothing and extenuating nothing," we shall still feel that we have a great benefactor of our country, to whose career we may direct the attention of our boys with thankfulness and pride? Our mind turns here to the biography of Lincoln, by the general editor of the same series. What reader of those two notable volumes has not been forcibly struck with the way in which an overwhelmingly great character rises gradually up out of a mass of detail so adverse to our ordinary idea of the natural concomitants of greatness that we are tempted to wonder at times whether we are not reading the words of an intentional traducer? Will the final estimate of Blaine, which Mr. Stanwood has neither written nor seriously attempted to write, present even an approximate resemblance to this?

The question makes it necessary to consider briefly what he actually achieved, and what was the real source of his powerful hold upon the affections of so many men. His biographer admits that, of all the great questions at issue between the parties during his public life, "his name is inseparably connected with not one." But we must look beyond the domain of legislation, we are told. "Blaine's influence during his lifetime, and that which remains, was of a broader and more far-reaching character than can be measured by a consideration of the public acts in which he bore a part. It was an influence upon the general tendency of the political thought of his countrymen." This is vague, and, so far as Mr. Stanwood goes in the way of definite application, we can tie it down to little else than Blaine's early acceptance of some of the ideas underlying our present experiments with Imperialism. But sporadic Imperialists were in evidence long before the advent of Mr. Blaine, nor does it appear that the public mind was prepared for the outbreak of 1898 and its consequences by anything in his life or words. It is not yet determined that the launching of our ship of state on that particular sea will, in the unbiassed judgment

of the future, constitute any valid claim to greatness; but if it should, there are much less worthy characters than Mr. Blaine whose memories will be entitled to a larger share. Of the various lines of political thought rife in his time, that which so far has been the most fruitful was the desire for administrative reform in the conduct of our Government, which found its expression chiefly through the mouths of eminent Republicans who afterwards became his most effective opponents. What was his attitude toward that thought? We get it from his own lips, when he writes to President Garfield of "the Reformers by profession, noisy but not numerous, pharisaical but not practical, ambitious but not wise, pretentious but not powerful. They can be easily dealt with, and can be hitched to your Administration with ease." No biographer will ever be able to show for the writer of these words a genetic relation to the great reform movement which is the dominant feature in the political thought of to-day. On the tariff question, notwithstanding his dramatic interference in behalf of the addition of a reciprocity clause to the McKinley bill, we find no evidence of any such accession of fundamental enlightenment as came, though late, to McKinley himself. That the best thought of the day, in both parties, is surging rapidly forward to a successful grapple with the abuses of tariff taxation, is scarcely doubted even by the well-informed among the "stand-patters" themselves. In this movement no great positive influence will ever be traced to the career of Mr. Blaine. It is no prejudice, but the simple want of all evidence of any such positive achievement or influence as is necessary to substantiate a claim to real greatness, that must lead open-minded students of American history to reject the claim.

We have referred to his estimate of himself in the Little Rock transaction, as implied in his desire to suppress the evidence. Mr. Stanwood incidentally supplies us with another implied self-estimate. Of Butler's candidacy in 1884 Mr. Stanwood says, "His political career in Massachusetts showed that he could attract voters of a certain class who were to be found in both parties, and were a credit to neither." Of this vote Blaine wrote to Elkins, "If Butler runs, he will get 250,000 votes, more or less—less, probably. If he does not run, who will get a majority of those votes? I think I would, and hence would gain by his staying out." There is more sagacity here than in his imagining, at an earlier date, that he could command the support of the reformers.

His brilliant conversational power and engaging manner explain readily enough his ability to secure a firm hold upon most of his party associates with whom he came into personal contact, as well as upon many of his political opponents. His biographer gropes rather unsuccessfully for any adequate explanation of his hold upon the thousands of his almost frantically enthusiastic supporters with whom he never did come into personal contact. Perhaps it is well to remember that large classes of people occasionally do things, or display emotions, for which there really is no adequate explanation. The pages of history do not show that genuine greatness of statesmanship is prone to be the generator of wild enthusiasm. The student of Mr. Blaine's "popularity" will go astray if he does not consider carefully its abrupt limitations as well as its intensity. The significant fact was, that where men were most given to thinking outside the trammels of party dictation, there this wonderful popularity met with the most severe checks. In general, such popularity as admittedly great men have attained has run on lines almost opposite to this. Doubtless this seems a mystery to the thorough-going Blaine devotee, and with him we are content to leave it.

To many students of his career, Mr. Blaine appears at his best in his 'Twenty Years of Congress.' He can see the better traits in Jefferson's career far more clearly than many in whom blind partisanship is far less excusable, and his vigorous indictment of his own party for its course in the impeachment proceedings against President Johnson does him credit, especially when we remember that at the time he allowed the storm of party passion to sweep him off his feet along with the rest, and voted for the impeachment resolutions in the House. Mr. Stanwood's enthusiasm carries him beyond bounds, however, when he says that "No other book covering any period of American political history is so full and comprehensive, or displays such intimate knowledge of men and events." While we may admit Blaine's advantage in personal acquaintance with the men of whom he writes, to compare his volumes in point of fulness and comprehensiveness with the work of James Ford Rhodes, for instance, would be absurd.

Mr. Stanwood's attitude towards the leaders of the Independent movement against Blaine's candidacy for the Presidency is an interesting study. He is too intelligent an observer to take the more common position of the Blaine devotee that they were simply a coterie of wicked slanderers. He admits their high degree of intelligence and their thorough honesty of purpose. Blaine's own contempt for them he distinctly does not approve. He agrees with Senator Hoar, however, that the Independent is more severe upon those whom he supposes guilty of any serious delinquency than are the critics in the opposite party, and this seems to puzzle him as it did the Senator. If this be true, why should any one object? It is good Rooseveltian theory that a fiery vigor against all that is wrong in a political party is the best service which can be rendered to that party. The critics of the opposition party may be seeking mere partisan advantage, and are heavily handicapped by the natural suspicion of insincerity; the Independent, or the critic within the party, is much more apt to be moved by conscientious motives, and is therefore more earnest and more effective. Again, Mr. Stanwood lingers over the fact that most of the Independent leaders were free traders, and never again became regular adherents of the Republican party. He cannot accuse them of opposing Blaine because they were free traders, and yet—they were free traders. Why does he not open the window to which he stands so near and learn the truth that for many years how anything whatever that arouses independent political thought, has been working to the detriment of the high-tariff theory—that only the shackles of partisanship can keep its nominal defenders from deserting in such numbers as to make its capitulation a necessity?

In conclusion, we are forced to say that this book can hardly fail to harm the general series to which it belongs. From Mr. Stanwood's point of view, no one could have made a better presentation of his subject than he has made, but it is a point of view somewhat new to the "American Statesmen" series. It was perfectly allowable that this point of view should be presented, but an entirely independent presentation would have been preferable. If the series in question really needed a life of Blaine, it would have been better to select a biographer both presumably and really capable of entire personal detachment. The first group, closing with the civil war, made a very fair approximation to the acceptable "final estimate." It will certainly suffer if it is to be followed under the same general title by volumes partaking so largely either of ardent eulogy or of labored defence, and the more so when the two are united.

HISTORY OF ENGLISH PHILANTHROPY.

A History of English Philanthropy from the Dissolution of the Monasteries to the Taking of the First Census. By B. Kirkman Gray. London: P. S. King & Son. 1905.

Mr. Kirkman Gray has got hold of a fruitful idea, but he has not fully mastered it, and therefore has been unable to give it adequate expression. The original idea, which lends value to a treatise filled with information, is that English philanthropy has a distinct history of its own, and that the progress and development of philanthropic effort have been in England, as elsewhere, demonstrably connected with the development of thought. Our author has attempted to trace the connection in England between the humanity whereof the main object is to relieve or avert physical pain, and variations in public opinion. The existence of this connection is certain. The pity for suffering is in one sense, indeed, the same in all ages, though it is far more intense during some periods of human history than during others. But the form which this compassion takes and the methods by which it attempts to achieve its ends, vary infinitely, and this variation is always connected with the general beliefs, religious, moral, and social, prevalent in a given country at a given era. That this is so will in a general way be admitted by any one who has bestowed the least attention upon the connection between thought and action. But whoever will read with care Mr. Gray's treatise, will see at once that a conclusion which it is easy to arrive at on à-priori grounds, is established with certainty by an examination into the annals of English charity. At one time gifts to the poor, whether made during a man's lifetime or under his will after his death, had a two-fold object. They were meant partly to relieve the miseries of poverty, but in part also to lighten the purgatorial sufferings of the donor. Before the beginning of the seventeenth century, Englishmen had

ceased to believe in purgatory, and the sole object of gifts to the poor was the alleviation of earthly want.

Contrast, again, under the guidance of our author, the philanthropy which belonged to the age of Elizabeth and of the Stuarts, with the philanthropy which characterized the close of the seventeenth and the greater part of the eighteenth century. Benevolence during the earlier era was governed by the idea—very imperfectly carried out—that it was the function of the State to relieve or ward off distress. It is only recently that inquirers have realized that, for good or evil, the Privy Council, as the representative of the Crown, attempted under James I. and, till the outbreak of the Civil War, under his son to enforce the carrying out of the poor-law for the benefit, or at any rate the supposed benefit, of the poor. This effort, indeed, may be looked upon from very different points of view. It meets, as we gather from his tone, with the approval of Mr. Gray. It appears to a judicious inquirer such as Mr. T. Mackay, who still adheres to the faith of Bentham and of the reformers of 1834, to have been noxious, and in fact to have gone far towards the promotion of practices which by 1830 threatened the pauperization of the English laboring classes. Whichever be the right view, one thing is certain: the idea of State duty which prevailed during the sixteenth and until about the middle of the seventeenth century, succumbed before the very different beliefs which gained increasing force throughout the course of the eighteenth century.

Men did not grow less benevolent. The contemporaries of Johnson were a good deal more humane than the contemporaries of Elizabeth or of Charles I. No one can imagine that Johnson, enemy as he was of Dissenters, would have welcomed a law which sanctioned the cropping of a Nonconformist's ears. But whilst humanity had increased, the belief in State intervention had decreased. Charity had become rather a private than a Governmental concern, and Mr. Gray well calls attention to a circumstance which was at once the consequence, and also in part the cause, of this change of opinion. No one supposed that isolated individuals could give that aid to the poor or the sick which the State, in the case of the poor at any rate, attempted to provide in the form of poor-relief. But it was found that the joint-stock principle, which did such good work in the extension of trade, might also be applicable to philanthropic objects. The ideas of the counting-house (many of them, be it said, very sound ideas) were applied to the exercise of charity. There is no part of the 'History of English Philanthropy' so well worth reading as the chapters devoted to establishing, by an infinity of examples, the fact that societies for the founding of hospitals, for the relief of debtors, for the care of foundlings, for the erection of reformatories, penitentiaries, and an endless number of institutions supported by public subscriptions, gave effect to the constantly increasing humanity of the eighteenth century.

Let us look now at another example, provided by our author, of the relation between opinion and public benevolence. In a chapter entitled "Revolution: Thrift and Soup," he insists upon the peculiar characteristics of that school of philanthropists of whom one of the best known is Hannah More. Their distinguishing trait is that, while sharing the ardent humanity which was the glory of the eighteenth century, they participated to the full in the reaction which, on moral no less than on political grounds, condemned the French Revolution and its principles. They were at once fervent philanthropists and panic-stricken Tories. Hence a singular mixture of charity and fear. The men and women who devoted their lives to the service of the poor, were in constant dread of the alleged rights of the people. Their benevolence was undoubted, their teaching was often full of good sense, but their philanthropy savored of didacticism. Soup kitchens were connected with the distribution of tracts, and occasionally attendance at church was made the condition on which depended gifts of bread. In the case of individuals, and certainly of Hannah More, one may be certain that an enthusiastic desire to benefit the bodies no less than the souls of laboring men was the real source of devotion to their interests. But there is no need to deny that the religious public of 1790 or of 1800 considered both charity and religious teaching to be safeguards against revolutionary principles; the study of the Bible was the best antidote to the reading of Tom Paine's 'Age of Reason.' With the high virtues and the comparatively slight defects of these Tory philanthropists we need not here concern ourselves. All that must be noted is that the peculiarities marking a particular form of benevolence are clearly connected with the beliefs of a particular era. We may even go a step further than does Mr. Gray. We may assert a conclusion to which his whole treatise leads, but which he does not emphasize, that the exercise of philanthropy is merely one part, though a very important part, of social action, and, like legislation, with which it is intimately connected, is in reality always the result of dominant public opinion.

Here we see the one defect in Mr. Gray's treatment of a fruitful conception. He has not perceived its whole bearing; still less has he been able to give full expression to the idea of which his whole treatise is in reality the illustration. He is too much immersed in details. For the information he supplies about almshouses, hospitals, and the like, or about early attempts to realize in practice ideals which savor of Socialism, all readers may feel grateful. But the facts he unearths derive their real value from being illustrations of certain principles, or at any rate of certain states of opinion. Yet Mr. Gray never seems able fully to grasp the principles or conditions of belief which his facts illustrate. At all events, he shows very little power of bringing ideas into connection with history. A writer who purports to trace the course of philanthropy, cannot attain his end by merely providing us with a lot of useful information about the growth of different kinds of benevolent institutions. Still, though Mr. Gray has not in our judgment fully accomplished the object which he wished to attain, and has not marked with anything like sufficient clearness the essential and vital differences between the philanthropic ideas prevalent at different eras, his book may easily in this respect be improved in the later editions through which it is certain to pass. We have pleasure, then, in acknowledging that a work which suffers somewhat from not giving due prominence to one leading thought that ought to pervade every page of it, is yet full of facts and ideas which are preeminently suggestive. It is, for example, a great thing that the public should be made to realize that the attempt of the first two Stuarts to establish something very like political despotism, was closely connected with an administrative system meant to benefit the poor. It is not amiss that speculative admiration for Puritanism by men who would have loathed the tyranny of the saints, should be corrected by the knowledge that Puritanism, for a time, at any rate, checked rather than promoted philanthropy. It is a good thing for us all to learn that the prosaic labors of the eighteenth century laid the foundation for the mass of philanthropic associations which have, with all their defects, done much to mitigate the sufferings of the sick and the needy and have done still more to humanize the sentiments of the healthy and the rich Few things are more instructive than the way in which we can trace, through English history in the past, variations in the estimate of the relative merit of State intervention on the one hand, and of individual effort on the other. At a time when it appears pretty certain that new experiments in the direction of Socialism will be pressed or forced upon the English Parliament and the English people, it is of benefit to learn from the undoubted facts of history put forward by a writer who excels rather in the accumulation of information than in the enunciation of theories, that neither the ideas of Socialism nor the problems which they are intended to meet are new, and that in England these problems have been partially met by exerting the powers of the State, but still more frequently by the combined efforts of individuals. A history of English philanthropy in the past affords some, though perhaps rather dubious, guidance to a generaton of Englishmen who seek to determine what in the immediate future shall be the patb of philanthropic effort.

The Abolitionists: Together with Personal Memories of the Struggle for Human Rights, 1830-64. By John F. Hume. Putnams. 1905.

The author of this weighty and dispassionate little essay might have adopted for its epigraph the verse of the protagonist in the great conflict—

> "I am an Abolitionist!
> I glory in the name."

His text is a passage from Theodore Roosevelt's biography of Benton in the American Statesmen series, twenty years ago, condemnatory alike of the Abolitionists proper —the purely moral agitators—and of the Liberty party, the political seceders from the former body. Mr. Roosevelt approves of nothing back of the Republican party. The Abolitionists "have been credited with deeds done by other men whom, in reality, they hampered and opposed rather than aided." After 1840, "much of what they did was positively harmful to the cause for which they were fighting." "The Liberty party, in running Birney, simply committed a political crime, evil in almost all its consequences. They in no sense paved the way for the Republican party, or helped

forward the anti-slavery cause, or hurt the existing organizations. . . . Lincoln in 1860 occupied more nearly the ground held by Clay than that held by Birney. . . . The Liberty party was not in any sense the precursor of the Republican party, which was based as much on expediency as on abstract right, and was therefore able to accomplish good instead of harm."

Mr. Hume, an Ohioan by origin, of legal training, the political editor of the *Missouri Democrat* on the eve of and during the civil war, has felt Mr. Roosevelt's utter want of sympathy with the Abolitionists, and has been moved to recall and vindicate their noble and disinterested and self-sacrificing labors. He further insists upon a genetic relation between the Liberty party and the Republican party. His criticism is agreeably interspersed with personal reminiscences, and his work is a salutary recall of thoughtful minds to a first-hand study of the actors in the mighty moral drama of 1830-1865. He uses the term Abolitionists too loosely, indeed—almost as loosely as the lords of the lash themselves, who knew no distinction between the anti-slavery sentiment of Garrison, Birney, and Lincoln—anathema all. And in his main thesis he is far from exhausting the subject of the evolution of political anti-slavery organization. He comes nearer to sharp definition in chapter xix., "The End of Abolitionism" (p. 150):

"The original and distinctive Abolition movement that was directed against slavery in all parts of the land without regard to State or Territorial lines, and because it was assumed to be wrong in principle and practice, may be said, so far as the country at large was concerned, to have culminated at the advent of the Republican party. To a considerable extent it disappeared, but its disappearance was that of one stream flowing into or united with another. The union of the two currents extended, but did not intensify, the Anti-Slavery sentiment of the country. It diluted it and really weakened it. It brought about a crisis of great peril to the cause of Anti-Slaveryism—in some respects the most critical through which it was called upon to pass. Many of those attaching themselves to the Republican party . . . were not in sympathy with the Abolitionists. They were utterly opposed to immediate emancipation; or, for that matter, to emancipation of any kind. They wanted slavery to remain where it was, and were perfectly willing that it should be undisturbed. . . . One of these men was Abraham Lincoln, whom I heard declare in his debate with Douglas at Alton, Illinois: 'I was with the Old-Line Whigs from the origin to the end of their party.' The Whigs were never an Anti-Slavery party. . . . These men largely dominated the new party. They generally dictated its platforms, which, compared with earlier Abolition utterances, were extremely timid, and they had much to do with making party nominations."

This is perfectly just, as any one may perceive who reverts to the party's attitude towards compromise and the Peace Congress in January, 1861. But the Liberty party is chargeable with a corresponding defection from and limitation of the aims of the Abolitionists proper. In 1847 Wendell Phillips wrote to an English correspondent:

"Our old enemy, Liberty Party, is fulfilling, oh, how exactly! our prophecies in 1840. . . . We said she would be obliged to adopt more than one principle (hatred to slavery) before she would increase. Lo! Goodell and all New York have confessed it, and joined the Democrats on Free Trade, the Land Reformers on Land Limitation, etc., etc.—19 points in all. . . . It was prophesied that the party would be obliged to desert its main principle, separate organization, in any real anti-slavery struggle. It did so in the only two it has met—in New York, on the Constitution [of 1846]; in New Hampshire, on J. P. Hale's election. It was prophesied that when pressed it would be forced to gain strength by selecting for candidates men not of their party. Leavitt, desirous to equal Goodell, is about to select Hale as their Presidential candidate—a man never of their party. It was prophesied that so fast as men became politicians, they would cease to be frank-spoken, active reformers; and so it has proved. Liberty party, *as such*, is dying, and merging under other names in other movements."

In its inception the Liberty party, though exchanging a concrete for an abstract denomination, professed no other aim than its members had pursued as Immediate Abolitionists—an aggressive policy of emancipation, but through political agencies. The Free Soil party was already shrunken and on the defensive, as its name showed: its chief concern was to stop the extension of slavery. The Republican party chose a neutral name, and was ready to go to the lowest depths of concession in order to avert civil war. It was the residuum of successive sheddings of the pure faith expounded in the *Liberator*.

We can dilate no further on this topic, and as to others we must refer our readers to the book itself, which deserves the widest circulation and calm pondering. We conclude with a few unconnected pregnant extracts:

"The slave-owners were numerically a lean minority even in the South, but their mastery over their fellow-citizens was absolute. Nor was there any mystery about it. As the owners of four million slaves, on an average worth not far from five hundred dollars each, they formed the greatest industrial combination—what at this time we should call a Trust—ever known to this or any other country" (p. 32).

"And what has the political party which, in view of its manifold professions, was supposed to have the interests of the negro in its especial keeping, done about it [disfranchisement since the war]? Nothing whatever. It has looked on with the coolest indifference" (p. 81).

"It used to be our boast that Freedom followed our flag. Now slavery [in the Philippines] follows it" (p. 84).

"On all questions affecting human liberty, no one can fail to observe that the attitude of the two great political parties of to-day is practically that of the two principal parties at the time the Abolitionists began their operations. One of them may pass perfunctory resolutions against the Philippine crime, but dares to say nothing about the treatment visited upon the negro. The other may say a few compassionate, but meaningless, words for the negro, but cannot denounce the oppression of the Filipinos. Both are fatally handicapped by their connections and committals. Both are, in fact, pro-slavery, although the one in power, because of its responsibility for existing conditions, is the more criminal of the two" (p. 86).

"If a stranger who knew nothing of the speakers [Lincoln and Douglas at Alton in 1858] and their party associations had heard the two men on that occasion, he would have concluded that one was strongly in favor of slavery and the other was not opposed to it" (p. 96).

"Had the Rebels been shrewd enough, within the hundred days [following the Emancipation Proclamation], to take the President at his word, he would have stood pledged to maintain their institution; and his proclamation, instead of being a charter of freedom, would have been a license for slaveholding" (p. 138).

"Notwithstanding various unfriendly references of an academic sort to that institution, he [Lincoln] was not at the time the proclamation appeared, and never had been, an Abolitionist" (p. 139).

"The conclusion is inevitable that his [Lincoln's] fame as a statesman will ultimately depend less upon his treatment of the slavery issue than upon any other part of his public administration" (p. 147).

The two authoritative chapters on Missouri, written from inside knowledge, are of great importance to the historian, and are especially not to be neglected by any future biographer of Lincoln. We stay our pen with the remark that such a defence as this of the Abolitionists curiously gives no certain evidence of the author's ever having read the history *par excellence* of that body.

English Domestic Architecture of the XVIIth and XVIIIth Centuries: A Selection of Examples of Smaller Buildings, Measured, Drawn, and Photographed, with an Introduction and Notes, by Horace Field and Michael Bunney. London: George Bell & Sons; New York: The Macmillan Co. 1905. Quarto, pp. xiv., 76; many text illustrations and 118 plates.

The authors of this book express, at the outset, their wish to deal with the smaller dwellings of the epoch from the middle of the seventeenth century to the middle of the eighteenth century, or thereabout. They point out how the "English Renaissance," as they call it, has been dealt with of late rather fully, and mention their own dealings with the "less important buildings of this time" as having been undertaken especially to complete the needed investigation. They say that they hope to interest those who know the work of the period, as well as "many others who have never studied it and are therefore ignorant of [its] simple and dignified character." Those are safe words to use, but they are also just and sufficient words. It is a speciality of English architecture that it compares with that of the Continent as the small and unpretending compares with the stately. It has the faults of a cheap and simple fashion of building, but it has its virtues, too, and virtues which appeal very strongly to the modern and to the American taste as regards external architecture. It is truly "simple and dignified" in spite of its small scale and inexpensive treatment. The English cathedral is not high in the ridge, broad in the nave, and yet of overwhelming altitude within in proportion to the width of the nave. It is not mysterious nor bewildering nor overwhelming: and in like manner the English mansion house does not rival a royal palace in its method of design, as do so many châteaus of the sixteenth, and so many of the nineteenth, century. So with the smaller houses as they are discussed in this book: one of the more important of them is the newer wing of Castleton Hall, near Rochdale, Lancashire, with five windows in each story, two full stories, and a row of dormers in the roof. Of this it is said that the material was "little sympathetic to the refined mouldings and accurate masonry which Renaissance architecture required. . . . The local sandstone has been used for the walling, and the dressings made out of millstone grit, as has always been the case." The large scale of the building is commented on; and by this is meant that the win-

dows of the ground story are 11 feet high and 5 feet wide in the clear, and the whole height of the two-storied wall 29 feet above the base course—not a very palatial scale, after all!

We quarrel with our authors very often for their neglect to tell us about the material; but no one who knows the moderate-sized English house, new or old, will believe that these big modillions of Castleton Hall and the cornice they carry are of any material other than wood. If they are of wood, though, should not the authors of the excellent introduction, with its sagacious remarks about sincerity in design, have mentioned the fact to regret it? For assuredly this is a stone mason's idea; these cornices are based upon stone building, they are copied from the cut-stone architecture of the Continent. So that here in this very example the merit and the less acceptable character of English work are at once fairly set forth; indeed, English cheapness of structure and simplicity of aim have never been found quite apart from forgeries of the sort here suggested, with carpenter work and plaster work doing duty for cut stone.

The building named above is given us only in an elevation with some details (Pl. xxi.). There are, however, many photographic plates, some showing each one large building, three or four having two or even three buildings apiece in little separate pictures. The last plate of all arrays four doorways of interesting character, chosen in four little old towns whose very names are like a journey in the Midlands and thence to the South coast—Warminster, Painswick, Stanford, Dingley, and Chichester.

One marked feature is the presence, among the photographs, of views in the streets of towns. These are pretty and make one long to go and live in them or opposite to them. "A house near the church, Painswick, Glos." is the subject of Plate x. "Samuel Salter's house, Trowbridge, Wilts," occupies Plate xv., and has in Plate xvi. a line drawing, an elevation of its front. Plate xxiv. represents "The Ship, a commercial hotel at Mere, Wilts"; and here both sides of the street are seen as it goes curving away, affording by its layout a good opportunity for the camera. All these and the five-score buildings, more or less, which come into the scope of the book, are treated with the briefest possible verbal description. The short notices are devoted almost wholly to comments upon the material; and if any word about the design is ventured, it is a word and little more. There is, however, an excellent Introduction of eight pages, a chapter of nineteen pages dealing with "The Renaissance Evolution in England," and a preliminary essay on the illustrations, preceding the separate notes devoted to them. The matter of this text is perfectly well thought out and expressed. The book is a valuable one from every point of view.

India and the Apostle Thomas: An Inquiry. With a Critical Analysis of the 'Acta Thomæ.' By A. E. Medlycott, Bishop of Tricomia. London: David Nutt. 1905.

Conducted in a scholarly spirit, temperate in tone, and with full references to authorities, Bishop Medlycott's fresh investigation of the vexed question regarding St. Thomas's work in India will be welcomed by all Church historians. It is impossible to give detailed arguments here, but a brief statement of the various theses maintained in this book will be of interest. St. Thomas made two distinct expeditions to India. The first was to the Indo-Parthian frontier. After being summoned back to the place where the Virgin Mary was about to die, he undertook another mission to south-western India, whence he went to the Coromandel coast. There, near Madras, he founded a church which survived for several centuries, until the persecuted disciples fled to the western settlement. The Saint's remains were transferred to Edessa between the years 202-241. Calamina, where the Saint died, is a foreign form of Kâlâh [Khalam, Colon], *elmina* (port), 'Qualah-the-harbor.' After the seventh century this name took the place in Occidental recitals of the real name of the little town now called San Thomé, but originally Mylapore (Ptolemy's Mallarpha). Calamina has nothing to do with south Persian Karmân, as maintained by W. R. Philipps. St. Thomas's sojourn in Southern India is inferentially proved by testimony of the fourth and sixth centuries. St. Pantænus (the rival "first apostle to India") was never in India! The Thomas who was a disciple of Menes was not in India at all, as Theodoret asserts, but in Syria (Judæa) as affirmed by still older tradition. We believe the bishop to be right in this.

Historians of India will wonder, however, at some of these positions. Mr. Vincent Smith, whose 'Early History of India' was published last year, holds that while St. Thomas's mission to Parthia is credible, the connection with South India is a late Nestorian invention, without older authority than that of Marco Polo (thirteenth century). Bishop Medlycott now shows that Theophilus (fourth century) probably visited India and found a Hindu colony of Christians. Again, in the sixth century, the Theodore cited by the Bishop of Tours saw a Christian church, a monastery, and a church festival under conditions reconcilable only with the climate of South India. Bishop Medlycott decidedly scores when he says that Calamina could not have been Karmân, or the local Nestorians would have had the legend of St. Thomas's martyrdom. His own etymology, though, seems too fanciful to be true.

St. Thomas is a picturesque figure. Not content with India, he converted Ethiopia and several other parts of the earth. The best description of his mission is given in the 'Acta Thomæ.' He was not at all inclined to accept the service which Christ bade him undertake. "Whithersoever thou wilt, O Lord," he said, "send me; only to India *I will not go*"! Finally, however, he went, pretending to be an architect, since Gondophares, King of Parthia, had sent for some one to build him a palace, and this seemed to be a good opening. The Saint spent all the money received for building the palace on the poor; then, when the day of reckoning came and the King asked where his palace was, he replied, "I have built you a palace—in heaven." Bishop Medlycott supposes that after this the Saint went to Socotra, passed from there to the mainland, and so eventually reached the eastern coast. Tradition certainly has it that the savages of Socotra centuries later claimed to be descendants of the Saint's first disciples, and who can disprove the tradition? As for the rest, it is not at all improbable that the legend of the Southern mission is much older than the thirteenth century. If the 'Acta' revert to the second century, some mission to India has that respectable antiquity: but the 'Acta' are not in their original form, and details of description found therein may not be of so great value as Bishop Medlycott opines. If, however, the Saint himself—who bears to India somewhat the relation that St. Patrick bears to Ireland, the little matter of snakes excepted—takes any interest in the matter, he will have the Bishop of Tricomia to thank for the ablest presentation yet made in favor of the famous mission to Southern India.

The Bishop's book gives an excellent résumé of the whole discussion and contains a store of documents not easily accessible. In his analysis of the 'Acta' and criticism of (Ptolemy's Maliarpha in) McCrindle's 'Ancient India,' the author's philological skill is worthily employed. A map showing the various routes followed by the apostle would have been of service to the general reader, who would probably be interested also in a list of the radically different languages—Semitic, Aryan, Dravidian, Ethiopic—and dialects which the Saint must have employed on his various tours.

Round About My Peking Garden. By Mrs. Archibald Little. Philadelphia: J. B. Lippincott Co. 1905.

Archibald Little, whose recent work on China, economic and physiographic, was recently reviewed in this journal, and his wife deserve the hearty thanks of all who would understand the Chinese as human beings like ourselves. The Chinaman of seventeenth-century French fancy, the ogre of the British opium-seller, the creature imagined by sand-lots orators, and the bogy dreamed of by land-hungry Emperors is a phantasy of one sort. The actual product in humanity of ages of peculiar physical and mental environment is a reality worthy of study. It is to the credit of Mr. Little that, after forty-five years of honorable activity in China, he has been able to picture a land and people with insight, sympathy and justice, while for twenty years his wife has been a helpmeet for him. Educated by her father, and rich in experiences of every sort in China, she has labored, possibly more than any other one woman, at the task of bringing into accord of mutual helpfulness the womanhood of China and of Christendom, and her works praise her in the gates. Behind this book about flowers, architecture, and travel, there is a notable personality. At the outset, one can see that the volume has not been put together, as is so often sadly the case, in some book-manufacturer's office, and illustrated with such material as the clerks and salesmen of the house might pick out from a miscellaneous collection of photographs bought in shops. More than four-score illustrations, here rendered with accuracy and spirit, show the author's own taste and skill in selection, she choosing the subjects outdoors and indoors, and handling her own apparatus. Hence the mass of delightful and edifying illustration,

which powerfully reinforces the text, giving even a *blasé* reader fresh impressions, as of a new China, discoverable only by sympathetic eyes, while yet as realistic as sun-pictures make it. Even when stock subjects are touched by her pen or camera, the effect is that of a discovery.

Instead of a preface, Mrs. Little gives us an introduction entitled "Peking Revisited: An Anniversary Study of August, 1900." Vividly photographing, in word and picture, that awful carnival of loot and devastation, as well as the belated supremacy of discipline, Mrs. Little handsomely appraises, discerns, and lauds the efforts of civilized officers to restrain the outbursts of elemental passions. She is optimistic, though not as the fool, about the promised good to come, at least in the twenty-first century. She saw the Court come back, and her opinion is fixed about the Empress Dowager, as a woman who has an iron will, with abundant resources of mental strength. Very pleasantly does she chat about Pekinese dogs of rare breed, and tell of goldfishes with telescopic eyes and triple, lace-like tails. She takes us where the Great Wall dips its mighty toe into the sea, and gossips about seaside resorts; then to the Imperial Hot Springs and the Ming tombs, and further to Kalgan and the Mongolian grass land, and comes back again to Peking palaces to tell us about Lama and Confucian temples, with others of many sorts and varieties. There seems to be something like a permanent Congress of Religions in Peking, but there is nothing under Government patronage but Confucianism. Examination halls and the ways of students are also treated of with sprightliness, with a chapter on the soldiers of five nations in China, her criticisms being both original and quoted. She mourns that her English brethren, so apt to follow in old ruts, are so slow to learn new things, though she does not admire the Germans. Of the American soldier she says: "The man is equal to his officer, and speaks to him as such. His needs are so great that the commissariat stores are a miniature army and navy cooperative; and it is impossible to move them far or quickly." A visit to Port Arthur shows how it looked before the devastations of war. Dalny, the fiat city, morass of finance and edifice of graft, with its harlequin architecture, is also described. On the missionary question, Mrs. Little's judgment is not that of a closet critic or hasty tourist. She speaks with a knowledge not born of the club or hong, but of the long-resident traveller and level-headed coöperator with those who, whether lay or clerical, "live in pulses stirred to generosity, . . . in scorn for miserable aims that end with self."

There is an index and a glossary.

The Farce of Master Pierre Patelin. Composed by an Unknown Author about 1469 A. D. Englished by Richard Holbrook. Boston: Houghton, Mifflin & Co. 1905.

At length, after near 450 years of waiting, this little masterpiece appears for the first time in an English dress. Mr. S. F. G. Whitaker, it is true, has recently published an English "Patelin," but his version was taken from the "faked" and transformed text of the Abbé Brueys. Mr. Holbrook's version is from the genuine text as given in the earliest printed edition, that of 1486, but a few years later than its composition.

The title follows the French editions in calling "Patelin" a "farce"; but really it is an exquisite little bourgeois comedy. There is nothing of the farce proper about it—no exaggeration nor grimace; the personages, though comic, may very well have been drawn from the life. The perfection of the simple plot, the ease of the handling, the crispness and neatness of the dialogue, show the literary artist; and we can hardly charge Fournier with exaggeration when he calls it "l'œuvre capitale de notre théâtre comique avant Molière." Though it seems to have enjoyed great popularity from the time of its appearance, the author is unknown. He was evidently one familiar with the law courts, and was most probably one of the clerks of the Basoche, who had almost a monopoly of the comic drama in the fifteenth century. It was almost certainly written in Paris, though the scene is laid in some provincial town not specified. From the "pawkiness" of the shepherd, we should conjecture Normandy.

The translator has well accomplished a difficult task: difficult not merely on account of obscurities of phrase and allusion, but from the necessity of reproducing the ease and sprightliness of the dialogue without losing the antique color. Idioms—many of which would be unintelligible if literally translated—he has tried to represent by idioms; as, for example, *avocat dessoubz l'orme* by "briefless barrister." But when he renders a fifteenth-century phrase by the most modern slang: for instance, *Dieu en soit loué*, by "Now you're talking"; *Il luy faut or—on le luy fourre*, by "He must have gold: he shall get it—in the sweet by and by"; *Dictes, je vous pry, sans sorner*, by "I say; please, no kidding"; *Par le sang bleu!* by "Great guns!"—one is conscious of something like a jar.

The edition is enriched by the spirited woodcuts of Pierre Levet (1490) and by a description of the stage-setting adopted at the Comédie-Française. If the translator had given the French text in an appendix, it would have been a boon to students; but we are very thankful for the book as it is.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 22, 1906.

The Week.

While the full scope and effect of the decision of the Supreme Court on Monday, in the Chesapeake and Ohio case, cannot be gathered from the fragmentary press reports, some things are clear. One is that the courts may be depended upon, in the end, to brush aside the fictions by which corporations attempt to evade the plain intent of the law. This is the outstanding feature of Justice White's opinion. A railroad cannot be, now a carrier, now a dealer. It cannot do as a dealer what it is forbidden to do as a carrier. The word "indirectly" in the Interstate Commerce act takes off the cover from a multitude of sins—such as that by which the Chesapeake and Ohio sought to give itself, as dealer, a lower rate on coal than it would give to any other dealer. Once a carrier, always a carrier, says the court, and with all the obligations of a carrier to obey the law. This decision should also serve to remind Congress and the President how great are the resources of existing law, and how vast the powers of the courts which may be invoked to protect the property rights of the people. One would say, too, that this latest decision of the Supreme Court ought to strengthen the hands of those who are contending for an amendment to the Hepburn bill of a sort clearly to establish the right of judicial review.

If the Ship Subsidy bill had a chance of passing the House, it would not have passed the Senate. It is so perfectly understood that Speaker Cannon and the House leaders will not touch it, that the Senate felt it safe, after a perfunctory debate, to let it come to a vote on February 14. It is a bad bill, so vicious in some of its features that five Republican Senators refused to vote for this party measure; but almost worse than the bill itself is this reprehensible way of playing fast and loose with legislation. One year the House passes a bill which it knows the Senate will kill; next year it is the Senate's turn. Senator Gallinger and his fellows will now say to the ship-owners that they have kept their promises and paid the party debt, and that the trouble is all with a parsimonious House. But every one knows that a Republican bill which is so glaringly improper that Senator Spooner would not vote for it, had from the first no hope of getting through the House.

"Bravo! John Chinaman," says the Lahore *Panjabee;* "you have fairly brought the go-ahead, pushful, and creation-licking Yankee from his high perch." The remark is in connection with the anti-American boycott, which, as the House Committee on Foreign Affairs was told on Thursday by Mr. Denby, ex-Secretary of Legation at Pekin, was directly provoked by our Chinese exclusion laws. Even in Singapore, which is not a part of the Chinese Empire, though a majority of its inhabitants are Chinamen, the boycott is so extensive and stringent that the new street-car company found it advisable to distribute thousands of handbills in Chinese declaring that "nothing belonging to the tramway—rails, cars, screws —was made in America." Small wonder that, with such a feeling, the Pacific Mail Steamship Company should report that American trade with China is "practically gone." Much good a ship subsidy would do in such a case! The plain fact is, that we have gone blindly ahead in our dealings with the Chinese as if they had not the ordinary attributes of human beings. We thought that we could cut them and they would not bleed, could wrong them and they would not revenge. We are finding our mistake.

Only 87 Congressmen were willing on Thursday to consider a bill for abolishing or consolidating the custom-houses operated at a loss, while 163 resolutely stood by these venerable and costly institutions. It is a measure which has come up a great many times in the past, and will doubtless continue to come up in the future until Representatives are willing to put the interest of the nation and its revenues above local pride in having a custom-house. The way in which the unprofitable ports are scattered geographically makes their abolition an uncommonly difficult business. Though there are only fifty-one of them, they are distributed over twenty-four States, whose delegations, voting together, could defeat any legislation. Maine has eight, and a member from that State, Mr. Reed, threw the proposed reform out of court many years ago. Massachusetts stands next with five, and a Massachusetts member, Mr. Gardner, made the point of order which put over a bill unanimously reported by the Ways and Means Committee earlier in the present session. The relation between the vote and the map would not be hard to trace. The Government maintains collectors at ten ports where, with expenses of $5,160.33, not a single dollar was collected in the last fiscal year. It cost $321.38 to collect every dollar of revenue at Albemarle, N. C., $200.22 at Cherrystone, Va., $185.88 at Annapolis, Md., $125.04 at Tappahannock, Va., and $101.46 at York, Me. The system is ridiculous in theory and in practice. The only hope is that, as Congress in the past consented to have the collection of internal revenue put on a business basis, it may ultimately make the same concession for the customs.

The bill of Representative Adams of Pennsylvania, providing as punishment for wife-beaters in the District of Columbia "lashes not exceeding thirty, by means of a whip or lash of suitable proportions and strength for the purpose of this act," has been a cherished measure of his, as he declared last session, for the past twenty-three years. Last year, during the debate on the Fortifications bill, he interpolated an extremely weighty ten-column speech, reviewing the legal status of women from the time of the Egyptians down, and embellished by a statistical table showing the number of Pennsylvanians who beat their wives annually, and the nature of the punishment meted out to each. This year the Committee on the District of Columbia was persuaded to report the bill without recommendations, and the House, on the day when it resolves itself into a local Board of Aldermen, attacked it with much gusto. Mr. Adams referred to the words of the President of the United States in his message for 1904: "Probably some form of corporal punishment would be the most adequate means of meeting this kind of crime." Whipping is not the only form of corporal punishment yet devised. Members were not content to stop short with that, or with inflicting bodily suffering for only one crime. So amendments began to pour upon the clerk's desk, exemplified in Mr. Bartholdt's proposed four new sections. He would have the "male person" who neglected to support his family "put upon the rack for such a length of time as, in the opinion of the public executioner, will be an adequate punishment for the offence." Pinching with red-hot tongs he would prescribe for "male persons" who deserted their wives. In other words, arguments for mediævalism simply fetched up against the sane, wholesome American sense of humor. The bill was literally laughed into oblivion, the roll-call showing only sixty members who favored it against 153 who voted to lay it on the table.

The sentencing of George W. Beavers to two years in the penitentiary settles the case of one of the ringleaders in the post-office frauds. He is one of the men for whose conduct, President Roosevelt declared, "no excuse of any kind"

could be alleged. It is now nearly three years since he was forced to resign as general superintendent of salaries and allowances; in the interval he has employed clever counsel, he has resorted to every legal technicality, and he has exerted strong political influence in order to evade the penalty of his misdeeds. But as he had plunged both arms up to the elbows in the public treasury, he finally saw there was no escape, and pleaded guilty of conspiring to defraud the Government. His confession bodes ill for his fellow-conspirators; for if the case against him is complete, the prosecution is likely to succeed against former State Senator George E. Green of Binghamton, who was indicted with Beavers. Much of the credit for bringing these postal thieves to justice is due to President Roosevelt, who has been absolutely unrelenting, and has given the officers of justice the heartiest support.

Not only has the talk of a few years ago against "government by commission" died down, but suggestions for the creation of new special bodies to deal with this, that, and the other subject come thick and fast. The future of the State Gas Commission happened to come into prominence at Albany last week. Yet simultaneously Tammany's orators were at the Capitol to plead for a Public Utilities Commission. Even before that the creation of a State Automobile Commission was being urged, and it was proposed to authorize a State Voting-Machine Commission to select electoral machinery for all the cities in the State. In short, the old rule for disposing of a puzzling problem by at once relieving an existing office of work, creating a set of new salaried positions, and securing a respite from criticism, has lost none of its popularity. A Chicago newspaper has recently compiled a list of the commissions now making regular reports in each of the States. New York, which with 25 stands fourth on the list, would come almost to the head if pending proposals should be adopted. The only States now having a larger number of commissions are Connecticut with 31, Wisconsin with 30, and New Jersey with 28. Ohio contrives to get along with 14, and Nevada with only 5. There is no theoretical limit to the number of possible boards. Every trade, every physical feature, every article of commerce, might have one to supervise it. Perhaps we should be thankful not to have twice as many.

The blank form to which the Independence League—alias Hearst's hired men—is inviting signatures all over the State, is as ingenious an appeal to the discontented as was ever drawn. Everybody with a grievance or a fad or a grudge or an axe to grind will find something for him in it. Hearst scarcely knows which is his consuming ambition, to give the farmer "good roads," "pure food," and "profitable markets," or the Labor Unions the right to "regulate the pay and working hours of working people"; is in doubt which he will first abolish, "discrimination in railroad rates" or "frauds against the people on the part of insurance companies." In a weak moment of fear lest his programme may alarm people with anything to lose, he put in the comic proviso that he is for "the protection of legitimate capital." This is the propaganda which is now afoot. We do not believe that citizens are at all awake to its significance. It is already gathering great headway, and threatens to change the political map of the State.

It is gratifying to have both the law and the ethics, in the matter of political contributions by life-insurance companies, passed upon so vigorously as they were on February 14 by the New York Life committee. When that company's campaign subscriptions of 1896, 1900, and 1904, were brought to light by President McCall's own testimony, there was a momentary effort, in a few quarters, to defend the action. The issues of the sound-money campaign were so vital—the insurance policyholder had so great a stake in them—that even if a long-ignored statute made contributions of the sort illegal, the less said about it the better. Apologies of this nature grew feebler when certain angry policyholders protested that they had favored the other side in the campaign, and hence that their own money had been secretly used against their own candidates. This protest appealed to the American instinct of fair play; and when, later on, Senator Platt admitted that the companies paid over money for State as well as national campaigns, no one was left to say a good word for the implicated officers. Now comes the New York Life's own committee, and, speaking for fellow-trustees and on advice of eminent counsel, declares that the contributions referred to were illegal and are recoverable at law from the officers who authorized them. Not stopping with this, the trustees adopted their committee's recommendation that suit for that purpose be at once begun. We imagine this to be the *coup de grâce* for such left-handed pilfering of insurance trust funds.

That the death of John A. McCall was hastened by the insurance scandals is not to be doubted. Rising from poverty and obscurity to the presidency of one of the most powerful corporations in the world, he was proud both of the skill which had won such success, and of the great life-insurance company which owed so much to his brilliant management. His resort to legislative corruption to compass ends which he regarded as desirable, was not so much an expression of his personal character as of the school of finance and politics in which he was bred. Born and brought up in Albany, familiar with the corridors and lobbies of the Capitol, a clerk in the Insurance Department, he naturally came to look upon the bribery of a Legislature or the purchase of a political machine as the only direct, efficient, and legitimate means of promoting good laws and killing bad. Probably he never considered the activities of Andrew Hamilton in their wider relations. Convinced that he had done nothing wrong, and that the administration of the New York Life had been above reproach, he really had no fear of the investigation. At first he was surprised, then prostrated, by the wrath of the public. He had really felt that his dabbling in legislation in the supposed interest of policyholders was to be commended rather than condemned. When he fully realized the extent to which his reputation had been smirched, he made large sacrifices of his personal fortune in order to reimburse the company for the advances to Hamilton. In doing this he showed a far higher sense of personal honor than either James W. Alexander, James Hazen Hyde, or Richard A. McCurdy. His fatal error was not that he worked for his own pocket, but that he sacrificed principle for the aggrandizement of his company.

Ohio seems to be feeling her way honestly towards a real improvement in government. As the Democrats did not dream of overturning twelve years of enormous Republican majorities, the ring element kept in the background for the most part, with the result that the average character and ability of Democrats elected was unusually high. The present Ohio Legislature is not likely to develop a group of philosophical statesmen. In an era of blind experiment, however, in which all parties are sailing without the aid of historic chart or compass, the new Democratic element in Ohio has at least shown that it is not dominated by the spirit of graft. Its only hope for success in elections to come lies in its ability to justify itself to the better class of Republicans whose votes placed it in power; and this it cannot do by any appeal to mere demagoguery. If it shall keep its attempts to regulate corporations within such bounds as to do no real harm to legitimate business, if it shall grapple successfully with the corrupting fee-system in local offices, if it shall recast the election laws with the interest of the individual in mind, rather than that of the party machine, and shall make such reasonable alterations in the local-option system as will satisfy the thousands who very naturally objected to the dictation of li-

quor regulations by George B. Cox, then the Democrats will remain an important factor in Ohio politics.

Reports conflict as to the attitude of the railroads towards the two-cent fare law recently enacted by the Ohio Legislature, but it is hardly probable that they will try to circumvent it. It has been framed in answer to a widespread conviction that a two-cent fare to all alike is more nearly just than three cents to the majority, with free travel to a host of public officials, newspaper men, and others who may be in a position to render favors to the roads. The trolley system has shown that reduced fares may bring into existence a vast volume of traffic which would not otherwise have been secured at all; and it is possible that the two-cent fare on the steam roads, in the comparatively thickly settled and prosperous communities of Ohio, may prove more profitable in the end than the higher rate which it supersedes. The counsel of wisdom is for the Ohio roads to assume this as at least a possibility, and bend every energy towards its realization. If the two-cent rate is essentially unworkable, such an attitude during the period of experiment will pave the way for a just accommodation better than the assumption from the start that an intentional injustice has been done.

By the action of the South Carolina Senate, the dispensary of that State has been saved, at least temporarily. The lower house of the Legislature had voted to abolish it. The official investigation, however, is still pending, and one of its most interesting features was the visit last week of Senator Tillman, the father of the system, to testify what he knew of the existing abuses. The Senator had previously stated that he believed the system to be honeycombed with graft, but that, if it were to be abolished, he would take the stump for outright prohibition rather than accept a system of local option. His "revelations," however, turned out to be entirely based on circumstantial evidence. He knew of no explicit cases of wrongdoing among dispensary officials. He told with some apparent bitterness of the aspersions on his own conduct in the first years of the dispensary. "There is no doubt," he said, "if I had been corrupt and wanted to make money out of my position as Governor in buying whiskey, I could have done it." As to the present officers, he thought they had no excuse for not submitting to full investigation. "Don't honey-fugle," he advised the committee, "but go to the bottom in any way possible." In spite of the death of the dispensary-repeal bill and the failure of the inquiry to reveal other than minor scandals, it seems to be the feeling that this year will see a bitter fight on some phase of the liquor question in South Carolina.

It is not because of any obvious commercial or moral gain that a truce in the "Montana copper war" is to be welcomed. That struggle has been attended from the first, however, by so notorious a debauching of courts, voters, and legislatures, and by such utter demoralization of the business communities in the tainted district, that anything was better than its continuance. Nobody comes out of the contest with clean hands, but at any rate there is now the hope of ending it. Whether the acquisition of the so-called "Heinze mines" will tempt the Amalgamated to throttle the copper trade again, as it did five years ago, may be doubted. Three of the nine most productive copper mines in this country are independent of the Amalgamated, and that company would probably hesitate to play their game as it did when it gave up the market to them, in 1901, by fixing prohibitive prices for its own output. But the promoters of the Amalgamated scheme will doubtless continue busy chiefly in working a much more valuable mine than the Boston and Montana, the Butte and Boston, or even the Anaconda, whose daily discoveries of new and unprecedentedly rich veins of copper have, for some weeks past, enlivened financial discussion. The richest veins which these explorers have as yet opened up have been found in Wall Street.

Mr. Balfour's surrender to Mr. Chamberlain is not less ignominious because long delayed. In fact, there would have been a certain dignity in accepting the Birmingham programme and staking his Parliamentary life upon it in a general election; but so clear-cut a policy would have been foreign to Mr. Balfour's temper. As things stand, he is a tardy and ungracious convert; the country has now spoken on the protection issue, and he himself has sunk from actual leadership to subserviency to Mr. Chamberlain. Mr. Balfour accepts protective tariffs, even with the tax on food, which he has declared impossible, as the chief "constructive" policy of the Unionists, though convinced that the party will do no constructive work for five years to come. He presumably notes that Mr. Chamberlain is old and in uncertain health, and realizes that Mr. Chamberlain's lieutenant to-day may be his successor in the near future. Mr. Balfour knows also that his most redoubtable critics among the Free Trade Unionists, Lord Hugh Cecil, Thomas Gibson Bowles and Sir John Gorst, are out of Parliament, thanks to Mr. Chamberlain. This makes the position of leader of the Opposition at least more comfortable than that of Prime Minister was. Still, there is the Duke of Devonshire, who never strikes his flag. Finally, Mr. Balfour had to choose between coming out for Chamberlain or seeing the scanty Unionist minority split in two and his own leadership become merely nominal.

King Edward's speech from the throne on Monday did not differ apparently from the run of such documents. It did, however, forecast legislation on three very contentious matters. First, the Education act, which has been the occasion of widespread discontent among Non-conformists, is to be amended; second, a new constitution is to be granted to the Transvaal; third, a policy of consultation and conciliation is to be pursued in Irish matters. The first two proposals are of a difficult sort. To withdraw state support from the Church schools will arouse very bitter opposition from the entire Establishment. To grant the Transvaal a Constitution consistent with Liberal ideas will stir up the mining syndicates, both on the Rand and in Lombard Street. Indeed, these two engagements, for a wonder, make the Irish professions seem fairly innocuous. Even the most stolid Tory could hardly object to economy and a conciliatory spirit in Irish administration. While the terms of the King's speech would admit comprehensive Irish legislation, it is not at all likely that Campbell-Bannerman will wish to renew the schism of the early eighties. In the Commons the only thing of note was the appearance of Joseph Chamberlain as *de facto* leader of the Opposition during Balfour's temporary obscuration.

The Hungarian Diet has been dissolved and expelled by the police, and new elections will be held under a liberalized suffrage system imposed by royal decree. By a curious paradox, absolutism forces a more democratic order upon its unwilling subjects. The hope is that a more complete expression of the popular will may result in leavening the extreme Magyarism of the majority. Previous appeals to the electorate have only strengthened the Nationalist coalition. One may regret the apparently unconstitutional manner in which the Parliamentary knot has been cut, but the alternative was between some such renovation of the Diet or the complete surrender of the King. For a year the Independence party, controlling the majority, has declined either to take office itself or to support any appointee of the Crown. The contestants stuck hopelessly at the Magyar "word of command" for Hungarian troops, and all legislation was at a deadlock. Until the reassembling of the new Diet on the revised suffrage basis, the quarrel is technically at a standstill. One can hardly imagine a renovation of the Diet so complete that the Apponyi-Kossuth coalition will not still exercise a dominant influence.

GERMAN-AMERICAN TRADE RELATIONS.

Prince von Bülow has already sent to the Reichstag the bill empowering the Bundesrath to extend to the United States the tariff given by Germany under reciprocal treaties to Russia, Austria-Hungary, Belgium, Italy, Switzerland, and Rumania. To defend it before the Reichstag, he has selected Count Posadowsky-Wehner, the Secretary of the Interior, perhaps in the hope that that official's friendliness to the Agrarians may help him in this hour of need. For the bill will not be passed without considerable criticism and fault-finding. The nations just mentioned obtained their treaties with Germany only after making important concessions. They will not be pleased to see the United States similarly favored in return for one or two unimportant modifications of the tariff regulations. The Social-Democrats may be relied upon to point out how quickly the Chancellor surrendered to the United States, with really not sufficient concessions, even in form, to "save his face."

Speaking for the German free traders, Dr. Theodor Barth has, according to the *Staats-Zeitung*, in a certain degree come to the rescue of the Chancellor. That is, he lays the blame for the failure to find a permanent way out of the *impasse* upon the whole German commercial and tariff policy. His unusually thorough knowledge of American affairs enables him to see that there was never much hope of inducing the Senate to do for us what the Russian, Italian, and Austrian Governments were so ready to do for their merchants and exporters. But Dr. Barth's views must make the outlook less favorable in the Reichstag, for the extension to be voted by it is to last only twelve months. What is to happen then? The *Tribune's* confidence that there will be no tariff war with Germany may seem singularly misplaced a year hence. No one who has followed the Senate's course in the last five years will delude himself into believing that the pending respite will be utilized by the Senate to confirm a reciprocity treaty, even if Mr. Root should think it worth while to submit one. And if Von Bülow must again confront the Reichstag with empty hands a year hence, his reception will be far less cordial than to-day.

There is dissatisfaction enough as it is. Cable reports state that this question is almost the sole topic of the German press to-day, the Agrarian papers distinguishing themselves by bitter attacks upon the Government. A year hence this opposition to giving the United States a good deal for nothing will be strongly reinforced by others than the selfish Agrarians and the manufacturers who loaded up with stocks of American raw or partly manufactured materials, in anticipation of a prolonged tariff war. In short, it will not do for the friends of a pacific settlement to rest on their oars during the coming twelve months because of comfortable assurances that, since Germany has more to lose by a tariff war than the United States, she will be as ready to knuckle under to us in 1907 as she has been in 1906. Speculation of this kind is dangerous at best. Moreover, Germany's protective tariffs are calling forth precisely the same manifestations of unreasoning selfishness that have marked the development of the system in this country. The Agrarians would willingly have a tariff war raise the cost of living, and thus line their pockets, while the Jingoes on both sides would welcome it as an opportunity to shake big sticks at each other. There could be no clearer illustration of the way in which protective tariffs threaten the world's peace.

To those who would clearly understand the present-day industrial relations between Germany and the United States, we cannot too strongly commend the admirable articles recently contributed by Louis J. Magee to the *Engineering Magazine*, under the title, "The American and the German 'Peril.'" From them may be obtained, not a technical discussion of tariff difficulties, but an appreciation of what each country may get from the other, and a realization of the enormous expansion in their trade relations which would come if the business men of both countries were to make a careful study of each other's methods. Germany has already been doing this on a large scale, particularly since the St. Louis Exposition, but, for too many Americans, ignorance of foreign conditions leads to a belief that there is no use in trying to find a way to increase our business abroad.

Mr. Magee, who speaks after a residence of fifteen years in Germany, optimistically believes, despite the shadow of Agrarian opposition, that "the two nations are going to understand each other better and get together in many future situations." The coming year will count heavily in deciding this matter, and this ought to stimulate all who would prevent a tariff war, with all its ugly possibilities, and also win for this country the enlarged German market to be had, not for the asking, but by comparatively small labor. As Mr. Magee says: "Industrial America, on the whole, can be proud of its export business only when every factory can, with profit, place a certain percentage of its output in the foreign market." The comparatively small percentage of that output now going to Germany is none the less endangered because Von Bülow has saved the situation for a year. The question before our financiers and manufacturers is simply whether the Senate, as now appears, is wholly beyond reach of public opinion in everything touching the tariff, and whether our business world is calmly to sit by and await the loss of one of its best customers through the sheer stupidity and indifference of our legislators.

IGNORANCE ABOUT SOUTH AMERICA.

Mr. John Barrett, formerly Minister to the Argentine Republic, and now our Minister to Colombia, is renewing his efforts to dispel "the lamentable ignorance that prevails generally throughout the United States in regard to Central and South America." Last year he offered prizes for essays by college students on historical and economic themes having to do with Spanish America. In a letter to the President of Columbia University, Mr. Barrett proposes similar prizes for the present collegiate year.

Whether several college essays of 10,000 words each will enlighten any but their writers, we should venture to doubt. Yet Minister Barrett is undoubtedly right in alleging that a vast amount of misunderstanding and prejudice characterizes our relations with the republics to the south of us, though ample knowledge is available. To say nothing of books of travel and the works of historians and statesmen, our consular reports from South America have for years been stuffed with information designed to correct the mistaken attitude of our citizens towards that region. So has our diplomatic correspondence. Mr. Barrett himself labored faithfully, when at Buenos Ayres, to get it into the heads of Americans that their stupid tariff policy was what stood in the way of better relations and better trade with the Argentine. But no visible result was ever registered. There has been no lack of seed, but it has all fallen upon stony ground. The ignorance which Mr. Barrett seeks to dissipate is largely wilful, of the kind which theologians call "judicial."

There is, however, one part of our ignorance of Spanish-Americans which is peculiarly extensive and unfortunate. We mean our total inability to appreciate their opinion of us. Naturally, we are persuaded that we are the most lovable as well as the most admirable people on earth, yet we are dimly aware, and are deeply puzzled at it, that the South Americans do not like us. They actually prefer a retrograde people like the Spaniards, or a race known to be frivolous if not wicked, such as the French; and get on better even with the stiff English! Then they talk about "sympathies" and natural affinities, and ingratiating manners and national sentiments, and other things which we do not in the least understand. There is, in fact, no more pathetic problem in international psychology than the pain-

ed surprise of Uncle Sam at discovering that he is not, with his "sister republics" of this hemisphere, the irresistible charmer that he had considered himself.

We have no wish to write an essay on that subject, but the statement of a few simple facts can do no harm. If the South Americans are cold towards the United States, it is an effect defective which comes by cause. Their suspicion and dislike have plainly deepened during the past ten years. This is admitted in official circles at Washington. It is reported by European observers. A writer on President Roosevelt's foreign policy in the last *Edinburgh* records the fact as indubitable. Why is it? Bad manners undoubtedly account for something. We have persistently been overbearing and contemptuous in our dealings with the Latin Americans. The comic stage scarcely misrepresents the thing: one virile American is capable of knocking together the heads of six "dagoes." That fairly mirrors our national attitude; and it cannot be called conciliatory. In commercial relations, too, we have been blundering and tactless. After having legislated so as to make a flowing trade with South America impossible, we lay it up as a grievance against South Americans that they will not buy of us. Scarcely a session of Congress passes without an angry reference, by indignant legislators, to the fact that Brazil and the Argentine and Chili take more goods from Europe than they do from us. This, again, is not exactly lubricating.

All these things, however, might be dismissed by the South Americans as merely bad breeding and poor business, but they cannot so easily put aside the graver cause of their distrust. It is not the absence of politeness, on our part, but of justice, of which they complain. They look upon the United States as a country which has several standards of international fair dealing, and which applies its lowest and roughest to them. And this feeling of theirs has been distinctly heightened by the tone of President Roosevelt's public utterances respecting them. He has abounded, of course, in disclaimers of territorial ambition or aggrandizement at their expense. But they have a proverb, equivalent to our "deeds speak louder than words" (*hechos son amores y no buenas razones*), and they apply it to the President. Protest as he may, his real attitude, they think, is that of one who considers that they have no rights which can stand in the way of his wishes. They recall how brutally he proposed to "take the matter into our own hands" if Colombia stood upon her undoubted prerogative. And his talk about his "police power" over them, with his intention to move against them if they are "disorderly," not only offends but disquiets them. They see in it all a sign of overmastering contempt for them; and they know that, out of contempt, justice was never born.

There is clear evidence in the South American press that President Roosevelt's descent upon San Domingo has intensified the sentiment against us in all Central and South America. The question asked is, Where next is the Big Stick to fall? And if Minister Barrett were free to tell why Colombia is not ready to fall into our embraces, he would have a tale to unfold not only of foregoing wrongs, but of present refusal to do justice. Colombia is to-day, we are informed, asking our Government to agree to arbitrate the differences between the two countries growing out of the events at Panama in 1903. She urges merely that a tribunal of impartial jurists be permitted to decide whether President Roosevelt exceeded his powers, under either the treaty or the general law of nations. All such disputes, Mr. Roosevelt vehemently contended in the arbitration treaties which he urged upon the Senate last year, ought to be arbitrated; but we are told that he will not listen for a moment to Colombia's plea. Arbitrate with a dago! Permit jurists to review *my* conduct! Well, so long as such an attitude is taken, we fear that the prejudice of South Americans against us cannot be removed even by the youngest essayist in our colleges.

OUR THREAT TO CHINA.

Beyond doubt, Secretary Root has received alarming reports from our consuls in China, of a sort to make him and the President anxious about the situation in that country. They are obviously unwilling to accept the publicly expressed opinion of the Chinese Minister that there is no ground for apprehension. In a recent interview he declared that there is no probability of another Boxer uprising. The existence of a serious boycott the Minister admits and deplores, but the present anti-American movement is primarily the work of merchants and men of education, whereas the Boxer uprising was an outbreak of the lower classes, after a couple of famine years. Moreover, there are now no weak or sympathetic viceroys to connive at a revolt, as was the case in 1900. Finally, the new Chinese army affords a security not available when hordes of Boxers were assuming control of the interior.

Despite all this, there may be warrant for the formation of an expeditionary corps, or at least the grouping of certain extra troops in and about Manila in the expectation of serious trouble and the need of protecting Americans. The President may desire to be even more forehanded than in 1900, when we were able to throw two regiments into Tientsin with comparative speed. But the frankness with which all preparations are announced and the anxiety of the Washington officials is proclaimed to the whole world, savors too much of "shirt-sleeves diplomacy." We are wholly at peace with China; so far as the official relations of the two nations are concerned, there is not the slightest reason for the United States to prepare to violate the integrity of Chinese territory. Every one can appreciate the serious situation that would arise if the War Department were to announce that, on account of private news of impending trouble in Japan or in Italy, which might endanger the lives of American citizens, troops were being assembled at the nearest point of embarkment for the possible scene of hostilities.

Even when the war with Spain was at hand, there were various efforts to explain away the first movements of regular troops towards the South. In the case of China, however, there is no concealment of any kind. The President believes there may be trouble, and off the troops go. The purpose of their going, their rendezvous in or near Manila, the officers to command them in China, the preparatory manœuvres they are to carry out to fit themselves for service in China, are, as the Germans say, "tolled forth by a great bell." Whether the Philippine Scouts shall be employed is also discussed. In short, the whole world is informed of every step without the slightest regard for China's feelings, and apparently without inquiring whether all this will not offend the Chinese and intensify the already costly boycott. The rest of the world is strangely unmoved. The Kaiser, who was so hot for revenge and bloodshed in 1900, has not yet breathed any threats of fresh slaughter, or taken the slightest precautions to be ready, so far as is known. In England, France, and Italy, as in Germany, if there are preparations being made for another march to Pekin, due regard for the feelings of China keeps the fact locked up in the rooms of the various general staffs.

It is not surprising that members of the Asiatic Association, composed of American merchants engaged in the China trade, are reported as being "considerably disturbed" over the Washington Government's openly announced military activities. Their advices coincide with those of the Chinese Minister, and they are reported to be convinced that the current talk of an uprising is best calculated to bring it about. In our opinion, their view is correct. The educated Chinese know perfectly well that the United States would proceed in this way against no other great nation, and the facts, if not already published in China, are likely to be as widely and as quickly diffused in that Empire as have been the accounts of the American outrages against Chinese residents or

travellers. The vice-president of the Pacific Mail Steamship Company declares that our trade in China is "practically gone," as the result of our unfair treatment of the Chinese. At the very least, the residents of China will see in our action a determinedly hostile spirit, looking only for an excuse to land an army and perpetrate again some of the horrible crimes which thoroughly disgraced the so-called Christian troops in 1900. The attitude of our Government, in brief, is one of distrust and contempt, and smacks of the same spirit which makes the average American look upon every Chinaman as an underfed and overworked laundryman, to be kicked or stoned if the policeman's back is turned.

To menace China is the wrong way to go about it. To allay the intense bitterness with which Americans are regarded in China, Congress must do justice to the Chinese nation; must adopt a treaty dealing with her subjects as with those of any other nation. She wants the assurance that her travellers will not be maltreated at our doors; that the whole Chinese population of a city like Boston shall not again be arrested in a body and shamelessly imprisoned under conditions resembling those of the Black Hole of Calcutta; that her subjects shall not be excluded when emigrants from Bohemia and Hungary and Russia are freely admitted. Failing these healing measures, there will not for years be cordial relations between the two countries. And if American troops are again landed in China, they will be opposed with a hatred more intense than that of 1900, and born of a consciousness of having suffered great injustice at our hands.

THE MUNICIPAL OWNERSHIP TROUPE.

We refer to that aggregation of talent which is touring the State in the interest of Hearst as Municipal Ownership Governor. The manager of the Troupe —one remembers how "The Matthew Arnold Troupe" got reduced fares—is Mr. Max Ihmsen. He is the gentlemanly agent who set out to buy the Presidency for Hearst in 1904. To buy a mere Governorship might seem, after that, something of a come-down for one of his abilities, but we presume the commissions are satisfactory. With him are associated certain ex-politicians, ex-employees of corporations, and ex-owners of a character.

This pleasing combination of performers descends upon city after city with a fine derangement of the methods of a circus and those of the advertisers of a patent medicine. No sooner is their metaphorical tent pitched, than they clamorously call upon the public to walk up and see Hearst in his unrivalled feat of breaking the necks of three giant monopolies at once. In the streets the deft demonstrators set up their stands and open their satchels. Are you suffering from corruption? Try a box of Hearst's Municipal Ownership Pills. Is the body politic covered with blotches? One application of Hearst's Municipal Ownership Wash will be a sure cure. Meanwhile, the pavement is littered with handbills, sandwich-men parade up and down, cornets are sounded, and Tom Johnson's famous Ohio campaign in a devil wagon is far outdone by the blare and glad publicity of the Hearst Municipal Ownership assault upon the Governorship of the State of New York.

It all sounds like a bad joke, but we assure our readers that it is no laughing matter. One of Murphy's errands at Albany the other day was to ascertain the true strength of the Hearst movement up the State, and all the politicians told him that Hearst was "coming strong." There is, of course, no real Democratic organization throughout the State to withstand Hearst. What there was in 1904 was merely a shadowy personal appurtenance of David B. Hill; and now that he has let go, the remains of it are for anybody to buy. And the purchase is going on swiftly. Word has gone out that the Hearst band wagon is distinctly the one to climb into, and the rush to get aboard is reported to be furious. We hear of from 40 to 400 signatures a day being affixed to his petitions in a single county. The signers are supposed to be filled with a burning desire that Hearst become a municipally owned Governor, and that at the same time a State Legislature be elected that shall have municipal ownership written on its heart. This is the sort of evidence which is being laid before Murphy. Its effect in inclining him to the alliance which Hearst is proposing can scarcely be doubtful. For many weeks, now, the Hearst papers have not pictured Murphy in convict's garb. Nor have they shown him dining luxuriously at Delmonico's (it is well known that Hearst always dines at Dennett's) while his poor deluded followers are gnawing their nails outside. On the other hand, Murphy's personal organ has left off attacking Hearst, reserving all its fire for Mayor McClellan; while the trip of the Tammany chief to Albany to explain to the Legislature through the eloquent and suddenly converted Cockran that the Wigwam is now in favor of the control of public utilities, is a pretty good proof that Murphy perceives the private utility of joining forces with Hearst. Neither man, of course, has a single personal or political conviction that would stand in the way; and we shall doubtless soon be gazing upon the edifying spectacle of two men, of whom one has said that the other is a thief and assassin, while the other has declared the first to be an anarchistic murderer, taking sweet counsel together, all for the greater glory of municipal ownership!

The movement shows now many symptoms of a mounting craze. The very words "municipal ownership" are made a sort of mysterious and sacred symbol. An actual working plan to secure municipal ownership is the last thing the Troupe thinks of, or needs to think of. You must not ask them where they are to find the necessary money, or how they are to get around the State Constitution. Such questions imply a certain sanity in the municipal-ownership extremists, whereas they give every sign of being afflicted with a mania. Very likely, if you pressed them, they would say that Gov. Hearst might suspend the Constitution for two years, or until his plans were carried out. Reason, measure, the hard facts of finance, the ugly facts of politics are all left out of the reckoning. What is expected is that there will be a great rallying of the disappointed and discontented, of place-hunters and amiable enthusiasts and the mildly crack-brained, who, together with the labor-union vote and the Tammany vote, are to win Hearst the Democratic nomination for Governor and sweep him into office. What will he do with it? Silly question! He will have been tremendously advertised, and that is enough.

All this may be thought fantastic, unheard-of, impossible. So it would have been twenty or even ten years ago. But, as the orators tell us, our ideals and morals have "improved" since then. Our political standards, at least, have been improved to the extent that the Hearst candidacy has now seriously to be reckoned with. The clamor of it will fill the State. Republicans are affrighted by it, and decent Democrats know not where to turn. A man who, but for his money, which he pours out lavishly in politics, would never be thought of, heading a movement which, if not financed by him, would attract but few with brains in stable equilibrium, is raiding the chief office of the State, and sober people are saying that there is no means of beating him off. This is the political portent now confronting the citizens of New York. About it they will have to think, write, speak, act for months to come.

WOMEN WAGE-EARNERS.

A movement was set on foot some months ago by the General Federation of Women's Clubs, the Women's Trade Union League, and women settlement workers to secure an investigation by the Department of Labor into the industrial conditions of women in the United States. The plan met with the approval of President Roosevelt, who recommended it to Congress, and of the Secretary of Commerce and Labor, who has asked for an additional appropriation to enable the Department to carry on the

work. It ought not to be difficult to convince the committees on appropriations that such an investigation would be, merely as a basis for future legislation, amply justified. Interest in the wage-earning woman has passed the stage of curiosity and amusement. That she is now regarded as a serious element in the social as well as the industrial situation, is manifest.

Most of the ills, real and imaginary, with which society is afflicted have been, at one time or another, laid at the door of the woman wage-earner. Race suicide, the decreasing marriage rate, the increasing divorce rate, wife desertion, undermined domesticity, even the disappearance of the cook, have been, among other calamities, ascribed to the iniquitous tendency of the modern woman towards financial independence outside the home. It is a simple matter to make such charges, and under present circumstances impossible either to prove or disprove them. We have practically no data to indicate the effect, social or other, which has followed the entrance of women into industrialism.

That important changes have occurred since women took to working for wages instead of for their board, no one can doubt. It remains to be proved that society has suffered. No one but a theorizing sentimentalist ever maintained that women at any period constituted an idle class. They have, in fact, always worked. The share of women in the world's toil has probably not increased, and there is reason to doubt if it has changed radically in character. To demonstrate this theory, or else to disprove it, will be one result aimed at by the proposed inquiry.

In a recent number of the *Journal of Political Economy*, two University of Chicago women, Miss Breckenridge and Miss Abbott, publish a résumé of that part of the report of the twelfth census which deals with women engaged in gainful occupations. From these statistics it appears that more than five million women were earning money in 1900, and that the rate of increase, for the decade, of wage-earning women was much greater than the corresponding rate for the employment of men. The number of women in industry actually increased faster than the female population. The gain was not confined to the East, where immigration might be supposed to have caused it, but was marked in all sections of the country. The census scheduled 303 occupations, and women appear in 295 of them. The only occupations in which they are not found are the United States army and navy, the fire departments, and "helpers to roofers, slaters, steam boiler-makers, and brass workers." Helpers in this sense mean unskilled workers who supply physical strength. In almost all occupations women are increasing. In only four important occupations are they decreasing. It is rather amusing to find that the occupations which are becoming unpopular with women are of a character usually described as feminine—dressmakers, seamstresses, servants, and waitresses. Women dressmakers increased only 17.8 per cent. between 1890 and 1900; men dressmakers increased 150 per cent. Women milliners increased 40.5 per cent.; men milliners 340 per cent. Men appear also to be crowding women out of the saloon business, the laundries, the tailor shops, and, to a certain extent, the cotton mills. But women increased in all departments of trade and transportation 120.3 to men's 37.6 per cent. Women distanced men in all but one of the five large groups of the census classification. The exceptional group was that of domestic and personal service.

The census, however, only enumerates, and does not explain. Sometimes its figures are gravely misleading. If the statistics relating to the garment trades, for example, were accepted literally, the inquirer might receive the impression that women are dropping needles and thread and that men are snatching them as they fall. When we read that women seamstresses increased in the decade only 0.04 per cent., while men seamstresses increased 20.8 per cent., we gasp first, and afterwards wonder what was meant by the term seamstress. The census throws no light on the distinction between a seamstress, a dressmaker, and a tailor. Is the Italian woman who "sews pants" in a tenement a tailor or a seamstress? Is the girl in a fashionable shirt-waist shop a dressmaker? What is the young girl who performs simple tasks in a cloak-making factory? The census does not say.

Nor does it give any real information as to the competition between men and women in trades and professions. One is left to infer that men and women are performing substantially the same tasks, but even superficial observation of the facts disproves this hypothesis. We really do not know just how far, if at all, women have displaced men in industry; neither do we know exactly the extent of direct competition between the sexes. The subject is of great importance. The study published in the *Journal of Political Economy* rightly points out that "with it is inextricably interwoven the vital question of women's wages, and the more vital question of the nature of the work to be done by women, the dignity and permanence of their position in the industrial world, and the effect upon them of the work they do."

ASPECTS OF COMIC JOURNALISM.

The resignation of Sir Francis C. Burnand, for twenty-five years editor of London *Punch*, reminds one how little that paper has been subject to the vicissitudes of journalism. As if by foreordination, the admirable parodist, Owen Seaman, takes the head of the historic table, and *Punch* will, if anything, be more *Punch* than ever. Others may change, but *Punch* retains a kind of Olympian uniformity. From its first number, sixty-five years ago, to the last, its outward appearance and inward savor are practically identical. England has been in conspiracy to provide it with talent. During the retiring editor's term of office the paper lost such artists as Charles Keene, Du Maurier, and Sir John Tenniel; but it also saw the rise of Mr. Linley Sambourne's forceful caricature, of Mr. Raven-Hill's delightful rusticities, of the nervous and most expressive art of the lamented Phil May. In fact, barring an inclination to overindulgence in rather trite doggerel, *Punch's* jorum has rarely been more tasty than in the past quarter-century. Its only serious rival in the comic field has been *Fliegende Blätter*.

There is, of course, the prevailing American view that *Punch* is dull. Dull it is, in the sense that the best fun of the most jocose family may be merely tantalizing to the outsider. A nudge to the initiated may be sufficient to recall jokes proved by a thousand laughs; the uninitiated needs a clue. Now, *Punch's* family is London—a family whose acquaintance is tolerably worth while; and probably no one who has not imaginatively made himself familiar with the mood of London has any business with *Punch* at all. It is the homesickness for London that extends the subscription-list to the bounds of the Empire; it is the desire to know what London thinks of itself, of the provinces, of the world, that makes readers for *Punch* in every land. It represents London in the mood of intellectual dalliance as thoroughly as *Fliegende Blätter* does non-Prussian Germany. This representative quality gives to these two comic papers something of the solemnity of institutions.

No other nation has shown the same continuity of humor. French comic journalism, which in sheer literary and artistic ability yields to none, is always prone to lapse into didactic and fairly savage satire, or into crapulous buffoonery. A genuine humorist like Gavarni or Caran d'Ache is a rare apparition; the tendency is towards the portentous caricature of Daumier or Forain. One remembers a few great names, but hardly the journals that kept them in pay. In our own country, the absence of anything like genuine comic journalism is even more striking. We deal with isolated names, and not with journalistic pedigrees. In fact, the only caricaturists that approximately measure up to the English or Continental standards are those that work for the daily press. If Mr. McCutcheon should come East, it would shift the centre of gravity of newspaper caricature; if Mr.

Rogers should quit Herald Square for Park Row, a great deal of political satire would take the Subway with him. Throughout American comic journalism the same lack of sequence is felt. The only thing that changes not is the citation of those consecrated forms, the goat, the Irishman, the negro, the mother-in-law, the shrewish wife, the bibulous husband—"subjects of universal interest," the editor of a comic weekly once sardonically called them.

Comic journalism suffers equally among us from vulgarity and fastidiousness. If to write and draw down to the least exacting sense of humor makes a fairly negligible comic press, to follow pseudo-æsthetic and pseudo-literary ideals makes a periodical that, considered as pabulum for the comic spirit, is neither flesh, fowl, nor good red herring. In particular, the attempt at pictorial completeness works against anything like good humorous illustration. It is the day of the photograph, and frequently it seems as if the aim of illustrators was to apologize for the fact that they are not photographers, by making their drawings as photographic as possible. Now the zest of a joke lies in its brevity; and the shortest and most direct method is the best for the joke addressed to the eye. A few scratches of Keene's pencil, a scribble of Hokusai's brush point, afford an infallible hieroglyph for a laugh; and one need not ask far among artists to learn that these notes, abstract, exacting as regards thought and selection, economical as regards technical means, are yet far more valuable pictorially than what the layman calls a "finished" drawing.

The French and Germans have maintained the true tradition of caricature. The English have kept it, with the additional advantage, referring to comic journalism, of a settled social order, a common range of personal interests, and a somewhat uniform sense of humor. Because Mr. Gould of the *Westminster Gazette*, for example, takes counsel of his public, and not of the drawing-master, his caricatures have the matter in them. When he represents Mr. Chamberlain in the boat, reassuring sinking Mr. Balfour with the words, "If you shouldn't come up, Arthur, may I keep the boat?" he counts on a public versed in the chances of the river, and in its humors. The same drawing would lose half its appeal in New York or Paris. Until New York has developed a similar common fund of experience, it will hardly have comic papers of the true metal. Mr. John La Farge has somewhere described a work of art as essentially a transaction between two parties: the man who makes it and the man who sees it. The work itself is merely the occasion of a kind of understanding, a compromise, if you will, between what the artist put into it and what the layman makes out of it. This principle is doubly true of wit and humor. Their quality depends upon the quality of the audience. We have given Mark Twain his millions of readers, but we have not yet developed the public that requires its discreet weekly service of humorous comment on the week's happenings. We stand half-way between pioneer and urbane conceptions of the comic, and nothing will hasten the process more than a fairly clear idea of aims among editors and illustrators. Certainly neither the current bufoonery nor the affected artistry of the few that deal with "society," is making effectually for the gratification of the mind or even for the mere tickling of the ribs.

MAURICE AND THE WORKINGMEN'S COLLEGE.

LONDON, February 3, 1906.

In 1854 the Workingmen's College was founded by F. D. Maurice and his friends, among whom were numbered Kingsley, Ludlow, Tom Hughes, and Lowes Dickinson. On the 20th of January, 1906, the college moved from its old home in Great Ormond Street and took possession of a new, large and commodious building in another part of London, built and admirably suited for a collegiate institution which supplies to a body of workingmen an education, and also social advantages, in many ways resembling the educational and other benefits obtainable by richer men at our universities. The opening of these new buildings is not the sort of fact which is telegraphed across the Atlantic. Yet it is an event of quite possibly more permanent importance than the striking issue of a general election which may, after all, like many electoral victories or defeats, produce few results which are long remembered. In any case, the history and the fortunes of the Workingmen's College created by Maurice may, from two different points of view, be of some interest to the readers of the *Nation*.

The college is much more than a mere memorial of its founder: it is a monument which displays a side of his genius that is often forgotten. To his devoted admirers Maurice appeared the English theologian of his age. To most men of the generation among whom he exerted the greatest influence—to persons, that is to say, who flourished between 1850 and 1870—he often appeared to be something of a mystic, who, since they did not understand him, they sometimes too hastily assumed could not be understood. Many even of those who stood quite apart from the theological doctrines of which he was the earnest exponent, felt him to be a man of the highest intellectual power. "I have always thought," wrote John Mill, "that there was more intellectual power wasted in Maurice than in any other of my contemporaries. . . . The nearest parallel to him, in a moral point of view, is Coleridge, to whom, in merely intellectual power, apart from poetical genius, I think him decidedly superior." Even this critic, who found the greatest difficulty in accounting for the possession of the highest mental and moral gifts by a thinker who came to moral and religious conclusions so different from those reached by himself, felt a "deep . . . respect for Maurice's character and purposes, as well as for his great mental gifts." In truth, Maurice was one of those rare teachers whose goodness, wisdom, and disinterestedness, and unbounded zeal for the promotion of everything which was good, noble, and holy, was, so to speak, almost visible.

But while Maurice's character, as personally known to his contemporaries or as handed down to a succeeding generation by an admirable biography, possessed the untold attraction of goodness and nobility, yet many Englishmen, while fully sensible to his virtues and his charm, have always felt that he was a mystic, and have drawn the inference, for which there exists little valid justification, that mysticism means the sort of dreaminess which makes a man unpractical, and unfits him for doing much good work in this very workaday world. They imagine that the life of a theologian in whom they trace mystical tendencies must in some way or other have been, to use Mill's expression, though not exactly in the sense in which Mill employs it, "wasted." The Workingmen's College is the abiding confutation of this singularly erroneous idea. Its whole history proves that its founder possessed two rare gifts constantly lacking in men reputed to be specially endowed with hard common sense. He possessed at once the insight to perceive the real wants of the men and women among whom he lived, and also the ingenuity to devise the means by which to meet these needs. Long, indeed, before 1854, philanthropists and reformers to whom the meed of high praise should never be denied, had pressed upon the public the duty of educating the English people; but the preachers of this sound doctrine tended to identify education with the diffusion of useful knowledge, and felt with James Mill as if, from an educational point of view, "all would be gained if the whole population were taught to read, and all sorts of opinions were allowed to be addressed to them by word of mouth and in writing." Maurice, in common with many other good men, perceived that this ideal of education was inadequate, and that it did not provide, for the best of the working classes, the real benefits which, even in 1832, English universities conferred upon the most fortunate of their students—that is to say, a liberal interest in various forms of culture, and especially in literature, and also the inestimable, though hardly definable, training created in the best of our colleges by the habits and traditions of college life. He longed to give to intelligent wage-earners something like collegiate education. Many shared his desire, and this sympathy with his object gathered round him a body of zealous associates.

Maurice went, however, a step further than merely pointing to a fine ideal. He perceived the means by which this ideal might be more or less realized. He saw, as few had done, that workingmen of intelligence, when not oppressed by too severe toil, could and, as the fact has proved, would give their evenings to education. He saw, also, that an institution might be formed wherein education might be combined with common social life; that you might, in fact, create a school for work-

lngmen whlch was no mere mechanlcs' lnstitute, but was in a true sense a real college. He further anticipated with truth that many among tbe best university graduates would freely labor at bestowing upon others the knowledge which they themselves had obtained at the universities, and obtained, in many cases, through the liberality of founders and benefactors. The Workingmen's College has been the practical fulfilment of Maurice's ideas. It is a college open to workingmen; it is a college where teaching takes place in the evening; it is a college which has kept before itself the constantly expanding ideal of a liberal education; it ls a college where the students, many of whom have belonged to it and labored in and for it during their whole lifetime, have acquired during the last fifty years the best traditions of English university life. One fact among a hundred exemplifies the success of Maurice's experiment. The means for acquiring the new buildings whicn the college now occupies were supplied in part by a legacy of £5,000 or £6,000 from one who in his youth had been a student at the college, and, though his name was hardly known to most of its members, recollected through life and with gratitude the benefit conferred upon him by his collegiate education.

The college is not only a living monument to the genius of Maurice, it is also an illustration of that desire to do away with class feuds and animosities which was the best characteristic of English life during the last fifty years and more. This ls a trait to which the future historian of the nineteenth century may, we trust, do justice, but it is a feature of English life which is apt to escape attention amidst the rant, the cant, and the turmoil of general elections and party conflicts. This desire for reconciliation is to be found in the reformers of every class and school. Bentbam, Arnold, Cobden, Lord Shaftesbury, Maurice, and thousands of men influenced by these leaders and teachers, all desired a policy of reconciliation, though they pursued it by very different means. The earlier reformers, whether typified by Bentham or by Sydney Smith, aimed at repealing all laws and amending all institutions which were obviously unjust or demonstrably harmful to the poor. Philanthropists such as Lord Shaftesbury were prepared to go somewhat further, and, at the risk of even dangerous interference with trade, put a stop to any mode of manufacture which was injurious or was deemed injurious either to children or to women. Free trade itself, though an economic doctrine favorable to the growth of commerce, was considered by Cobden and Bright to be intimately connected, if not necessarily bound up, with justice to the poor and needy. All these men had more or less accomplished their work by 1854. Maurice and his disciples went a step beyond; they wished not only to ensure justice for workingmen, but to sympathize with and gain in return the sympathy of wage-earners. To call Maurice a Socialist is, we now know, as absurd as to call him either a heretic or, in the ordinary sense of the term, a Free-thinker; but Maurice and his friends wished to recognize what they deemed the good side of Socialism, and shared fully the passionate lndignation of Socialists against any social arrangements which might seem to base the prosperity of a state upon the poverty or misery of the mass of the people. These men, tbough they knew it not, believed as firmly as Bentham that any society ought to exist for the happiness of the greatest number of its members; if, as may be said with truth, Maurice or Arnold substituted welfare for happiness, they assuredly failed to see that the happiness aimed at by the Utilitarians included welfare. Tbis difference is now of little importance. The noticeable matter is the extraordinary success with which the labors of many men of different schools were crowned. Free trade removed a root of bitterness which did more than any revolutionary doctrines to set class against class. Tbe prosperity wbich it induced deprived Chartism of its power, and, greatly to the benefit of the nation, delayed democratic change till it could be carried out without provoking either revolutionary or reactionary violence. To attribute anything like this widespread effect to the Christian Socialism of Maurice, of which the genuine Christianity is now much more noticeable than the very moderate Socialism, would be absurd. Yet the movement of which the College is at once the memorial and the permanent result, did much. It opened friendly communications between the wealthy classes and the wage-earners; it was a sign and a cause of a wide change; it led men to consider witb fairness doctrines which even the reformers of an earlier generation had treated as heresies; it brought men of all classes nearer to one another.

'L'Étape,' a French novel which is, unlike most French novels, a sort of religious tract, describes a society for the education and enlightenment of Parisian artisans. This school bears a resemblance to the Workingmen's College. A priest who, an ardent Catholic and a fervent Liberal, believes that Catholicism is the true friend of democracy, appears at this college, if we may so call it, and tries to preach his doctrine to its students. Tbey refuse him a hearing, meet his attempted arguments with threats of personal violence. The scene imagined by Bourget is probably drawn in too strong colors, yet the 'Vérité' of Zola, which is, in its tone and intention, the exact antithesis to 'L'Étape,' leads from one point of view to the same conclusion. From both novels we gather that the Conservative and the Liberal, the priest and the workingman, are divided from one another in France by inveterate hostility. The gulf which divides them is too wide to be passed over, yet a calm inquirer finds it difficult to believe that France can prosper unless this gulf can be bridged. However this be, the Workingmen's College is one of the many evidences of good will among different classes created by the strenuous efforts of good men during now more than fifty years. It is this good will which, as long as it lasts, is the real strength of modern England. AN OBSERVER.

NAPOLEON VICTIM OF HIS CLAN.

PARIS, February 2, 1906.

The personality of Napoleon the Great has a curious hold on all who once become interested ln lt: I allude especially to the historians. Thiers gave a great part of his life to the study of the Consulate and the Empire. We have at present two historians who are devotees of Napoleon, M. Vandal, who continues the history of the rise of Napoleon in the period of the Directory, and M. Frédéric Masson; they both owe their popularity to their hero worship, and they must strike a very responsive chord in the public, as their success has not been impaired by the deplorable failure of the Second Empire, which, having begun with a *coup d'état*, ended in the loss of the provinces for France. Tbe present generation has no desire whatever to return to the Imperial system; it has for the person of Napoleon I. a sort of poetic admiration; it has the feeling that he was an exceptional being, and that he was in reality the beginning and the end of an era.

M. Masson has just published the seventh volume of his 'Napoleon et sa Famille.' This indefatigable writer tells us that, though he has already written twenty-one volumes on his prodigious hero, he is far from having exhausted his subject; he has still several volumes to publish. He prophesies that, after he has accomplished his task, there will be still much to find and many materials for other works. His passion for his hero makes one think of a painter who is in love with a model, and is never tired of making sketches of his idol and of giving her a place in all his compositions. The new volume embraces the years extending from 1811 to 1813, during which were prepared the fatal events that marked the downfall of the most extraordinary fortune that history offers to our meditations. The date of the great disasters has not yet arrived, but these disasters are, so to speak, in germ in the general state of Europe, in the combinations of the enemies of Napoleon and of France.

The preface, or ratber the "avant-propos," of the new volume is of high interest, as it propounds the general theory of M. Masson regarding the Napoleonic period. This, though it lurked in all his preceding works, had not yet found its definitive expression. In his opinion, the obstacle to Napoleon's gigantic plans of domination over Europe came not only from the great Powers themselves, and from England, whom he found directly unattackable and who subsidized the armies of the Continent, but also from the stupidity, the worthlessness, the ingratitude of his own brothers and sisters. He dreamed of surrounding the French Empire with satellites, who could move only in his orbit; his Corsican and clannish instincts inclined him to choose these satellites from among his own family and those connected therewith; but they all disappointed him; they identified themselves with the interests of the countries over which they ruled; they believed themselves to be sovereigns by divine right, they tried in every way to escape from the domination of the Emperor.

"In my volume vii.," writes M. Masson, "I consider less the action exercised by Napoleon upon his family than that exercised by it on his work. It is no longer Napoleon who raises his brothers or degrades them; it is they who make themselves the artisans of his fall. It is not he who imposes his laws on them, it is they who, consciously or unconsciously, by their errors or by their crimes, prepare his ruin. Their acts are most of them accomplished

outside of his control, of his authority, of his will; but this is in virtue of the delegation he has granted them, of the powers he has bestowed, of the system which he has established. Thus, they are bound so closely to his conception of government that, if he is not historically responsible for many of their acts, he must bear the chastisement for them. The instruments which he chose and employed were bad; he made them worse by his veto or his complaisance. . . . After the death of Napoleon, each of his brothers published or inspired apologetic memoirs, in which they tried to throw upon Napoleon the responsibility for their family disaster; they gave themselves certificates of intelligence, generosity, loyalty, liberalism."

M. Masson does not attempt to write the complete history of the countries which were for a while submitted to the Napoleonic rule; he has little doubt that many papers have been destroyed, and he has confined his efforts to a sort of résumé, sufficient to give a just idea of Napoleon's relations with his family. He makes his readers acquainted with the feelings and actions of Madame, Napoleon's mother, of Joseph, Louis, Lucien, Jerome, Fesch, Élise, Pauline, Caroline. Thus limited, his task was still very great.

"I have an account," he says, "of a secondary play which interweaves itself with the principal drama and of almost secondary scenes. My personages appear for some minutes in the forefront, they even influence the end; but they are nevertheless secondary, and their characters, however curious they appear to me, are never drawn in traits of beauty or of heroism."

Volume vii. begins with an account of the Council of 1811, and of the struggle between the Emperor and the Sacred College. Napoleon wished to give the universal Empire a universal Church. The negotiations with Pius VII. respecting these religious matters have lost much of their interest; but they had a very brutal end. The Pope was arrested and taken prisoner to Fontainebleau.

It may be said that the fortune of the Bonaparte family was at its height in the year 1811. M. Masson occupies himself first with Pauline, who had followed Madame to Aix-la-Chapelle. He describes her society, her intimacy with Montrond, with Canonville, her amusements; he speaks of her extravagance. King Jerome, in Westphalia, acquired neither consideration nor authority. His army, his kingdom, were really given up to Davout, who disposed at his pleasure of the Hanoverian battalions. The funds in the Treasury "are as much my property," wrote Napoleon to his brother, "as what I may have in the Bank of France." Jerome was not unintelligent; he understood what dangers threatened the Napoleonic domination, with such a system of tyranny. Jerome was anxious to play his part in a great war; he considered "that Westphalia was lost to him, and placed all his hopes in his army and in the command he might obtain in it."

Louis was ill and hypochondriacal. He left Holland without renouncing his throne, his people—what he called his country. He complained constantly of Napoleon, who not only had robbed him of the crown, but had poisoned his life. "I have," he writes to Lucien, "been maltreated, from my youth, by my brother." Napoleon first forced a crown on him, and then an abdication; he already had forced a wife on him. Louis is a victim; he writes volumes on his misfortunes, from Grätz, where he was living at the time, under the name of Count de Saint-Leu. He writes a poem, "Marie, ou les Peines de l'Amour," and is more occupied with his mediocre verses than with anything else.

Shall we follow Hortense in her journeys, in her villeggiaturas? Lucien's movements offer greater interest. He arrived in England at the end of 1810. He writes: "The tyrant has made a mistake. It gratifies me that, notwithstanding his desire to disgrace her [his wife Alexandrine], the news of the reception which is given us here will come to his ears, and that the image of your mother [he was writing to his children] received by the noble English of this island will pursue him and irritate him in the midst of his imperial feasts." Lucien and his wife went to Ludlow, where Lord Powis offered them the hospitality of Dinham House. Soon afterwards, Lucien bought for £9,000 sterling an estate near Worcester and Ludlow. He also began work on a poem, "Charlemagne." His wife writes secretly a poem on "Bathilde, Reine des Francs."

It is rather fatiguing to attend M. Masson in his excursions from one member of the Imperial family to another; he takes us from Lucien to Élise, to Caroline, to Murat, to Joseph, observing only a chronological, not a logical order. The details about Murat are among the most interesting portions. M. Masson judges him well, and renders full justice to his courage:

"Murat is the most admirable soldier, the most astonishing leader, the cavalry officer who on the battlefield has the clearest view and the promptest action, a form of boldness which belongs only to him, a *désinvolture* in the presence of death which makes it of little account to those who follow him. . . . As long as he takes the aggressive, he is unique; on the defensive, he is flat, loses his power, gets discouraged; against misfortune he opposes neither resistance nor tenacity."

During the Russian campaign, the Emperor confides to him four *corps d'armée*, twelve divisions, thirty-six thousand horse, the most astonishing mass of cavalry that has been seen in modern warfare; he leads it very badly. He says to an officer sent him by the Emperor: "Tell the Emperor that I have conducted the vanguard of the French army further than Moscow; but I am bored, you understand? I am bored. I want to go to Naples to occupy myself with my subjects." His subjects? Truly he had made himself popular in Naples, with the lazzaroni by his theatrical ways; but would he have been if he had not been chosen and supported by Napoleon? It was the fundamental error of Murat, of his wife Caroline, of Joseph in Spain, to believe in their independence; they were all nothing, if not the vassals of Napoleon. It was Napoleon's mistake to take such instruments for his gigantic projects; he could not say, "Uno avulso, non deficit alter"; he made choice only in his own clan, and the most intelligent member of his family, Lucien, had become his bitter enemy.

Correspondence.

THE LATE KING OF DENMARK.

To the Editor of The Nation:

Sir: In the number of your highly esteemed paper for February 1st I ran across the following lines:

"Few monarchs have been more sorely tried than King Christian. Early in his reign the Danish Duchies were torn from his kingdom by Germany, and England permitted the spoliation with a supineness that aroused Mr. Robert Cecil (later Lord Salisbury) to his highest flights of satire."

By the Danish Duchies you understand the Duchies of Holstein and Schleswig.

Permit me to suggest some remarks, the correctness of which may be easily ascertained.

(1.) The Duchy of Holstein is, and has always been, more thoroughly German than any other part or portion of Germany since the times of Hengist and Horsa of mythical fame. It has never been a part of Denmark. Under the Holy Roman Empire it was part of the Lower Saxon Circle or District; it was also included in the German Confederation established at the Congress of Vienna. It was connected with Denmark precisely in the same way as Hanover was with Great Britain. From George I. to the death of William IV. the electors and kings of Hanover were kings of Great Britain. From Christian I. till the death of Frederik VII., the Dukes of Schleswig-Holstein were kings of Denmark. As in England Queen Victoria succeeded to the throne under the laws of England, while under the Salic law prevailing in Germany the Duke of Cumberland ascended the throne of Hanover, so on the death of Frederik VII. Christian IX. succeeded to the throne of Denmark, while Duke Frederik of Schleswig-Holstein-Sonderburg-Augustenburg was called to the throne of Holstein and Schleswig under the laws of Germany prevailing in those old German provinces. The fact that Duke Frederik of Augustenburg (father to the present Empress) was euchred out by Bismarck, has nothing to do with this case.

(2.) The first King of Denmark of the Oldenburg line, Christian I. of Oldenburg, was also elected Duke by the estates of Holstein and Schleswig on condition that those two countries should remain united forever (*up ewig ungedeelt*). This fundamental law was broken in 1846 by Christian VIII. of Denmark, who, under coercion of the mob of Copenhagen, issued an open letter, in which he declared his intention to extend the law of succession in Denmark to his German Duchies of Schleswig and Holstein. For an answer, the estates of Holstein and Schleswig set up a provisional government of their own and took up arms in defence of their rights. They were defeated in the battle of Idstedt and turned over to the good graces of Denmark by the German Confederation. Schleswig was incorporated into Denmark by another *coup d'état* in 1863. Then followed the war of 1864, which settled the Danish claims for good.

(3.) That Great Britain was very anxious to prevent the establishment of an independent German state at the mouth of the river Elbe, and was even more opposed to the annexation of Schleswig and Holstein by Prussia, is well known. War was avoided only by the obstinate opposition of the Queen. The details are interestingly related in the Memoirs of the Earl of Malmesbury.

(4.) The high flights of satire on the part of Mr. Robert Cecil, later Lord Salisbury, show conclusively how little even better informed English statesmen of his period

cared for truth and fair play outside of their own national affairs. Nor did his sneering remarks, that the Germans had better save the Baltic provinces from Russian oppression, reflect much credit on his common sense. Courland and Livonia, though partly colonized by Germans some 800 years ago, have never been part of Germany; 90 per cent. of their inhabitants are of Slavic stock, while Holstein has always belonged to Germany and is inhabited only by Germans, and Schleswig at least by an overwhelming majority of the German race. As even divine Homer was sometimes caught napping, so we may assume that Mr Robert Cecil was half-asleep when he committed these uncommonly silly remarks to his diary.

(5.) The late King Christian IX. was not a member of the royal house of Denmark by birth, nor was he a Dane by blood or born in Denmark. He simply was one of the many German princelings without patrimony or expectations. His wife was a niece of King Christian VIII.; and since no heirs were born to Christian VIII. and Frederik VII., her husband of the Glücksburg line was designated to the throne of Denmark, after the late Grand Duke Peter of Oldenburg had politely refused to accept the honor. Neither the Queen of England nor the Empress Dowager of Russia was born a princess of Denmark; but fortunately very few people knew about it. Many of the troubles of King Christian IX. during the first years of his reign were caused by the fact that the most zealous Danes (mostly of the city of Copenhagen) were distrustful and opposed to him on account of his German birth.

Trusting that you will find these objections historically correct, I remain, with great respect, your faithful reader,

DR. E. SCHRADER.

1311 SPRAGUE AVENUE, SPOKANE, WASH., February 9, 1906.

NIETZSCHE'S WORKS IN ENGLISH.

TO THE EDITOR OF THE NATION:

SIR: Our attention has been called to an editorial on "The Function of an Endowed Press" in a recent edition of the *Nation*, in the course of which the writer adverts to the incident of the appearance of two volumes of Nietzsche's works produced by a London publisher. The late firm of Henry & Co. brought out two volumes of Nietzsche, and these were later taken over by Unwin, who brought out the third and fourth. In this country we publish these four volumes of translations of Nietzsche's works: 'Thus Spake Zarathustra: A Book of All and None,' 'A Genealogy of Morals,' 'The Case of Wagner, the Twilight Idols, Nietzsche contra Wagner,' 'The Dawn of Day.' It occurs to us that the writer of the editorial in question may perhaps be interested to know this; and if he and his friends will support us by buying the third and fourth volumes, we should be perhaps encouraged to go on.

Seriously, however, the point seems to be that enterprises of this kind to which the writer of the article in the *Nation* refers are undertaken from time to time; and that when they drop from the hands of one publisher they are apt to be taken up by another. Without going into particular instances, we think it may be said that a great deal of serious literature, including serious current literature, is published both here and in England at prices similar to those which are charged for current fiction. And while, of course, it is true that fiction has come to occupy a more prominent place in the public eye and on the book counters than serious literature, so that your editorial writer is entirely justified in suggesting that fiction and serious literature do not appear side by side and on equal terms, yet we have reason to know that the amount of serious literature which is bought and read throughout this country is entirely disproportionate to the amount of attention which its circulation attracts. We would venture to submit that the devotion of the American reading public to fiction, to the exclusion of more serious books, does not obtain to the extent which appearances would seem to indicate.—Very truly yours.

For the Macmillan Company.

HERBERT P. WILLIAMS.

NEW YORK, February 19, 1906.

THE "MEDUSA" OF THE UFFIZI GALLERY.

TO THE EDITOR OF THE NATION:

SIR: M. Corrado Ricci, the eminent director of the Florentine galleries, made an interesting announcement recently in the *Istituto Germanico* of Rome, which was reprinted in the *Marzocco* of Florence for December 17, 1905. It concerns the famous head of "Medusa" in the Uffizi Gallery, hitherto attributed to Leonardo da Vinci. M. Ricci observes that the spreading of error is generally more rapid and becomes more deeply rooted than that of truth. As a case in point, the splendid picture by Titian in the Borghese Gallery in Rome, representing "Venus and Medea," is still called in catalogues, photographs, and even in histories of art, by its false title of "Sacred and Profane Love." The so-called "Beatrice Cenci" in the Barberini Gallery is generally attributed to Guido Reni. Though it is proved that Reni did not come to Rome until several years after the beheading of the renowned Roman parricide, the legend of his painting the beautiful girl a few days before her death is too popular to be easily uprooted. Yet the canvas surely represents a Sibyl.

The authenticity of this "Medusa" of Leonardo had been already doubted. But an allusion of Vasari's and the persistent force of error have thus far carried more weight than technical, historical, or æsthetic opinions. Vasari speaks ('Vite,' iv., p. 32, Florence, 1879) of a hideous beast which Leonardo painted on the cross-section of a fig tree for a countryman, while our painting is square and painted on Dutch oak. That alone is sufficient proof that this is not the Florentine "Medusa" of which Vasari speaks. He writes also of another "Medusa" begun by Leonardo, but which remained unfinished, while that of the Uffizi is complete in detail and design. So neither of these two mentioned by Vasari can be identified with the Uffizi picture, and we can only conclude that all trace of them is lost.

But M. Ricci has found a very satisfactory solution to this vexed question. In an inventory of the "guardaroba ducale" of the end of the sixteenth or the beginning of the following century, one reads that the head of a Medusa "was presented to S. E. by the page of M. Philippe de Viq., etc. In a catalogue of 1769 the same picture is put down as a "Medusa in the Flemish manner." It is only in the following catalogue (1784) that for the first time the picture appears attributed to Leonardo da Vinci. From that date on, error flourishes, and we always find the picture appearing among Leonardo's works.

Even if these documents were not convincing enough, Italian artists always represented the Medusa full-face, while in the Uffizi picture the head is horizontal and in profile; all the hideous animals, so realistic, so carefully finished, reveal Northern ideas and treatment, and convince us that this head of Medusa in the Uffizi Gallery could never have come from the brush that gave us "la Gioconda."

UMBERTO GNOLI.

PISA, February 2, 1906.

Notes.

The second series of "Ancient Records," whose publication has been undertaken by the University of Chicago, is now issuing from its Press, viz., 'Ancient Records in Egypt,' by Prof. James H. Breasted of the University. It is first of the three contemplated, and the present volume is one of four to appear at intervals before July. An index will probably be supplied. Prof. Robert F. Harper's 'Ancient Records of Assyria and Babylonia,' and the late President Harper's 'Ancient Records of Palestine,' are still somewhat indeterminate.

The well-known articles on American history contributed by Alexander Johnston to Lalor's 'Cyclopædia of Political Science' have been arranged by Prof. James A. Woodburn of Indiana University in the form of a continuous narrative, under the title of 'American Political History, 1763-1876' (2 vols., Putnams). Of the worth of the articles themselves there is, of course, no question, and the work of the editor seems to have been, on the whole, skilfully performed. It is a pity, however, if the job was to be done at all, that some of the details should not have been more carefully attended to. A reasonable modification of phraseology, particularly in the opening sentences of articles, for the sake of better connection, could not have been objected to by the most exacting critic; but Professor Woodburn apparently has felt bound to follow his author literally, even when to do so produces such extraordinary results as those on pages 408-411 of volume two, where West Virginia bursts upon the scene. The numerous cross-references of the originals are here transferred bodily to footnotes, where, of course, they are both inappropriate and misleading, since the topics to which they refer can be found only by consulting the index. The original bibliographies, too, excellent in their day, ought certainly to have been revised and brought up to date, instead of being left for the most part twenty years behindhand; it is strange, for example, to find a list of authorities on the Bank controversy without a mention of Catterall's definitive work, or on the distribution of the surplus revenue without notice of E. G. Bourne's authoritative treatise. The statement (vol. i., p. 391)

that "there is no good history of the finances of the country in the English language" makes one wonder what Professor Woodburn thinks of Prof. Davis R. Dewey's volume. We note some avoidable misprints: Ferrand for Farrand (vol. i., p. 82), McDonald for MacDonald (vol. i., p. 269), and a double entry of Burgess's 'Reconstruction and the Constitution' (vol. ii., p. 478). The usefulness of the book in its present form will doubtless be considerable, and almost anything that will insure a wider acquaintance with Johnston's articles should be welcomed; but a separate collection of the articles in their original arrangement, with necessary revision and addition, is still, we think, a desideratum.

We had hoped to dilate upon the Atlas volume concluding Dr. Thwaites's grand publication of Lewis and Clark's original Journals (Dodd, Mead & Co.); but we perceive that we must give it up. It embraces the explorers' maps, almost wholly the skilful work of Clark, with some others carried out by the expedition, and with a general map of the entire route indicated on present-day political geography. There remains but one field of devotion for Lewis and Clark antiquaries, and that is a plotting of Clark's maps *at scale* on the maps of to-day. But it may be yet too early to do this, speaking cartographically.

Under the title of 'The Chief American Poets,' Curtis Hidden Page has edited for class use about six hundred and fifty pages of selections from Bryant, Poe, Emerson, Longfellow, Whittier, Holmes, Lowell, Whitman, and Lanier, with brief biographical sketches and copious reference to material for further study (Houghton, Mifflin & Co.). The declared aim has been to select the best from each author, representing, of course, the various phases of his work, and we find no glaring lapses of judgment to record, either of exclusion or of inclusion. As to Lowell, we raise the question whether critics and biographers are right in their total neglect of a poem which the author himself, shortly after its publication, referred to in a private letter as the best thing he had yet done. We refer to "The Fountain of Youth," of which Lowell's closest friend among the honored names of literary New England has been heard to say in recent years that it sprang from the deepest currents of the author's life.

Dr. Reginald R. Sharpe, Record Clerk in the City of London's Town Clerk's office, has issued, in his 'Calendars of Letter-Books' of the Corporation, a transcript of the so-called Letter-Book G, of which the date runs from 1352 to 1374. The reign is Edward the Third's, in which France and England were intermittently at war, with mutual invasions. The terminal year is that of Petrarch's death; and amid all the curious information, historical and customary, to be found in this volume and helpfully summarized in Dr. Sharpe's introduction, two items have a surpassing literary interest, remotely associated with the great Italian. One is the mention of John Chaucer, possibly the poet's father, as one of the ward collectors of a naval tax imposed on the city by the King; while the poet himself appears in the record of a lease to him of a tenement over Aldgate precisely in 1374. These items are not now first discovered or published, however. Nor is it new that the guilds, prototypes of our trade-unions, were in this period effectively directing that "no one, for instance, could follow the trade of fishmonger unless he became a member of the Guild, whilst no member of the Guild was allowed to meddle in any other trade." To this after six centuries have we reverted!

Halifax is a town in Plymouth County, Mass., which has never had more than 800 inhabitants, since 1875 has but once surpassed the population of 1765 (556), and last year sank to 497. By means of an "Old Colony Town Record Fund," the vigorous Massachusetts Society of *Mayflower* Descendants in Boston has just published the town's 'Vital Records' to the end of the year 1849, transcribed from five different volumes. For Barnstable County, using its special Fund, the Society has already published the 'Vital Records of Brewster.' The volumes are neat in appearance, and have been compiled with scrupulous painstaking. The proceeds of publication go to swell the respective Funds.

Whatever else it may be, Professor Nino Tamassia's latest book on 'S. Francesco d'Assisi e la sua Leggenda' (Padua: Fratelli Drucker) is altogether worthy of his deservedly high reputation for scholarship and research, while the subject chosen is such as to appeal to a far larger circle of readers than has been the case with any of his previous works. Indeed, the volume before us is one which no serious student of St. Francis and his times can afford to neglect. The thesis is revolutionary; but it is supported by a wealth of evidence which, if only by reason of its cumulative quality, acquires tremendous cogency and force. That the earliest and most authoritative histories of the Saint, from the 'Vita' of Tomaso da Celano to the 'Floretti,' are nothing but a *réchauffé* of still earlier myths; that the genesis of the legend of the Stigmata is neither miraculous nor pathological, but literary, being, in fact, traceable to the ἐγὼ γὰρ τὰ στίγματα τοῦ Κυρίου Ἰησοῦ ἐν τῷ σώματί μου βαστάζω of St. Paul; and that the wolf of Agobbio never really existed except in a symbolic sense, are a few among the many subversive opinions which are more or less openly maintained in these pages. Even M. Sabatier is vigorously assailed, and the whole story of St. Francis is cast into the melting-pot of ruthless critical analysis. Such a book may outrage our prejudices and run counter to all our preconceived notions; but it certainly cannot be ignored.

The *Library Journal* for January contains an article on "Special Libraries," by Mr. Robert H. Whitten of the State Library in Albany, describing the method of keeping extracts and clippings from periodicals in the Legislative Reading-Room at that library. Articles from some 500 engineering, medical, law, and general periodicals are extracted bodily, placed in manila envelopes, and filed in a classified arrangement with other pamphlets and manuscripts. Mr. Whitten argues that this method has decided advantages over the old method of cataloguing or indexing, which compels the inquirer to spend considerable time first in finding the references he wants, and then in waiting for the attendant to collect all the volumes he would consult, while "under the system under discussion he goes to the vertical file, picks out a handful of articles on the subject, selects the one or two desired, the whole operation occupying only a few minutes."

The January number of the *Printing Art* opens with an essay from the pen of Prof. Charles Eliot Norton, illustrated with several facsimiles, on the new so-called Humanistic type introduced by the University Press at Cambridge, Mass. This type is an attempt to revert, not to the early printers, but to *their* models, the scribes. Another article in the same number, by Mr. John Cotton Dana, deals with Library Printing, viz., of cards, bulletins, announcements, and that sort of thing. Mr. Dana shows, by a well-chosen selection of illustrations, how dignity and beauty can be obtained by the simplest means, by types accessible to the smallest printing-offices. The lesson is needed. Mr. Dana holds that libraries should "coöperate and even be leaders in the present forward movement in the industrial arts," and points out how they are able to bring lessons in beauty home to their readers through the printed matter which they distribute freely.

A list of over five hundred English standard works on Philosophy, compiled by Benjamin Rand, is given in the February Bulletin of the Boston Public Library. It consists of the leading histories and the works of and commentaries upon seventy-one philosophers. A noteworthy fact is that the largest number of titles is under Herbert Spencer, who is followed hard by Immanuel Kant. Current prices are annexed to most of the works in the list.

The *Annales de Géographie* for January opens with a discussion of the relations of the structure of the earth's crust to earthquakes. Observations of more than 170,000 show that they occur almost equally and exclusively along two narrow zones lying on two great circles of the terrestrial sphere: the Mediterranean or Alpine-Caucasian-Himalayan circle, with 53 per cent. of recorded earthquakes; and the circum-Pacific or Andeo-Japanese, Malaysian circle, with 41 per cent. These observations, it is asserted, give no support to the theory that the tetrahedral distortion of the earth's crust is due to this cause. Other articles are a summary of the facts, with a map, brought out by the first Russian census of 1897, in regard to the distribution of races and languages in the Empire; accounts of the cartography of French Indo-China, of the Kalahari desert in South Africa, and of the geology and glacial phenomena of the region of Jacobshavn, Greenland. Among the minor contents is a notice of a so-called French military mission for the purpose of discovering the best route from the Peruvian coast to the Amazon, and the progress of the rubber plantations throughout the world, but especially in the East. M. de Martonne describes the first inter-university geographical excursion. Students from eight French universities, under the direction of the professor of geography at Rennes, last summer studied the physical geography of Brittany. Languedoc will be visited by this year's excursion.

The *Globus* reports the details of a new German oceanographic expedition recently

sent out by the Naval Department of the German Government, the work to be carried on on the "Vermessungsschiff" *Planet*, a steamer of 650 tons. The vessel is to proceed northward of the Philippines to the Bismarck Archipelago, and, in addition to deep-sea measurements, the meteorology of those regions will be studied, especially the conditions of the higher strata by means of balloons. With a view to studying the coast outlines, stereophotogrammetry is to be utilized on a larger scale than ever before, and the same means will also be employed for the study of the size and shape of ocean waves. It has been decided that the *Planet* shall remain for a number of years thus employed in the western tropical regions of the Pacific Ocean.

The statistics of the census for 1905 are being gradually published by the German authorities. According to these reports, there are now forty-one "Grossstädte," *i. e.*, cities of more than one hundred thousand inhabitants in the Empire. This is eight in excess of the number in 1900, when the last census was taken. There are now five cities with over half a million inhabitants, as compared with two half a decade ago. These are Berlin, reporting 2,034,000 inhabitants; Hamburg, with 800,882; Munich, with 538,393; Dresden, with 514,283; and Leipzig, with 502,570. The most extraordinary growth is reported by Duisberg, which in the past five years advanced from 93,605 to 191,551, and Gelsenkirchen, which jumped from 40,500 to 146,742.

The Institute for Austrian History has begun the publication of a series of works that promise to be of exceptional value for the study of illuminated manuscripts. With the financial support of the Imperial Cultus Ministerium, successive catalogues are being issued to furnish scientifically accurate and illustrated accounts of the rich treasures of illuminated miniatures found in such abundance in the libraries of the Austrian Empire. The two opening volumes have made their appearance, the first being devoted to the Tyrol, and containing descriptions of 275 illuminated documents found in twenty-six libraries, cloisters, and museums; the second, entitled "Salzburg," contains an illustrated description of 126 such manuscripts, a goodly number being unique. Of special interest are the productions of the Salzburg schools of the eleventh, twelfth, and fifteenth centuries. Notwithstanding the fact that the Salzburg libraries were despoiled in favor of the libraries of Paris, Munich, and Vienna, an abundance of good material in this vein remains. Prof. Franz Wickhoff, who holds the chair of the history of art in the University of Vienna, is the general editor of the whole series, but each volume is being prepared by some specialist who is also a member of the Institute. Other volumes are to follow, covering the various provinces of the Empire. A special volume will treat of the manuscripts in the possession of the Imperial family.

Our London correspondent describes on another page the Workingmen's College founded by Frederick Maurice, apropos of its occupation of a new domicile, after patient waiting. We understand that, as is usual in such cases, the improved condition will involve a larger annual outlay for maintenance of building and of the staff of instructors. From thirty to fifty thousand dollars could be usefully added to the endowment, and some part of this may well come from Maurice's admirers in this country, or from sympathizers with his philanthropic foundation. Any such may send their offerings to the principal of the college, Prof. A. V. Dicey, 80 Banbury Road, Oxford.

A Paris reader writes: "An advertisement in your columns concerning the new monthly of the University of Chicago, the *Journal of Political Economy*, names among its board of advisory editors M. Paul Leroy-Beaulieu, who is stated to be a Senator. But he is not a member of the upper house, though he has more than once tried to be elected to the Chamber of Deputies; nor is either his brother or his son in Parliament. He is, however, a member of the Institute and a professor of the College of France—titles of the highest honor here."

—The symposium on "The Municipal Librarian's Aims in Bookbuying," in the *Library* for January, brings up again the moot question whether the function of libraries is strictly educational or essentially entertaining. An anonymous "Municipal Librarian" states very forcibly "The Educational Ideal: The Best and the Best Only"; while the editor's "Plea for Elasticity" presents the argument for the other side. These two articles were sent to a number of prominent librarians and literary men, in order to elicit expressions of opinion. Some of the replies are of unusual interest. Mr. Sidney Lee does not think "that public funds ought to be applied to the provision of such frivolous amusement as ephemeral fiction affords. . . . Municipal libraries constitute in my mind," he says, "a public danger if those who choose the books for them are content to echo the voice of the majority, or deem themselves under obligation to satisfy the demands of prevailing ignorance rather than to seek to counteract or diminish it." Mr. Sidney Webb, on the other hand, asks: "Why should not the citizens collectively provide themselves with recreative or amusing literature, if they choose, at whatever level of taste or culture they may have attained?" He does not think the question very important, but raises the more pertinent question "whether the librarians and members of library committees are doing all they can to make their institutions as useful to the community as possible." And he mentions, among the matters which library authorities might consider, the formation of local collections, and the selection of some one subject for each library to specialize on.

—Mr. H. W. Singer's 'Whistler,' in the Langham Series of Art Monographs (Scribner's), is a rather inconsequent little book, for which not a great deal in praise is to be said. The first twenty of the eighty pages of text are devoted to a discussion of Whistler's personality and his gentle art of making enemies—surely a liberal proportion—while six more pages, in the middle, are devoted to the hardly needed defence of art critics and to the exposition of Mr. Singer's own view that "the less the critic himself has painted or carved, the better it will be for him." He considers the fact that both Ruskin and "'Arry" Quilter were painters, a sufficient proof of the falsity of Whistler's (and Dürer's) doctrine that "none but an artist can be a competent critic." He hardly perceives the bearing on his own dictum of the fact that Whistler's writings seem to him worthy of discussion at length as "part of the gospel of the newer art criticism," and as the work of "a prophet of æsthetics" and "a divinely inspired oracle." His attitude is oddly compounded of personal antagonism and convinced Whistlerianism; but of any real analysis of the nature of Whistler's art he is incapable. "It is owing to the purely artistic character of these creations," he remarks, "that so little is to be said about them," and he has certainly found little to say. The only descriptive passages of importance are long quotations from Geffroy and Duret. Finally, the seeker of light on the real qualities of Whistler will get as little from the illustrations as from the text. With one or two exceptions, they are not well chosen, and, almost without exception, they are abominably reproduced.

—Under the general title "Epochs of Irish History," the firm of David Nutt is publishing a series of little books by Miss Eleanor Hull of which two volumes, 'Pagan Ireland' and 'Early Christian Ireland,' have already appeared. They are dedicated to the young students of Irish in a London branch of the Gaelic League, and are obviously intended for similar classes of readers. The style is therefore simple and popular—sometimes almost too condescendingly simple; yet the footnotes and occasional digressions bear testimony to the author's scholarly interests and particularly to her knowledge of folklore. The books contain a variety of information about ancient Ireland, the country and the archæological remains, the manners, customs, and beliefs of the people, and a sketch of their history. In these early periods the history is largely legendary, and Miss Hull has simply told the old stories as they were preserved in the native authors. Her selection of tales is good, and she has made use of the best modern editions and translations. She has also brought together a great deal of material which could not be found elsewhere, except in expensive works like Dr. Joyce's 'Social History of Ireland,' or O'Curry's 'Manners and Customs.' In general, the books seem to us well adapted to their purpose. Naturally one does not look in them for scholarly analysis of the old documents or for much discussion of their significance; and when the author does venture on such critical comment, it is usually not of much value. The question of accuracy in translation does not ordinarily arise, since Miss Hull is chiefly occupied with free summaries of the texts with which she deals; but it may be worth while to suggest one correction of this nature. The opening words of the Irish hymn ascribed to St. Patrick, should probably be rendered "I arise," and not "I bind myself."

—Many a reader of Dunlop's 'History of Fiction,' who has kept some small Latin from his college days, has doubtless wished for a first-hand acquaintance with that fund of mediæval story and fable which has given so much to French and Italian literature as well as to our own Chaucer. Such an acquaintance has heretofore de-

manded a university library, with time to browse therein. Prof. Jakob Ulrich has now sought to give, in small compass, specimens of the best of this mediæval fiction, 'Proben der lateinischen Novellistik des Mittelalters, ausgewählt und mit Anmerkungen versehen,' Leipzig, 1906. The editor has wisely refrained—a rare virtue in a German editor—from overloading his book with historical and critical notes, and of the 217 pages 208 are given up to the Latin text. He has thus been able to supply a surprisingly large amount of material. The collection opens with twenty-two pages of selections in verse, among which are included the "Snow Child," one of the three beast poems ascribed to Paulus Diaconus, the "Unibos," and eight out of the ten stories of woman's trickery by Adolphus of Vienna, one of which we find in elaborated form in Chaucer's "Merchant's Tale" of January and May. Of prose we have twenty-two stories from the 'Disciplina Clericalis' of the Spanish Jew, Petrus Alphonsus, which is the first example in Western literature of the Oriental story-within-a-story, and of which there exists a Norman version as early as the twelfth century. This is followed by twenty-two selections from John of Capua's translation of the 'Kalilah and Dimnah,' the introduction, which gives the framework, and eight stories from 'The Seven Wise Masters,' five from Dolopathos, forty-one from the 'Gesta Romanorum,' thirty-seven from the 'Exempla' of Jacques de Vitry, forty-three from Étienne de Bourbon, and some six pages from the Tours collection. The notes are unpretentious, consisting chiefly of references to Gröber's sketch of Middle Latin literature in his 'Grundriss,' to Benfey's 'Pantschatantra' and to the works of Dunlop, Clouston, Chauvin, Köhler, etc. Here and there we find a short indication of the later life of a story in modern European literature in a reference to Boccaccio, LaFontaine or Grimm. The book offers interesting examples of mediæval Latin style as well as of the genealogy of fiction. Moreover, these short-stories from the long ago—how long ago it were rash to say—will still prove amusing reading for one who reads his Latin with feet on the fender.

ALFRED RUSSEL WALLACE.

My Life: A Record of Events and Opinions. By Alfred Russel Wallace. Dodd, Mead & Co. 1905. 2 vols. 8vo, pp. 435, 464.

One of the scientific notables of the past forty-five years, a man to whom Darwin could write (and in substance often did), "I wish I had your power of arguing clearly" (vol. ii., p. 11), and that in reference to the very theory which his own radiant argument had illumined, must evidently be a spirit of no ordinary force; and his opinions, of which he has set forth a greater number than most scientific men find time to mature, make a more curious collection than all the rare birds and butterflies he sent home from the islands of the East, the famous Semioptera with its *panache* included. He believes in paper money as a standard of value, in national ownership of all the land, in Socialism, seemingly in astrology (ii., 335, *bis*), and unquestionably in full-blown spiritualism. If we are not mistaken, he is opposed to vivisection, as he emphatically is to vaccination, enforced or voluntary, to interest on money, to all inheritance and testamentary disposition of property. He scorns as utterly uncritical the modern scientific determinations of centres of psychical function in the cortex of the brain—not merely the work of Flourens, but also the later attempts of Broca, Munk, and others; and in this he is not so very far from the general opinion of students of the subject, who have at the most yielded but a hesitant and provisional assent to any one attempt to characterize the distinctive functions of the different regions of the brain. On the other hand, he warmly espouses the old phrenology of Gall and the bumps of the travelling lecturers of the forties. These paradoxes are defended by him with all the conviction of his reason, and more. He believes in all that he believes down to the very soles of his boots; and his arguments are mostly so surprisingly strong that some one of his works, say his 'Studies, Scientific and Social,' ought to be made the basis of a course of lectures on logic. Happy would be the university which should find itself equipped with a professor of logic really capable of dealing with his text.

As to Darwin's encomium, it does not stand alone. John Stuart Mill, Herbert Spencer, Sir Norman Lockyer, Huxley, John Fiske, Chauncey Wright—in short, almost everybody whose judgment concerning the logic of science had any particular value—have ranked Wallace among the past masters in scientific argumentation; yet his narrow training has rendered him an easy mark for whatsoever evil spirit there may be, personal or not, that beguiles men into sophistries, confusions, and rash assumptions, and it perhaps goes far to explain his willingness to serve as an instructor of the public on original lines in such a vast curriculum of subjects. He tells us (ii., 39) that he has "a positive distaste for all forms of anatomical and physiological experiment," and that he never even *saw* a dissection; nevertheless, biologists attach great weight to his conclusions about the distribution of animals, the classification of the races of mankind, etc. He has to have translations made for him from the German—and Malay, which he speaks fluently, will hardly be reckoned as an equivalent; but many a naturalist of good sense would doubtless be glad if he could exchange all his knowledge of German for half of Wallace's acumen in balancing scientific evidences. Wallace is an Oxford D.C.L., as well as an LL.D.; in this exceptional case the degree of D.C.L. really effected something, namely, it showed experimentally that, for all his paradoxes, even a university which is above all else *orthodox*, which would shiver at the bare idea of being *paradox*, or so much as paraclit to paradoxy, perceived that to "honor" Wallace in show would be to honor herself in deed. Bearing all these things in mind, and knowing well that Wallace never wrote a dull line in his life, and couldn't if he tried, his very tables and diagrams being as entertaining as they are valuably instructive, our reviewer, we will answer for him, was not a little curious to read this autobiography and to discover what schooling of child and man had produced this conglomerate personality.

In 1823, George IV. being King of England, Louis XVIII. of France, on the eighth day of the year, Alfred Russel Wallace was born two miles from the north bank of the Severn, at Usk, on the river Usk. He was named after a Mr. Richard Russell, and we learn that the reason why he always spells his middle name with one *l* is that, after the christening, the parish clerk, who was no great speller, so wrote it in the register! No more inexplicable case of "psychic influence"—and it has lasted for eighty-three years—is told of in the spiritualistic chapter, although Home and Stainton Moses figure there. He came of virtuous Church-of-England middle-class stock, not at all sordid or vulgar. His father, having a competency at first, did not practise his profession of attorney, and, by his ignorance of law and business, gradually sank into extreme poverty. When Alfred was about six, the family moved to Hertford, and, after a year or two of teaching by his father, he went to the public grammar school, where he learned nothing but the nomenclature of geography, chiefly of English towns, and above all the Latin grammar; and this is the only schooling (in the narrow sense) that he ever had. The vestiges of some knowledge of Latin still appear, now and then, in his sentences, especially in constructions that are bad in a language in which the order of succession of the words is the only clue,* as well as in the frequency of "I and brother William," "I and my wife," "I and Mr. Mitten" (vol. i., pp. 246, 247, 251, 337, 339; ii., 49, 61, 238), though in the accusative it is "my brother and me" (i., 256). More than once in this book he deplores an incapacity for language which he attributes to himself. But, as to this, it is necessary to distinguish between a natural incapacity and early want of facility due to one's self-communions not having been such as to exercise one's faculty. We take leave to doubt any lack in him of the faculty itself, for the few facts at our disposal rather point the other way. Thus, his description of his school life shows that he was anything but industrious; yet he gained enough Latin to pick out the sense of the Æneid, and no doubt to parse the sentences. Later he found it "very easy" to learn Malay; and although that language is, as he says, of the simplest construction, especially the dialect of Sumatra, with which he presumably began, yet it may be doubted whether any grown man whose capacity for language was decidedly defective would have been so particularly struck with the facility of the task of learning it. So, during his sojourn in Wales, he greatly enjoyed the Welsh church services; he enlarges upon the beauty of this ancient tongue, which is quite noticeable for its various modifications of its words, and he praises the elocution of the preacher in a way that implies that he followed the speech, word for word, though it was only a Sunday recreation for him. But the evidence we most rely upon is his own remarkably lucid, easy, and harmonious style of writing; remarkable, we mean, in comparison with that of others who, like him, have never received any instruction in rhetoric. With little opportunity to compare his own

*For example: "Before leaving Singapore I wrote a long letter to my old fellow-traveller and companion, Henry Walter Bates, then collecting on the upper Amazon, almost wholly devoted to entomology and especially giving my impressions of the comparative richness of the two countries." This is far from being one of Wallace's worst sentences; but it illustrates the Latinity (i. 349),

performances with those of other unpractised writers, he would at first naturally judge of his own talent by the effort it cost him to express his ideas, although this effort must have been largely due to want of habitude. His self-estimation was further influenced, no doubt, by the grade-numbers that two itinerant phrenologists had assigned to his bumps of language.

At the age of fourteen his school days were brought to a close, and after a few months he joined his eldest brother, who was a surveyor. Alfred took very kindly to this business. The alternation of outdoor and indoor work was greatly to his taste, and the mathematical ingredient attracted him strongly. This is deeply graven in his correspondence. The disposition he has shown through life to express himself in maps and diagrams, together with his love of regularity and order, may incline us to think that Wallace is one of the mathematical class of thinkers. Meditation is dialogue. "I says to myself, says I," is the vernacular account of it; and the most minute and tireless study of logic only fortifies this conception. The majority of men commune with themselves in words. The physicist, however, thinks of experimenting, of doing something and awaiting the result. The artist, again, thinks about pictures and visual images, and largely in pictured bits; while the musician thinks about, and in, tones. Fiually, the mathematician clothes his thought in mental diagrams, which exhibit regularities and analogies of abstract forms almost quite free from the feelings that would accompany real perceptions. A person who from childhood has habitually made his reflections by experimenting upon mental diagrams, will ordinarily lack the readiness in conversation that belongs to one who has always thought in words, and will naturally infer that he lacks talent for speech when he only lacks practice.

Another part of Wallace's education that must not be altogether forgotten consisted in his spending nearly a year in a silent and contriving trade, that of the watch-cleaner and jeweller. But circumstances carried him back to surveying, and just then the railway fever rose to such a heat that surveyors commanded high pay; so that, though we may be sure that he would not have had the audacity to obtain what some others would, yet in six months he laid up £100. This being increased by a legacy of £50, he was enabled to join his friend, Henry Walter Bates, in a voyage to Pará. Some years earlier, he had become deeply interested in botany; and more recently Bates had drawn him into a passion for beetles and butterflies. Before sailing, he had had the great good luck to secure the services of Mr. Samuel Stevens as his London agent. He remained on the Amazon, Rio Negro, and Uaupes through four years, dispatching collections to Mr. Stevens just sufficient to pay his expenses. On his return voyage he took with him more, to the value of £200, astutely calculating, we may presume, that if he himself got safe to England, so would they. It fell out otherwise. The ship took fire. Wallace was miraculously rescued, and saved only his life and a few sovereigns. The trusty Stevens, however, had of his own motion insured the specimens for £150, and lo! this was paid. He now wrote and published two books, which just paid the printer, the *time* being a dead loss, from a monetary point of view. He next desired to go collecting in the Malay Islands, and, after much difficulty and delay, Government, at the instance of Sir Roderick Murchison, who was no ordinary scientist, but a swell, presented him with a first-class ticket overland to Singapore.

Wallace remained in the Malay Archipelago for eight years, studying the living forms in the forests of the chief islands and many smaller ones. He was thirty-one when he went, thirty-nine when he returned. Those years were passed in intellectual solitude. All that time he hardly spoke except in Malay, a language without abstractions, comparatively. His only constant servant was a native picked up on the north shore of Borneo. That such a life must bring a great but dangerous education to a young man we may be sure. He came home even more ignorant of how to steer his bark than he went out. He had gone for no better reason than that he was captivated by the accounts of the fauna and flora. He had not the slightest idea that he was going to the one country where a collecting naturalist could gather a fortune in specimens. Before he returned, he committed the folly of sending home a paper giving the theory of natural selection, and defending it. Was he a duke or a millionaire, that he could afford to shock every right-minded man with such a theory, whose enormity was aggravated by its being pretty evidently true? Perhaps he thought it his duty to mankind, though mankind decidedly thought not; yet even when he learned that Darwin had long had in hand a great work to the same purport, he had not the common sense to suppress his own book, and sink it deeper than ever plummet sounded. His conception of Natural Selection (at least, as he now holds it) is superior to Darwin's, in that he maintains that variation in every character of every form is so great in every generation that the vast majority of the young are destroyed without reproducing; so that a new species could be established in a century, if changes in the environment were rapid enough to call for such swift transformation. Of course, such variations exist.

Returning to England, he found he had earned a competence. Let him keep still, leave mankind to shift for itself, and distrust his own potential folly, and a happy life was before him. Alas! his ignorance of the world and want of appreciation of that ignorance were such that ere long the savings were evaporated, and he found himself in the desperate condition of having to live on his pen. Still, even then, had he written what was most conservative and indisputable, carefully concealing his original power, he might doubtless have obtained an appointment to a position where he could give carefully measured vent to his genius. But, perhaps feeling that he had not been put into the world for that, he preferred defending startling hypotheses that are not of a nature to be verified or disproved by decisive experiment. The result naturally was to press him more and more into byways of thought, diverging constantly further from the sober conservatism of worldly interest. Far be it from us to blame the veteran naturalist whose paradoxes have been so instructive to us. But it concerns us to understand how he came to develop as he did, since several of his arguments must derive much of their weight with the general public from the high scientific standing of their author; and two of the most impressive chapters of the present volumes are calculated and partly intended to produce momentous changes of the reader's opinions largely by force of the confidence he will have come to place in the author's power of eliciting the truth of the matter to which they relate.

We repeat that Wallace is a great scientific reasoner; and of course this implies that he is perfectly fair-minded, and sincerely anxious to do full justice to that side of each question which he combats. We may add that, where he differs most from received opinions, his arguments are in general the most carefully considered and consequently the strongest. Certainly, his argument against vaccination, as it is presented in his 'Studies,' is extremely strong. The presentation of it in his 'Wonderful Century' has been more admired by lawyers, but its force is too much directed against refuting his opponents rather than to studying the facts of the case.

The spiritualistic experiences detailed in the second volume of 'My Life' simply cannot be read by any person of open mind without producing a strong impression. But the author admits that the impressive phenomena come very rarely; and when we turn to such a book as Arthur Lillie's account of his friend, the Rev. William Stainton Moses, who was probably in all respects that one of the powerful mediums who most inspires confidence, and there see in what an ocean of incredible nonsense the manifestations are swamped, we ask ourselves whether it is possible for anybody to hold his attention long upon such dire rubbish without great danger of being thrown into such an abnormal state of mind that his testimony may perhaps be no better than that of a person in an hypnotic trance. At any rate, it is the most unwholesome nutriment for the mind, and we are glad that Mr. Wallace did not long continue his active interest in it.

His Socialistic doctrine, which seems to be of a variety peculiar to himself, rests wholly upon a definition of justice as requiring that every child shall have, in every respect, an opportunity precisely equal to every other's. He seems to think it an axiom that such justice ought to be carried out. It is a kind of justice singularly at variance with the dealings of nature with individuals. It could only be remote from viva-voce criticism and discussion that such a proposition could in his mind be metamorphosed from being a thing impossible to believe to being a thing impossible to doubt.

To sum up, this is certainly a very entertaining book, highly instructive in several distinct ways. The volumes are very attractively clothed, and there is au index of near fifty pages.

THE AMERICAN NATION UP TO '89.

Preliminaries of the Revolution, 1763-1775. By George Elliott Howard. [The American Nation, vol. viii.] Pp. xviii., 359. Harpers. 1905.

The American Revolution, 1776-1783. By Claude Halstead Van Tyne. [The Ameri-

can Nation, vol. ix.] Pp. xix., 369. Harpers. 1905.

The Confederation and the Constitution, 1783-1789. By Andrew C. McLaughlin. (The American Nation, vol. x.) Pp. xix., 348. Harpers. 1905.

The two volumes of Professor Hart's "American Nation" series which deal with the period of the Revolution will doubtless prove, to many readers, the most interesting volumes yet issued. In amount of matter and in general scope they naturally suggest comparison with the well-known work of John Fiske, but there is little besides the title in which the two works accord. In purely literary interest, and in the sure feeling for what is effective or dramatic in historical events, Fiske's superiority is unquestionable; but in just balance and proportion, in thoroughness of research, and in all-round attention to the various aspects of the subject, the volumes before us are far better, not only than Fiske's work, but also than any other account of the American Revolution of equal compass.

The distinctive character of the work of Professors Howard and Van Tyne will appear from an enumeration of the topics which the authors have included in their account of the Revolution, but which other writers have either omitted altogether or treated scantily or incidentally. Thus, Professor Howard begins with chapters on the Seven Years' War as "revealing an American people," on the British Empire under George III., and on the mercantile colonial system. A clear and unusually full account of the Stamp Act and Townshend Acts prepares the way for a discussion of episcopacy as a cause of the Revolution. The episcopal motive, first strongly urged by Mellen Chamberlain in his essay on John Adams, proved a prolific raiser of doubts to historians until Dr. Arthur L. Cross examined it in his 'Anglican Episcopate and the American Colonies.' Professor Howard adopts Dr. Cross's conclusion that "the strained relations which heralded the War of Independence strengthened the opposition to episcopacy, rather than that religious differences were a prime moving cause of political alienation" (p. 221). Of the remaining chapters, those on institutional beginnings in the West and on the early treatment of the Loyalists are the most distinctive.

Professor Van Tyne, who takes up the story at the outbreak of hostilities in 1775, prefaces his account with a summary review of the ground covered by Professor Howard—an instance of needless overlapping which this series for the first time presents—and then proceeds with a narrative in which purely military events are subordinated and attention centred with unusual directness on the civil history of the States and the work of the Continental Congress. On the subject of the Loyalists, and in general on the relations between Whigs and Tories, the author is an authority, and his treatment of the matter in the present work is of a high order. Both volumes are, as usual, well furnished with maps, while the bibliographical chapters survey the principal literature.

From the numerous interesting points which these volumes present, we select two only for brief special comment. The first is as to the light which the writers, particularly Professor Howard, have thrown on the vexed question of the cause of the Revolution. Speaking broadly, one may say that historians have tended to emphasize the political aspects of the early Revolutionary struggle, and to point out that it was apprehension rather than grievance that drove the colonies to revolt. The trouble with this theory is that it too much disregards the economic situation in America, and appears less conclusive the more the economic situation is revealed. On this fundamental point Professor Howard does not seem to us entirely clear. He tells us (pp. 64, 65), speaking of the old colonial system, that although the system as actually administered "did not prevent the great material prosperity of the colonists," and though "even the harsh restraint of manufacturers was quietly accepted," yet the system is nevertheless to be "regarded as the primary cause of the Revolution," for the reason that "it was wrong in principle and degrading in motive."

We have to confess to finding this confusing. It would be difficult to instance a social upheaval at all comparable to the American Revolution which was brought about by revolt against a system, of which one could only say that it was "wrong in principle and degrading in motive." If the restrictive system actually interfered but slightly with the prosperity of the colonies, one can but wonder why the colonies revolted at it. The case seems to be, rather, that the Americans were poor, that they profited much less than has commonly been supposed from the lax enforcement of the trade laws, and that under the restrictive system there was small chance of accumulating either capital or wealth. When, then, the Sugar Act, the Stamp Act, and the Townsend Acts undertook to take money from America directly, in addition to what had previously been exacted indirectly, the people rebelled because they could pay no more. In other words, the American Revolution, like other revolutions, shows how the political motive—naturally the one to be emphasized to the world at large—waits on the economic motive and then supplants it. Professor Howard has given us an admirable survey of the political side of the early Revolutionary period, but he has not, we think, sufficiently shown how the low economic development of the colonies, and the consequent inability of the people to pay greater tribute to the mother country than they had long been doing, bred certain revolt when pressure grew too great, and afforded the indispensable basis for political agitation from 1770 to 1775.

The second point is suggested by Professor Van Tyne's discussion of the relation of the States to the general Government under the Continental Congress. Of the many prepossessions with which the study of American history has been approached, none has come to be more dominant than that which ascribes to the United States, as against the States, the possession of sovereignty, and that, too, from the beginning of federal union. The theory has the support of great names. It has been employed for the triumphant vindication of the national as opposed to the State-rights view of the Constitution. It is the accepted opinion of the Supreme Court. It has never, indeed, satisfied historians. President (then Professor) Woodrow Wilson challenged it, a dozen years ago, in his 'Division and Reunion,' and made no small stir by doing so; for his statement that "the doctrine that the States had individually become sovereign bodies when they emerged from their condition of subjection to Great Britain as colonies, and that they had not lost their individual sovereignty by entering the Union, was a doctrine accepted almost without question, even by the courts, for quite thirty years after the formation of the Government" ('Division and Reunion,' p. 45), appeared to not a few legalists to justify the essential positions of Hayne, Calhoun, and all the rest of the State-rights leaders.

Professor Van Tyne, writing as an historian, rather than a lawyer, has tested the theory by the facts so far as the origin of State and national Governments is concerned, and with the result of showing, we think with near approach to conclusiveness, that the notion of national sovereignty and State subordination, however inevitable as a constitutional theory later, has in the Revolutionary period only a slender historical foundation. If anything is clear beyong cavil from Professor Van Tyne's imposing array of evidence, it is that the States, throughout the Revolution, were practically independent sovereignties, acting together, it is true, for the attainment of certain common ends, but surrendering none of their sovereign powers in so doing. This is not the place to indicate the bearing of Professor Van Tyne's conclusions on the subsequent constitutional development of the United States. It will certainly be interesting to see how far later writers in the "American Nation" series agree with him. It may be pointed out, however, that his findings have marked significance for the constitutional discussions of the first thirty years of the constitutional period, that they give a new meaning to Webster's great victory over Hayne, and that they afford food for thought in our own day, when the federal powers are undergoing such extraordinary expansion.

In his editorial introduction to Professor McLaughlin's volume, Professor Hart observes that, notwithstanding the familiar designation of the years from 1783 to 1789 as the "critical period" of American history, it nevertheless "seems doubtful whether it was really a time of such danger of national dissolution as people then and since have supposed." We question if a careful reading of this volume will materially dim the impression of the period as one of grave crisis and serious public danger, but there will be general accord with Professor Hart's further observation that the work tends to show "a more orderly, logical, and inevitable march of events than has commonly been described." The book is, indeed, an important contribution to our knowledge of an obscure and little-known period, and may be expected to become the recognized authority, in moderate compass, on the events with which it deals.

The fundamental problem of the period, as Professor McLaughlin views it, was that of imperial organization. Out of the varied elements afforded by thirteen different communities was to be formed, if possible, a national government. Those communities, though forming from north to south a continuous line, were extensively dispersed,

They had had diverse origins, and were still, at the end of a joint war, widely different, not only in natural resources, but also in the character of their people, in their local political institutions, and in their ambitions and hopes. Jealous of one another, they were still more jealous of any central authority that should attempt to control them; for they had fought a long and costly war against imperial authority, and were little disposed to replace one *imperium* by another. Yet it was equally clear that their prosperity, if not, indeed, their independence, hung upon union. The problem was the reconciliation of these opposing forces, the harmonizing of these apparently irreconcilable differences. That the people of the United States should have succeeded, in the short space of seven years, in constructing a "new roof" under which all could eventually gather, and which, with some extensions and alterations, serves to-day better even than it served then, is one of the marvels of modern history.

This is not the place to comment in detail on the numerous points on which Professor McLaughlin's researches throw new light, or in regard to which he has summarized with skill the conclusions of others. The narrative begins with the last military operations of the war, and ends with the ratification of the Constitution by the States. One notices throughout, in the discussion of diplomatic questions, the favorable attitude towards Jay, whose career as a diplomatist has hardly received due appreciation at the hands of scholars. On the much-debated question of the attitude of Vergennes during the peace negotiations, Professor McLaughlin, while recognizing Jay's "admirable boldness" in taking heavy responsibility before the arrival of Adams, reaches also the cautious conclusion that Jay was "somewhat too suspicious of France," that "there is as yet no evidence that [Vergennes] had much at heart the limitation of America's terrltory," and that Franklin, who had laid the plans for the negotiations, would not "easily" have "surrendered any of the American claims" (pp. 31, 32). A similar friendliness towards Madison appears in the account of the Federal Convention and elsewhere. May it not be that the exceeding value of Madison's 'Notes' has led to some overestimate of his actual influence in shaping the Constitution, and that there were other members of the Convention—for example, Oliver Ellsworth—whose influence has not yet been given due weight?

The diplomatic relations of the United States between 1783 and 1789, especially those with Spain over the navigation of the Mississippi, are skilfully traced, with severe but merited condemnation of Wilkinson for his shady intrigues. There are informing, though brief, chapters on the organization of the Northwest Territory and the founding of new Western commonwealths, though both the Ordinance of 1787 and the public-land system would seem to merit a more extended treatment. The harsh handling of Loyalists after the peace, the disastrous experiments of States and nation with paper money, and Shays's rebellion are other main topics to whose better understanding the volume makes more or less significant contributions. If Professor McLaughlin's work were designed for a textbook, it would quite certainly not find favor in Rhode Island, for in no recent work which has come under our eye have the early financial vagaries of that commonwealth been more roundly scored.

About half of the volume is devoted to the formation and adoption of the Federal Constitution. As a clear and orderly account of events, from the first proposals to alter the Articles of Confederation to the enthronement of the Constitution as the law of the land, the chapters leave little to be desired; for while the detailed story of a constitutional convention can hardly be made entertaining, Professor McLaughlin does write interestingly and handles facts skilfully. At one important point, however, we think his narrative incomplete. No writer, so far as we recall, has yet given an entirely satisfactory explanation of the speedy and marked success of the Constitution and of the government under it. The usual explanation has been, of course, that the Constitution was superior to the Articles of Confederation; and writers have vied with one another in pointing out the defects and weaknesses of the earlier instrument. Professor McLaughlin, it should be said, does not share this view; on the contrary, he is of the opinion that the Articles "were in many respects models of what articles of confederation ought to be, an advance on previous instruments of like kind in the world's history"; and that "their inadequacy arose from the fact that a mere confederacy of sovereign States was not adapted to the social, political, and industrial needs of the time" (p. 49).

A complete answer to the query as to the reasons for the success of the Constitution would take us outside the chronological limits of Professor McLaughlin's book. What, however, the author has not brought out with sufficient clearness is the economic preparation for the Constitution in the revival of trade, manufactures, commerce, agriculture, and the fisheries during the last years of the Confederation. He gives us, to be sure, two chapters on commercial and financial conditions, but the narrative stops with 1786, thus largely dropping out of sight the economic activities of the United States for the three years immediately preceding the inauguration of the government under the Constitution. There seems to be reason for believing that, while the Articles of Confederation became discredited because of the wretched condition of the country in 1781 and immediately thereafter, they might very possibly have worked fairly well for some years after 1787 had not the demand for a "more perfect union" fortunately reached a climax at that time; and that the adoption of the Constitution, coinciding as it did with a return of prosperity, ensured for that instrument a success which otherwise might well have been partial and delayed. Professor McLaughlin's presentation of the political history of the Confederation period is, as a whole, of such merit that we can but regret that he has not ploughed more deeply in the economic field.

Irish History and the Irish Question. By Goldwin Smith. McClure, Phillips & Co. 1905. Pages 270.

A history of Ireland from the earliest times, compressed into less than 200 pages, must necessarily be little more than an imperfect sketch, however skilfully the compression is made. Professor Smith's account is concise to a degree that is actually misleading. Excessive compression may account for his very positive statements of facts not clearly known, for his explicit descriptions of ancient customs, of events shrouded in the mists of ages, of ancient laws which the most learned antiquarians have hesitated to speak of positively. Examples are his description of tribal land tenures; his statement that "there seem to be no remains clearly Druidic in Ireland," though the numerous cromlechs and stone circles for which Ireland is so remarkable are usually held to be Druidic, and Druids are specifically mentioned in ancient legends. Topical nomenclature, too, seems to attest their existence.

The rapid sketch of the chief events of Irish history does not profess to be founded on any original research or independent study. It is a brilliant and lucid recital of well-known facts, of many incidents that are well known not to be true, or that are at any rate doubtful. The story is throughout strongly tinged with Mr. Smith's own views, which are markedly anti-Irish and anti-Catholic, and is plainly used as a peg on which to hang his opinions on the "Irish question," *i. e.*, the present state of Ireland, and the causes of the lamentable decay, poverty, and depopulation we are now witnessing.

With surprising frankness, shall we say? Mr. Smith tells, in his preface, what opportunities he had for forming these opinions. He spent a summer forty-six years ago in Phœnix Park as guest of Chief Secretary Cardwell, and there "had the advantage" of discussing the Irish question with "such friends as Lord Chancellor O'Hagan, Robert Lowe, Sir Alexander MacDonald, and other Irish Liberals of the moderate school"; he visited Maynooth College and "conversed with its excellent principal," and, some years later, when attending the Social Science Congress, was the guest of Lord O'Hagan in Dublin. His confidence in the wisdom of his Irish friends and instructors has remained unshaken, or rather has been strengthened by the course of events.

The view that "the sources of Ireland's sorrows are to be found in natural circumstance and historical fact rather than in the crimes and follies of man," is sufficiently refuted by the grim facts of history as sketched by Professor Smith. That "interest of every kind seems to enjoin the union of the islands" is a somewhat vague statement which suggests the questions, Whose interest? and, What kind of union? The government of Ireland as a subordinated and conquered country by England has never been what could be called a union. After describing the horrors of the famine and accompanying pestilence, the savage clearances and heartless evictions, the consequent dire suffering and misery, Mr. Smith says: "Civilized Europe could show nothing like it. It was enough to break forever the spirit of the nation, . . . and here the main cause was *misgovernment and bad law.*" According to current English ideas and those of the mild Anglo-Irish reformers of 1860, in whom Mr. Smith places his confidence, Ireland was and is by nature a grazing country; destined to pasture; un-

suited to tillage"; "overpopulated"—"the people priest-ridden"; "early marriages encouraged by the priests, perhaps not without an eye to fees"; the people prone to commit causeless outrages, for which repression by continual Coercion Acts is the only remedy unless Government abdicates. These ideas are still current among some Englishmen, and are apparently held by Mr. Smith. When it is shown that there is much less crime in Ireland than in England, the usual answer is that if there is not overt crime, the country reeks with "sedition," *i. e.*, discontent—a mental crime.

Mr. Smith is very convinced and positive on the subject of overpopulation. It is still a question with him whether Ireland can support her present population of 4.4 millions. Speaking of the early part of last century, he says: "The millions had gone on multiplying with animal recklessness." "Between 1801 and 1841 the population had increased by three millions." Whether such increase is reckless, can be judged only by comparison with other countries. No census was taken in Ireland until 1821, but the accepted estimate of population in 1801 was 5,395,000. In 1841 the population was 8,199,853, an increase of 54 per cent. During the same period in England the increase of population was 77 per cent., and in Scotland 63 per cent. Between 1821 and 1841 the increase in Ireland was 20 per cent., while in England it was 33 per cent. Even before the famine, Ireland showed that tendency to a low birth-rate which has since increased and been the wonder of all vital statisticians. If the Catholic priests have inculcated early marriages, they have been singularly unsuccessful in Ireland, for the marriage-rate has for more than fifty years, during which it has been under observation, been exceptionally low as compared with other countries. Bertillon, in his 'Cours de Statistique,' says: "En Irelande, la proportion des femmes mariées est extrêmement faible, et de plus elles ne sont pas plus fécondes que celles de Suisse."

With regard to the alleged influence of the Catholic priests in politics it may be noted that they have openly opposed every popular movement during the last century, but after a time they had to follow the people; they were led rather than leaders. As a body they opposed the 1848 uprising; they gave information to the Government of the abortive Phœnix conspiracy; they denounced the Fenian and Land League movements. Yet the leaders of these movements have been those whom the people still delight to honor. The convicted rebels John Mitchel and O'Donovan Rossa were elected to Parliament in spite of the priests. "No priest in politics" became a watchword in some districts. "We will take our religion from Rome, not our politics," was the repeated declaration of the National League leaders. In Home Rule elections Protestant Home Rulers defeated Catholic candidates supported by the clergy. In the face of such facts, what meaning is to be attached to the term "priest-ridden"? Equally unsupportable is the allegation that the priest has "discouraged and thwarted the extension of popular education." The Catholic clergy have covered the most desolate parts of the country with schools, nearly all of which are placed under the control of the National Board of Education, on which, in proportion to their numbers, the Catholics are very inadequately represented. Educational experts sent from England to report on the Irish schools have found the most efficient to be those managed and taught by nuns and Christian brothers.

One of the most striking misconceptions is with regard to the objects of the Gaelic League, which Mr. Smith trusts will "hardly carry its patriotism so far as to darken its mind by unlearning English." Again, it is stated that the office of Lord Lieutenant has been retained only in deference to the wish of Ireland. This is a subject on which public opinion has not been expressed for some years, but the published constitution of the National League stated one of its objects to be "the abolition of the office of Lord Lieutenant of Ireland." For a final criticism, Ireland "received," says Mr. Smith, "the boon of national and undenominational education a generation before England." Now the primary schools in Ireland are called National schools, but education is neither universal nor compulsory. It is strictly denominational, to such an extent that where the population of any locality consists of different religious sects, each may have a separate school. Thus, besides a Protestant and a Catholic school, there may be also a Presbyterian and a Methodist school in the same district—four bad schools in mean buildings in place of one good school with efficient teachers and suitable appliances.

Mr. Smith draws a gloomy picture of an independent Ireland, "severed from Great Britain"; but no representative politicians propose, or ever proposed, such a severance as he contemplates. The importance of the Irish question, on the other hand, he recognizes in his concluding sentence: "What far-off object of aggrandizement can be half so important as a contented and loyal Ireland?"

Impressions of Japanese Architecture and the Allied Arts. By Ralph Adams Cram. New York: The Baker & Taylor Co. 1905. Pp. xi, 227.

Arts and Crafts of Old Japan. By Stewart Dick. Edinburgh: T. N. Foulis; Chicago: A. C. McClurg & Co. 1905. Pp. 153.

Mr. Cram's book contains fifty-two half-tone prints in brown. There are landscape subjects, such as Plate I., "Lord Fuji," that is to say, Fuji-San, or Fujiyama, and Plate LII., "A Vision of Fujiyama." There are also subjects of mingled landscape and human art, as in the distant and nearer views of buildings seen with their surroundings, such as Plate XXVI., "Narita Steps," Plate XLI., "A Farmhouse," with Fuji in the background, and Plate XVIII., "A Torii," with lake and mountain beyond. Then there are views of buildings, selected with special regard to their architectural character, such as Plate VI., the "Yakushiji Pagoda," the same picture as that given in the illustration to this author's article on Japan in the 'Dictionary of Architecture and Building.' The argument as to the supreme excellence of this pagoda is hard to follow without other photographs, taken, moreover, from other points of view for comparison's sake. Other such pictures are those of the Ho-o-do at Uji, Plates VII. and VIII. This building also is given and considered by Mr. Cram in his Dictionary article named above. It is therefore evident that these buildings are selected by our author with special regard to their supreme importance in the history of architectural art in the Far East. For, it must be said here, Mr. Cram's assumption is that the beauty of curve in the overhanging and ribbed roofs of these pagodas is the chief thing in their design, or in the external architecture of Japan. Now such refinements are out of the way in all modern European designing, and are only slightly affected by the great styles of the past—by that of the earlier Renaissance, by Greek art in its prime, by the most advanced period of the Romanesque; while the creators of great building styles, Egyptian and Gothic, for instance, were too busy to care supremely for subtleties of curve and slope. Hence most designers in architecture live and die without any aspiration toward such exquisiteness of curvature as Mr. Cram finds in those early existing wooden towers of Japan. So with the sanctuary at Uji named above, the terms used in connection with it are such as these—"the almost inconceivable grace and dignity of this unique building," "this wonderful building," "exquisite as this building is from without." And if we quote these strong words of praise, it is with the single purpose of explaining to the reader what kind of a book he has before him. It is the work of a man who finds perfected Japanese designs as nearly supreme as any decorative art in the world can be. He says (p. 81) that- "Japanese architecture is at first absolutely baffling, ... so utterly foreign, so radically different in its genesis, so aloof in its moods and motives from the standards of the West." It is shown with perfect truth and with suggestive touches that the training of the European mind has been on wholly different lines, and that though we can "think forward in the terms of the West, we can hardly think backward in the terms of the mysterious East."

For good and for evil, then, we have a book of extreme subtlety of thought, which is increased by the strongly religious turn that all Mr. Cram's reasoning is apt to take. In the second page of the text (p. 16) there is reference to divine revelation, and the whole of the first chapter is composed with an overhanging sense of the direct divine inspiration of human enlightenment. The reader may confess to an imperfect understanding of the argument on page 22, as to the small influence of the successive religious creeds or practices upon the immutable civilization of Japan; but the critical tone of that first chapter is faultless, and it is well for every student of the subject to read it over more than once before undertaking the severely abstract reasoning of Chapter II., which deals with the early architecture of Japan.

Chapter III. treats of the later architecture of the country; Chapters IV. and V., of temples and shrines and temple-gardens; Chapter VI., of domestic interiors; three chapters still, of sculpture and portable works of decoration, while the tenth and final chapter is a rather hopeless forecasting of what may perhaps come to replace the presumably dead art of Old Japan by a new art of their own, not to be confound-

ed with that of European origin. In all this the same intelligent sympathy guides the observer, both in what is said (pp. 135-136) of the superior taste and delicacy of the Japanese interior, and in the close examination of pictorial art in the Far East in the chapter devoted to "A Color Print of Yeizan."

The book on 'Arts and Crafts of Old Japan' is confessedly a study of the fine arts of Japan, for although the term "arts and crafts" is generally taken as meaning decorative arts only, and those minor ones, yet it is properly used by Mr. Dick to include painting of landscape, of human character and of incident; and bronze statuary, even of colossal scale. The book has about thirty half-tone plates, each one representing either a single large work of art or a number of smaller objects. Three or four landscape paintings are reproduced from the originals in the British Museum or in private hands, and, in like manner, ancient paintings of legend or of animal character are given. together with a few figure studies in wood-cuts, in black-and-white work, in India ink, or in painting. Three plates are devoted to that wonderful varnish painting which we call lacquer-work (though, or course, there is no *lac* anywhere about it), and these pieces are well chosen, for it was necessary to show a number of designs, and therefore we have in two plates eight *inro*, or portable medicine or perfume-cases, and another plate with one larger piece—the top of a writing-case—which is probably a foot long. Metal work and keramics each have three pictures, and of these it may be said that there is perhaps not such a perfect choice made, as some of the pieces seem to be modern in spirit; but the three illustrations to the ehapter on sculpture and carving are admirably chosen.

As for the text, we are impressed with the sincerely sympathetic feeling of the critical examination. The book passes for a small and inexpensive guide to Japanese decorative art, but the descriptions and comments are full of a very delicate perception. The book seems also the best familiar study we have seen of the visible, tangible work of art whieh we get from Japan, as distinguished from the subtle influences which lie back of it.

Les Deux Frances et leurs Origines Historiques. Par Paul Seippel. Lausanne: Payot & Cie; Paris: Félix Alcan. 1905.

That this work has attracted immediate attention and stirred up lively discussion in central Europe, is in no wise surprising. Its author, a professor in the Federal Polytechnic School at Zurich, aims at establishing a comprehensive psychological thesis as preliminary to the political, and still profounder moral, lesson which he, as a Swiss of the broadest liberal school, would suggest to his French neighbors—his kin in race and speech if not in faith. Dealing with a vast historical generalization (to which ample reference will presently be made), the contention passes with easy strides to a possible application of wholesome and revivifying principles, all but lost sight of amid the rending passions over the struggle for power that has seemed within recent memory not merely to forebode a sundering of tbe integrity of tbe republic, but even to threaten national existence itself. The utterance of such deliverances in a tone of philosophical manliness, rising at times to the tbrill of polemical ardor, is indeed a triumphant witness to the heritage of political discipline.

By "Les Deux Frances" M. Seippel means the two forces now at death-grips over the settlement of paramountcy in tbe State in matters ecclesiastical, both of equal intolerance and resolute in defending to the deatb the right of absolute power and final appeal. The intensity of this contest (which it is all but impossible for the average American to appreciate) is, according to the author, the unmistakable sign of the enduring *mentalité romaine*, the historical origin and implanting of which it is the chief object of this book to set forth, while pointing out at the same time that the initial impress, never obliterated, has ever been the great determinant in the moral and religious movements of *orthodox* France, under every régime. This spirit of absolutism M. Seippel conveys in a singularly bold figure:

"Le virus romain, issu de la décomposition du Bas-Empire, a été inoculé à un organisme jeune et plein de santé; son influence pernicieuse ne s'est fait sentir que graduellement et par des accidents d'une gravité croissante, à mesure que diminuait la force de résistance des tissus cellulaires. Les symptômes très variables de la maladie sont apparus avec une évidence particulière au moment des grandes crises, en particulier aux époques de la Réforme et de la Révolution. Et ce n'est pas seulement la vie politique de la nation qui en a été atteinte, c'est surtout la vie morale et religieuse. De l'ordre temporel, l'esprit césarien s'est communiqué à l'ordre spirituel" (Intr. xxix).

For tbis sweeping statement the author looks for verification in writers typical of successive periods, in each of whom he finds unswerving dogmatic fidelity to this or that universal creed—Calvin, Bossuet, Voltaire, Rousseau, Robespierre, Sieyès, Joseph de Maistre, and so on down to Comte and Brunetière. The list is a formidable one; every member in turn seeks to impose his ultimatum on the nation, even tbe professed liberals maintaining tbe "despotism of liberty" (p. 122): "Il y a toujours en France quelques docteurs de cette école-là" (p. 164). M. Seippel might feel surprised at finding himself here in unison with Paul de Kock, who in a sketch (1844) declared the motto of the boiling reformer to be "Je veux que le monde ait la liberté de faire tout ce que *je voudrai*." When temporary success attends either party, there promptly ensues the endeavor to establish a "delegation of conscience," involving submission to an allegiance strangely akin to the fealty exacted by our own labor unions but recently discussed in these columns; for through the manifold catechisms of what M. Seippel sarcastically calls "L'Église de la Libre Pensée," any reader may detect that its votaries are properly described as merely *inverted clericals*. What the author declares concerning the espionage on the private religious practice of officials (p. 273) has been attested to the present reviewer by immediate sufferers in ample number, who explained tbe difficulty (in certain communities) for an officer or a scboolmaster to countenance the piety of his own family while seeking to remain *bien vu*. And M. Seippel distributes his strictures impartially.

In the same spirit. he discusses (ch. xxi.) a number of so-called conversions—more properly, defections—to which the literary reputation of the penitents has given unwonted éclat. The resultant professions of faith, he holds, have naught in common with tbat of the Port-Royal recluses, any more than their noisy conversions can be likened unto that of Pascal: "C'est une religion d'utilité sociale, faite pour contenir les uns et pour rassurer les autres: la religion de la prudence, si ce n'est la religion de la peur" (p. 332). Throughout the recent struggle, M. Seippel professes to see no religious element whatever, while in the great crisis of the Reformation, religion, if not the sole, was the chief contention. On both sides to-day, he says, not a thought is given to it; the arguments adduced are exclusively political, to the obscuring of the one essential fact that, if true religion be still alive, politics will be powerless to eradicate it; while, supposing it to be already more than half extinct, its revival may safely be expected from persecution.

To discuss seriatim the various points raised in a carefully documented work of four hundred pages is well-nigh out of the question in a review. The impression tbat remains with the reader from M Seippel's work is that of somewhat overcharged pessimism—natural enough, perhaps, in an academically liberal Swiss, who seems to take his conclusions from books rather than from first-hand observations of the actual conditions of French social life, so little interfered with, *for the temperate and judicious*, by the inclemency of personal oppression. There may be lack of earnestness over weighty questions; still more, lack of fervor; but the generous confidence in the future which Frévost-Paradol expressed in 1869 in 'La France Nouvelle,' prevents any one closely familiar with the fundamentally serious character of the nation from apprehending a permanent check to liberal ideas from "cette résignation des gens éclairés et le découragement d'un grand nombre de bons citoyens."

On Ten Plays of Shakespeare. By Stopford A. Brooke. Henry Holt & Co. 1905.

Much criticism would become unnecessary if publishers would agree on some convenient way of indicating the precise public for which a book is intended. Sometimes the title gives a clue, sometimes the repute of the author; or in the preface an explicit statement of aim may be made. But frequently, as in the present instance, all these means fail us. The title, 'On Ten Plays of Sbakespeare,' might attract a schoolgirl or a select audience of scholars. Mr. Brooke has written works varying so widely in point of appeal as to afford no definite presumption. And there is no preface. Accordingly, it remains for the reviewer to attempt so to describe the present volume as to define the public wbo may find satisfaction and profit in it.

Tbe essays, then, take the form of a running comment on the plot, charaeters, and poetry of five of Shakspere's best-known comedies, three tragedies, and two histories. The author has no theory of the drama, no doctrine of Shakspere's development or secret of his personality to exploit. The ten essays are ten independent studies,

and might be printed or read in any order. There is no pretence of adding to the sum of our knowledge of the facts about these plays; nor, indeed, does the author show a profound knowledge of recent scholarship on the subject. It is clear, then, that the book is not aimed at the special student. Neither will the general reader who knows his Shakspere, but is careless of monographs and *Jahrbücher*, find much satisfaction here. So much of the space is occupied by what such a reader will feel to be needless repetition of the familiar that, in spite of the author's fluency and ease of style, it will seem tedious. A happy phrase, a fresh point of view, a piece of sympathetic insight—these are indeed to be found not infrequently. But one who is familiar with the plays will usually prefer Shakspere's telling of the story, and will wish Mr. Brooke had taken more for granted, and had either put in more plums or had made his pudding smaller.

There remains the audience of beginners. No one who has had opportunity to test how far astray the young student may wander, not merely in the interpretation of character, but even in the understanding of what happens in a play, will deny the usefulness of a book which is not afraid of the obvious in such discussions as these. Mr. Brooke, at least, says the first things first, even if he seldom says the last word on anything. And to this third class of readers the facile eloquence of the style will give pleasure, without the irritation which the more seasoned student feels under the touch of condescension from which the reverend critic is seldom entirely free. It is significant that the three great tragedies of "Hamlet," "Lear," and "Othello" are not among the plays discussed. Yet the essay on "Macbeth" is perhaps the most satisfactory and substantial in the volume. Here, as elsewhere, the criticism of character is more penetrating than that of construction; and what is said of Macbeth himself is as suggestive as sound. Mr. Brooke emphasizes properly the predominance of imagination, and draws a valuable distinction when he points out that Macbeth's early compunctions were due less to conscience than to the sense of honor. He sums him up thus:

"On such a temperament, naturally brave, supernaturally fearful; weak in resolve, strong in imagination; a rude soldier with a poet's heart; honorable, but not having any moral foundation for his honor, without the conscience which is honor's guard; his honor only the custom of his class—on such a temperament falls the heavy temptation of ambition."

With the fundamental problem of Shaksperian tragedy, the attitude towards human life implied in the terrible catastrophes, Mr. Brooke attempts to grapple only in the essay on "Romeo and Juliet"; but here he suffers from comparison with the recent great work of Professor Bradley. His thought has neither the precision nor the depth of that masterly treatment; and the fact that it is easier to read, only confirms our conclusion that the present volume is primarily *virginibus puerisque*.

Renascence Portraits. By Paul Van Dyke, D.D. Charles Scribner's Sons. 1905.

Under the above title, Professor Van Dyke gives in one volume studies of three men nearly contemporary in their activities, and representing different countries as well as different aspects of the Renaissance period. Thomas Cromwell in England, Pietro Aretino in Italy, and the Emperor Maximilian I. in Germany are certainly very striking types of a period fertile in individualities. Dr. Van Dyke's purpose in bringing together in this expanded form the substance of several articles contributed to popular magazines is to interest the general reader in the vivid contrasts of human life presented by each of the subjects he has treated. The transitional character of the age is reflected in the singular personal problem of each person here portrayed. In Cromwell we have a statesman struggling to carry a state through the tortuous ways of a breach with the old religious order and the establishment of a new one on a national basis; in Maximilian, a ruler whose fate it was to find himself the last representative of a theory of universal sovereignty and of the romantic age in a world intensely devoted to the practical problems of national development. In Pietro Aretino we see the literary artist, victim of an æsthetic standard divorced from moral content, compelled to utterance by virtue of his instinctive artistic quality, but without a literary material adequate to his creative powers.

Each of these men was a failure in his line. Cromwell, driven to time-serving, perished with his work undone. Maximilian, swept along for a while by generous ideals of national development, found himself diverted from these, and swamped in the mad race for expansion in Italy. Aretino, admired, feared, and execrated in his day, has left a foul name as his only permanent heritage. It is a grateful subject, and Dr. Van Dyke has done a service in bringing it before English readers. He has read widely and well in the period. His style is pleasant if without distinction. Yet the hook as a whole is not convincing. It betrays too clearly its publicistic origin. The general reader, not very familiar with the subject, would hardly feel the elements of unity we have suggested. Even viewed as separate portraits, these studies leave an indistinct impression. The essence of a literary portrait as of a painted one is that it separates its subject from all confusing accessories, and stamps its personality vividly on the mind of the observer. Only in the case of Aretino does Dr. Van Dyke answer to this demand. In the other essays we are let into the workshop a little too intimately. The author has not known how to resist the temptation to wander into much detail that does not bear directly on the impression he wishes to create, and his picture is consequently blurred and inadequate.

An appendix of forty pages discusses the value of Cardinal Pole's 'Apologia ad Carolum Quintum' as a basis for judging the character of Cromwell, and touches incidentally the mooted question whether a certain book which Cromwell offered to lend Pole was Machiavelli's 'Principe.' Dr. Van Dyke offers some plausible reasons for believing that it was not the 'Principle,' but the 'Cortegiano' of Castiglione.

BOOKS OF THE WEEK.

Adams, Samuel, The Writings of. Edited by Harry Alonzo Cushing. Vol. II. Putnams. $5.
Andreas and the Fates of the Apostles. Edited by George P. Knapp. Boston: Ginn & Co.
Beha-Ullah. Les Préceptes du Béhaïsme. Paris: Ernest Leroux.

are the leading booksellers in the United States along certain lines. They issue a Catalog of Rare Volumes monthly, and this, together with their List of Publications devoted to American History, will be SENT FREE to any one making the request.

THE BEST ANIMAL STORY
RED FOX: RED FOX:
By CHARLES G. D. ROBERTS
Author of "The Heart of the Ancient Wood," "The Kindred of the Wild," etc.

The Nation.

NEW YORK, THURSDAY, MARCH 1, 1906.

The Week.

A sense of humor is necessary to make public life "tolerable," argued Sir Wilfrid Lawson, the other day, when nominating the Speaker of the House; and it needed a very strong sense of humor to enable the President to maintain his equipoise when he discovered that Senator Tillman had been put in official charge of his pet railway legislation. The step was, to be sure, a logical sequence of the reporting out of the Hepburn bill by a combination of all the Democrats with the radical Republicans of the committee. Yet there appears to have been something like malice in it. Senator Aldrich's fine Italian hand was never more visible than in the substitution of Tillman for Dolliver as Mr. Roosevelt's latest "spokesman." Here is the piece of legislation nearest the President's heart confided to the man who has most violently attacked him. He is a man, furthermore, who has a reputation as a leveller and almost a revolutionary in his political principles. To his tender mercies is confided the bill which Mr. Roosevelt has urged as a means of forestalling the extremists! Yet in such ways do inner and deep political affinities have a way of asserting themselves, in rude disregard of personal wishes or official dignity.

It is clear to us that the only real contest left over the railway-rate bill relates to the right of judicial review of the decisions of the Interstate Commerce Commission. On this point, Senator Knox's section, in his personal bill introduced on Thursday, seems admirably drawn. It would doubtless save the law from being declared unconstitutional—a danger to which the unamended Hepburn bill is thought by good lawyers to be manifestly exposed—and promises to be equitable in operation. The provision that the railroads are to give a bond, during the suspension and litigation of any order reducing freight rates, to pay back overcharges to shippers in case the courts decide against them, seems to meet all the ends of justice. Of course, in actual practice, the railroads would have occasion to fight very few orders in the courts; but they ought not to be deprived of the right to do so, under proper safeguards. It is now evident that the final form of the bill will preserve them this right; and if disappointed radicals like Senator Dolliver assert that this will reduce the whole measure to a nullity, they only thereby disclose the fact that they were contemplating a plan impossible under the Constitution.

If the Senate was practically unanimous for the Pure Food bill, as the vote showed on February 21, the only wonder is that it should have taken fifteen years of agitation to pass it. As a matter of fact, the defeat of the bill, once it was brought to a vote, was never among the possibilities. The four Southern Democrats who cast negative votes did so on grounds that had really nothing to do with the actual need for legislation on the subject, or the merits of the particular measure. The history of the Pure Food bill has been used as an example of the way in which special interests can secure the indefinite postponement of good legislation. It might also be taken to show the possibilities of misrepresenting the actual effect of such a measure. Argument after argument has been put forth on the assumption that the Heyburn-Hepburn bill (1) interfered with the right of the States to regulate the standards of food products within their own borders, (2) gave the Secretary of Agriculture power arbitrarily and without a hearing to publicly declare any food product to be injurious, and (3) required the publication of trade secrets in the shape of formulas. Really, it does none of those things. With those misconceptions cleared away, as was promptly done by the able speeches of Senators Heyburn and McCumber and others favoring the bill, there was literally nothing to do but support it.

Meanwhile, those manufacturers whose business would come under the scope of the bill and who yet accepted it as inevitable, have adopted a much franker and more candid attitude toward the public. Since their goods must hereafter be sold on their merits, if at all, they are beginning to argue that they have merits. There has been altogether too much talk about "poisoning" in connection with the pure-food agitation. The real evil has been plain swindling, and the majority of adulterated products are perhaps as innocuous as the historic wooden nutmeg. There are many products, now systematically sold as something they are not, for which there should be a perfectly legitimate demand when they are offered for just what they are and at reasonable prices. There is undoubtedly not a little unreasonable prejudice combined with the very just resentment of the public against the frauds that have been practised in past years. Instead of yielding to the groundless caprice of the consumer, the passage of the Pure Food bill ought to be the first step toward removing it.

"To give America time to think," was the German Government's explanation in the Reichstag of its willingness to make a provisional tariff arrangement with the United States. There is, of course, a veiled threat in the words, though they only follow, after all, what Secretary Root has said of his hope that the Senate may prove less obdurate next winter. But the idea that what we need is time to "think" about the tariff! Thought is the last thing lacking. Take Massachusetts, for example, a very factory of Republican thought. It is about all one way there—except for Lodge. The Democrats to a man want the tariff revised, and the Republican Governor has written to the President urging that something be done at once to preserve the party from disaster. And that is very much the case the country over. As a matter of mere intellectual conviction, the agreement is well-nigh absolute that the present tariff is a burden grievous to be borne, yet bound upon the shoulders of Americans by selfish interests intrenched in political power. But protection simply grins and asks what we are going to do about it. It will never be made to budge by pure thought, we may depend upon it. Some sort of *vis a tergo* will have to be applied—and it may take the form of a Democratic majority in the next House.

There are thirty-seven Representatives whose districts include ports of entry where the expenses exceed the receipts. A fortnight ago, when Chairman Payne of the Ways and Means Committee tried to bring up a bill authorizing the President to rearrange the customs machinery on business lines—not necessarily abolishing all these ports, but consolidating the ones with small reason for existence—just three of those thirty-seven voted favorably. They were William Alden Smith of Michigan, Republican; John Austin Moon of Tennessee, and John Sharp Williams of Mississippi, Democrats; and their names deserved to be registered on the deplorably short roll of legislators willing to apply principles of wider application where any local interest is involved. There voted against considering the bill 16 Republicans and 11 Democrats who had unprofitable custom houses in their districts, while 6 Republicans and 1 Democrat were among those "not voting." Among the "nays" were to be found two members, Allen of Maine and Gardner of New Jersey, who had two of the "fake ports" at home, and six members, Burleigh of Maine, Greene of Mas-

sachusetts, Hermann of Oregon, Lovering of Massachusetts, Patterson of North Carolina, and Thomas of North Carolina, with two each. It was not the vote of these quasi port-wardens that defeated Mr. Payne's manifestly proper bill, to be sure, for, leaving them out of account, the vote would have stood 136 to 84; but we get as nice a glimpse of the almost mathematical completeness of log-rolling methods as we have had in many sessions.

The history of pension order No. 78 will come to an end when Congress has enacted the substance of that famous regulation into law. It has not increased our appropriations by anything like the estimates made by hostile critics, nor even those which Commissioner Ware made the basis for asking a special appropriation. But it did swell by a very considerable sum the pension-roll. Of course, not all of the $3,668,-064 added to the total of pensions, nor all of the 78,800 claims allowed since the order was promulgated, are traceable to its workings. Still, the figures show that the average number of applications granted in a month has increased by nearly 10 per cent. since the order went into effect. A minimum estimate of the cost of the order might be made by reckoning from this additional number alone. There has been an average of 321 more applications granted monthly since April, 1904, than in the fiscal year before that. This would make, up to February 1, some 7,900. Supposing that these averaged $6 per month—the minimum pension for age alone—this would increase the roll by nearly $560,000. It is clear that veterans have not taken advantage to the full of the privilege extended to them. Also, it was not to be expected that the full effects would be manifest at once. It took three years for pension appropriations to reach their maximum after the passage of the sweeping act of 1890.

Francis Hendricks, State Superintendent of Insurance, is unsparingly pilloried in the Armstrong report. He appears, exactly as the evidence taken at the hearing shows him, either grossly incompetent or venal. Gov. Higgins has talked about the "fidelity and integrity" of his personal friend Hendricks; but Gov. Higgins, Superintendent Hendricks, and everybody else knows that fidelity is a virtue in which the head of the Insurance Department is conspicuously deficient. For the last five or six months Higgins has had ample evidence that—to quote the report—"most of the evils disclosed would have been impossible had the Department done its duty." Had the Governor not placed protection of his political crony above protection of the policyholders, he would have driven Hendricks from office early last autumn. Gov. Higgins has for many reasons richly merited public contempt, but nothing that he has done or left undone shows so clearly his feeble conception of duty as his retention of the disgraced Hendricks.

The resignation of Stuyvesant Fish from the directorate of the Mutual Life lays a heavy responsibility upon President Charles A. Peabody and the remaining trustees of the company. Mr. Peabody's explanations have neither obscured nor diverted attention from the fact that Mr. Fish was refused information which is absolutely essential to thorough investigation of the company's affairs. His committee was instructed by the trustees to go to the bottom; but when the probe struck the trustees themselves and perhaps certain others high in the management, his hand was stayed. So far as President Peabody and the Mutual Life are concerned, it is an unfortunate coincidence that Mr. Fish's withdrawal follows close on the publication of the Armstrong report. That document declares explicitly:

> "It does not appear that the board of trustees exercised any effective checks upon the management. . . . The committee on agencies did not supervise the most important of the agency contracts. The committee on expenditures permitted large disbursements without proper vouchers, and the auditing committee failed properly to audit the company's accounts."

We know that certain trustees were interested with the company in syndicate participations. The slackness of the management has thrown a majority of the board under the gravest suspicion. The singular thing is, that the members themselves, regardless of President Peabody and others who may have damaging facts to conceal, do not insist upon such a policy of drastic housecleaning and complete publicity as shall allay the widespread distruct of the Mutual. Under the present policy the management cannot hope for the support of sane and honest men. The revolution has begun, and it will not end, we venture to predict, until the Mutual is in the hands of men who will conduct it for the benefit of the policyholders.

With a single dissenting voice, the members of the National Academy of Design voted last week for union with the Society of American Artists. The plan of merger remains to be presented to a full meeting of the Society, but one need hardly expect opposition from that quarter. It is probable that the plan of federation which a joint committee has had under deliberation for more than a year, may yet be amended. There will remain also difficulties of a technical and legal sort, but on the main issue the late vote assures the union. It will be heartily welcomed by all lovers of art, for the differences between the older and younger organization had pretty well disappeared, and anything like a useful rivalry had ceased to exist. Being essentially one in purpose, further disunion would have been poor economy, while the partnership promises a renewal in authority and in strength. For the first time in more than a generation, we shall have an artists' society that fairly represents all schools and all quarters of the country. Such a body may confidently appeal to the wealth of this city for the larger exhibition quarters that are so much needed if the rejuvenated Academy is to have a public effect commensurate with its professional importance. Great credit is due the joint committee for elaborating out of a difficult situation a practicable scheme of union. Especial praise should fall to the old Academy for an act at once so generous and so expedient. For the sake of art in America it has made no mean contribution of snug endowments, not to mention the even greater sacrifice of the cherished academic right of preëmption of wall space ever too scanty.

The investigation into the public offices of Cincinnati and Hamilton County has begun with vigor. At the very first session of the legislative committee the County Treasurer, R. J. Hynicka, confessed that he had received in "gratuities" between $15,000 and $20,000 from banks which received from him a deposit of public moneys. He carefully explained that he had never asked for anything; the kind-hearted bankers merely realized how inadequate his official salary was and wanted to help him out. In other words, we have again been shown how political corruption finds its strongest supporters in the world of high finance, among the business men of high estate who fill the pews of the churches and so plaintively echo all regrets at the misgovernment of our cities. Behind the boss is ever the conscienceless banker or railroad president of life-insurance manager always so ready to "give up" to any politician who may strike him for this or that purpose. This Cincinnati investigation should make Ohio doubly glad over the Democratic victory last fall—the Republican members of the committee declining to serve. It has already borne out all that Secretary Taft said about the alliance between the Ohio boss and the corporations.

A Southern reader has called our attention to some refreshingly vigorous resolutions passed by the Etowah County Bar Association at Gadsden, Ala., in reference to the lynching of a negro named Richardson at that place on Sunday, February 11. A mob of some 25 or 30 persons broke into the county jail, took out the negro and put him to death because he was accused of the murder of a white woman. The grand jury had

investigated the case, and, failing to find any evidence connecting Richardson with the crime, did not indict him. The mob knew better, and took the opportunity offered by his being held to await the possible discovery of additional evidence. The Bar Association acted within forty-eight hours, and in this wise:

"Whereas, the lynching of a person by a mob is nothing less than murder in its vilest form, and is destructive to all law and order as well as of the great and saving teachings and principles of Christianity, now, therefore, be it resolved that the lynching of Bunk Richardson is greatly deplored and should be condemned by all law-abiding citizens of the county; that the murder of this man be and hereby is condemned in unmeasured terms; that all law-abiding citizens of the county are urged to coöperate with the Bar Association in quenching at once this unlawful and awful spirit of taking the life of a human being without a trial under the forms of law."

The Bar Association also called upon the ministers to instill a better spirit into the youth of the community. Our correspondent remarks with pride, and with truth, that no such ringing resolutions were passed by any association of lawyers when there was a lynching in Belleville, Ill., and that there was no similar public protest in Wilmington, Del., when that town was disgraced by a murderous mob.

The few Unionist members who "viewed with alarm" the Irish declarations in the King's speech were apparently very much alone in their opinion, and the first party division in the new House of Commons brought the handsome majority of 318 for the Government. This barren protest was, however, the occasion of an interesting statement from the Irish Secretary, Mr. James Bryce. He made it clear, while declining to go into details, that the Government would hold itself free to work towards Irish self-government. A rather striking and unexpected feature of his address was the statement that he regarded the mandate of the recent elections as plenary in all Irish matters. This is somewhat at variance with the tone of Liberal arguments during the campaigning; but, obviously, the Unionists are the last people to complain of such an interpretation of the elections. They opposed the Liberals precisely on the ground of the old Home Rule contention, and if the Liberals should actually propose legislation more radical than has been expected, they would merely be taking the Unionists at their word. Mr. Bryce's speech is important, then, because it shows that the Government will use a free hand in dealing with the Irish question. Mr. Redmond's followers are, probably, at best resigned to the prospect of measures which, being planned for their relief, they cannot well oppose, though in the shaping of which they are in no position to claim a leading part.

Naturally, John Morley has reversed the action of his predecessor in placing the military power above the civil in India. The biographer and pupil of Gladstone could not be expected to do otherwise, for he has himself traced the change of view which led the great Premier finally to realize, as he did not at first, the supreme importance of preserving the independence of the civil authority as opposed to the ecclesiastical or the military. When the Balfour Government finally crumbled, a shrewd English observer declared that, whatever else the Liberals might do, they would not dare to stop the importation of coolies into South Africa or to overrule Lord Kitchener, the popular military idol. The Liberals have shown that they possessed the necessary courage to do both these things, in addition to reaffirming Gladstone's Home Rule position, and their boldness must win them many friends, if only by the contrast between their courage and the timidity of Balfour. As for Lord Kitchener, he seems to have bowed to the inevitable with all possible grace; at least he has not asked for his recall, as did Lord Curzon when he was overruled. The closing of the incident leaves Curzon in a stronger position than ever, and will strengthen the belief held in many quarters that, if he has health and strength, a great future is before him.

It is seldom that an English city is hauled up by the courts for municipal trading *ultra vires*. Some years ago the London County Council was forbidden to run omnibuses in competition with private owners. It was held that this was an application of taxes and public funds to unauthorized purposes. A similar decision has recently been made, limiting the powers of the "Manchester Corporation Tramways Parcels Express." That corporation had undertaken to do a general express business, not only within Manchester, but with all parts of the United Kingdom. It quoted rates to Liverpool, held itself out as an agent for all railway companies, and also accepted "traffic for abroad." This business has now been held by Mr. Justice Farwell to exceed the powers of the Corporation. It is not authorized, the court decided, to operate beyond the lines of its own tramways. All this, of course, leaves municipal ownership and municipal operation undisturbed in Manchester; but the suit itself is a sign that, even in England, there is a feeling that the business has been overdone. Ratepayers there are suspecting, too, that the impaired borrowing powers of their cities are not wholly unrelated to municipal ownership.

A bill for old-age pensions has passed the French Chamber of Deputies. This is the first serious step towards fulfilling the promise made by Waldeck-Rousseau, seven years ago, when he organized the famous "Cabinet of Republican defence." The pledge was the price of support from the Socialists of the Chamber; it was probably given in the hope that the debt need never be liquidated. The measure was postponed from time to time, on the ground that the budget would not stand the strain; it has now taken a form by which the Treasury at least seems to be relieved of the greater part of the burden. The laborer and the employer contribute annually a percentage of the wage, and the Government makes up any deficiency in a pension which is to be sixty francs a month, falling due at the age of sixty-five. As a financial proposal, this is evidently open to grave objections. Though nominally outside the Treasury, the contributions of workman and employer are none the less a tax. The engagement of the Treasury is wholly incalculable, because it is very difficult to estimate either the number of pensioners or the extra-budgetary contributions. In fact, the discussion of the bill has been conducted with a fine disregard for mere figures. The other day the provisional pension granted pending the establishment of the permanent fund was raised from 50 to 120 francs, involving an increase on this score from 48,000,000 to at least 115,000,000 francs.

Of course, the establishment of a new department and the entrance of the Government into the business of insurance do not appear to be evils in centralized France. Graver objections are felt in the clashing of the new project with the workingmen's insurance societies and the retiring pensions voluntarily offered by many employers of labor. Some attempt has been made to consider these existing institutions in drafting the bill, but it is clear that the adjustment is a delicate one. Retiring pensions are very common in the better class of French business and manufacturing houses. Obviously, no business concern is going to pay the Government levy without reducing its own insurance reserve. In some cases there will be the temptation to abolish private funds, and simply pay the pension tax as the cheaper. An even weightier objection to the bill is that it burdens the Government with charges readily incurred, but hardly revocable. What popular Government has ever dared shorten the supply of bread and circuses, once granted? All these drawbacks will be carefully considered in the French Senate, for French statesmanship is not above the expedient of hurriedly passing a popular measure through the lower house, in order that the upper house may quietly let it die, and incidentally shoulder any resulting post-mortem unpopularity.

THE INSURANCE REPORT.

In the notable review of its work by the Armstrong insurance committee presented to the Legislature on Thursday, public interest will be divided between the very comprehensive summary of the facts elicited and the committee's proposals for reform. The summary of the evidence—considering the number and complexity of the points brought out in the testimony—is an achievement of extraordinary skill; we commend to every one interested in the insurance question the perusal of every word of it. People who have become somewhat confused as to exactly what was established by the committee's four months of exhaustive inquiry will rise from that reading, not only with interest in the whole situation keenly stimulated, but with a sense of ability to frame intelligent judgment on the propositions of reform.

Throughout the investigation, public attention has converged on five main questions. The problem whether some check could be applied to the portentous expansion of capital resources, under control of a single group of men, possibly stood first. The manner in which insurance surpluses should hereafter be invested was a consideration next in importance; it involved the questions of participation in Wall Street promoting schemes, ownership of other banking institutions, and "syndicate operations" by trustees as individuals, in common with their company. The problems of how control by policyholders might in a mutual company be made effective, of how the "deferred dividend" policy should be dealt with, and of how to abate the evils of life companies' meddling in politics, followed after. The committee's report embodies a thorough discussion of these important matters. The report is also, and most fortunately, as bold and explicit in its recommendations as it is comprehensive in its scope. Perhaps the most unhappy outcome of the insurance episode would have been a feeble or faltering body of recommendations by the committee, which would have left the Legislature to wrangle over a host of crude and conflicting makeshifts proposed from outside quarters. Nor, in our judgment, does the committee err on the side of rash or radical suggestions. Much the greater part of what it recommends will command at once the united support of intelligent public opinion.

The committee properly refers to the stupendous growth of the three largest companies as an evil in itself. In the race for financial size and power, extravagance in management has been increasingly promoted. Wasteful methods, employed to get new business at any cost, have imposed a heavy burden on the legitimate clients of the companies. This very magnitude of business and resources, the committee shows, "makes the question of responsible control and conservative management one of extreme difficulty." The committee recommends that the new business to be annually done by an insurance company be hereafter limited to $150,000,000. This figure is obtained on the basis of reports showing that, in the three great companies, termination of policies in 1904, through death, maturity, lapse, or other causes, ranged from $129,125,280 to $162,326,114. This absolute limitation the committee would apply to companies with more than $1,000,000,000 insurance now in force; with smaller companies, they advise restriction of a year's new business to a fixed percentage of outstanding insurance. We imagine that this part of the report will incur more general criticism than the others. Hitherto plans for restriction of indefinite growth have most commonly evoked the expedient of forbidding, not acceptance of further business after a given limit, but solicitation of business under such conditions. With the limit reached, a company may not seek to place new insurance, but may accept such applications as come spontaneously before it. We are not prepared to say that the committee's plan is inadvisable, but some objections to it certainly occur to us, from the standpoint of the policyholder himself.

The committee's recommendations regarding investment of insurance funds will probably be described as radical. But truly radical treatment of the question was required. If anything was plainly proved by last year's investigation to be a necessary reform, it was that life companies should be prohibited from holding shares in other enterprises. Ownership of subsidiary institutions has been denounced by insurance committees of inquiry during a quarter of a century; the practice, in the Equitable's case, was unqualifiedly censured by the Frick report, and nowhere did the Armstrong investigation prove more objectionable and demoralizing practices to exist. There is, in our judgment, no remedy for the evil other than complete abolition of the practice. The committee's proposal that five years be allowed the companies to dispose of their holdings of these and other stocks, ensures quite sufficiently against disturbance of the markets. The committee very wisely declares that application of the "savings-bank restrictions" to insurance investments would not be advisable; it proposes no restriction whatever on investment in bonds, except the exclusion of the so-called "collateral trust bond"— a recent device whose entire security is stock bought up through the proceeds of the bond. The report's very positive recommendations that all "syndicate participations" by insurance companies be prohibited, and that no officer or director shall be pecuniarily interested in any purchase, sale, or loan of his company, will be approved by every intelligent man who followed last year's testimony.

The practically important part of the committee's proposals regarding control of insurance corporations lies in its plan to authorize independent nominations at the hands of any group of one hundred policyholders, to require the companies to include all such candidates on ballots officially circulated by them, and to require that lists of policyholders be made accessible. It is possible that this plan will be further defined in subsequent discussion; what will at once attract attention is the committee's recommendation that, in order to give full scope to the new plan of voting, all of this year's annual meetings be postponed to November 15, within which time independent campaigns would be practicable. The bearing of this proposition on the present Mutual Life situation is too obvious to need statement.

With the committee's conclusion that issue of the so-called "deferred dividend policies" should hereafter be absolutely forbidden, we are in entire agreement. In common with all disinterested expert opinion with which we have come in contact, we believe these policies, and the virtual non-accountability of a company which writes them, to be very largely the root of past abuses. The committee's proposal that political contributions by the companies be made a penal offence, will equally, we think, meet with the cordial endorsement of right-thinking men. So, too, of the plan to create a body of authorized and duly licensed "legislative counsel," through whose employment, officially declared and described, the lobbyist of the Andrew C. Fields and Andrew Hamilton type will, in insurance legislation, be made a thing of the past.

THE CONFUSION AT WASHINGTON.

Since Hamlet and Laertes changed rapiers, there has been no more dramatic shift than that by which the bill of the Republican President has been put in charge of the Democratic minority in the Senate. The result is to throw parties into confusion, to perplex counsels, and to set political leaders at cross purposes. As if the stories of Aldrich's break with Mr. Roosevelt were not tragic enough, the painful news comes that Lodge's friendly magnanimity in bearing with the President's vagaries has at last been stretched to the breaking-point. The Massachusetts Senator lets it be known that he cannot approve Mr. Roosevelt in the embrace of Senator Tillman. His real grievance, however, goes deeper. The President is reported to have said in his jaunty way that he could go right into Massachusetts and beat Lodge. This, of course, is simply horrible. The supposition that anybody could rival Senator Lodge in the respect and affection of the people of Mas-

sachusetts, must be, as the Greek Grammar says, a "supposition contrary to fact."

Into such sacred personal sorrows we cannot enter. But the party wrangling threatens to make the public interest suffer. There is an unhappy competition for the "credit" of the railway bill, without due inquiry whether it is going to be creditable to anybody to pass it in its present form. The President is said to take the position that the country will recognize the bill as his, in any event, and that he need not care a button if it is passed under Democratic auspices. Meanwhile an acute discussion has sprung up over the question whether a "nationalized" Democratic club ought to speak of Mr. Roosevelt as a "born Democrat." If he is, it must be said that, like the man in the Scriptures who was created upright, he has since "sought out many inventions." But the real Democrats at Washington are pluming themselves, and with reason, on their skilful management. Their opponents were reckoning complacently on a split in the Democratic minority, when, lo! it was the Republicans who suddenly appeared torn into warring factions. The President is naturally blamed for this; but he might well retort that those who are responsible for party divisions are the ones who think that man was made for party, not party for man. Yet it is clear that the tactical advantage rests with the Democrats, who are plainly profiting by the new and skilful leadership of Senator Bailey. They now have a good opportunity to show what they can do in the way of constructive legislation.

Much will depend upon Senator Tillman. His erratic course and tempestuous speech have not concealed his real abilities. Entering the Senate as a sort of "wild man," he has remained to gain the respect of its ablest members for his knowledge, industry, and honesty. If he could be kept from the passionate outburst and violent invective which too often disfigure his public addresses, he might easily make for himself a great reputation. Some of his friends are saying that he will rise to the height of his present opportunity, and by wise and restrained handling of the railway bill, now placed in his charge, will show that he has in him the elements of statesmanship. But his skilled antagonists know perfectly his weak points. They understand his temptation to pose as an extreme radical and to rant as such; they know how to goad him to fury; and it would not be surprising, therefore, if the Senate were to see the effort made to pass the Hepburn bill by a joint brandishing of the Big Stick and the Pitchfork.

Beyond all such considerations lies the unfortunate fact that the clamor and controversy about the dubious parts of the Hepburn bill are diverting public attention from its meritorious features. The latter are acknowledged and uncontested, yet they are almost forgotten in the embittered dispute over the conferring of the rate-making power upon the Interstate Commerce Commission. In his speech in the House, Representative Mann of Illinois enumerated no less than ten great improvements proposed in the bill, irrespective of rate-fixing. These include an enlarged definition of "common carrier" and also of "railroad," so as to bring under the latter all terminal facilities as well as storage, icing, ventilation in transit, etc.; aboltion of the "midnight tariff" by requiring thirty days' public notice of a change; provision that charges for refrigeration shall be separately stated; a plan for uniform accounts and for the rigid prevention of secret rebates. Now, these clauses of the bill represent the real demand of the people for railway legislation by Congress. The actual grievances of shippers—merchants and farmers—are here covered. Railway rates *per se* have not been complained of extensively, but the discriminating rate, the collusive and corrupt rebate, the disguised charge, sharp practices in circumventing the Interstate Commerce law. These abuses are struck at in the Hepburn bill as effectively as they can be by any statute, probably, yet, by an unhappy "Presidential non-sequitur," as Congressman McCall described it, these great reforms, practically non-contentious as they are, have been too much tied up with the fate of a clause which has little to do directly with the wrongs that are mentioned above, and which is in itself so ambiguous and so doubtfully Constitutional that it endangers the whole legislation.

Senator Knox has given it as his opinion that the rate-making section of the Hepburn bill is, as drawn, certain to be held by the Supreme Court unconstitutional. As to its actual working, if legal, two impartial students of railway problems have recently expressed grave doubts. President Hadley thinks that the proposal to make the decision of the Commission final in all questions of fact is "illogical and impractical." And Professor Ripley of Harvard, in the last number of the *Quarterly Journal of Economics*, comes to the conclusion, after an exhaustive study of the natural history of railway ratemaking, that the "American railway practice" is one of "essential soundness"; that there is danger in "arbitrary administrative interference"; and that "the main activity of any Governmental commission should be directed towards settlements out of court, with as little exercise of mandatory power as possible."

A MUSEUM PROGRAMME.

After a year of deliberation, the trustees of the Metropolitan Museum have formulated a comprehensive policy which is embodied in their annual report. This document is likely to have a permanent interest. It has a limited and topical interest also because it is, in effect, what our ancestors would have called a counterblast to the ideas of museum management in favor at Boston. The Metropolitan Museum takes the ground that its function is primarily educational, both as regards artists, artisans, and students of the history of art. To æsthetic considerations it will give all the weight compatible with its main object. It will, however, welcome gifts of reproductions where originals are not available; will copy famous interiors as setting for original exhibits of the period, and, finally, will for the future give more persistent and systematic attention to the industrial arts.

Here is matter that in a column's space can merely be touched upon. For the promise of activity in the field of the applied arts, everybody should be grateful. Museums are still too much under the tyranny of eighteenth-century definitions of the "sublime and the beautiful." Any policy that makes us realize that the standards for the so-called fine and for the industrial arts are identical, is a wholesome policy. In any normally creative period, the difference between decorating a spoon-handle and a cathedral is chiefly quantitative. The chief mission of Japanese art to that of the West has been to prove that the principles of design are universal, and that segregation by material or intention is generally misleading. The important thing is quality, whether conveyed by pewter, pigment, or bricks and mortar. One may fairly rejoice that our accumulations are not so excessive but that all the arts may still be exhibited under one roof.

Of course, devotion to the applied arts has its particular pitfalls. The danger is that of confusing ethnological with artistic values, of seeking what is merely old and curious instead of what is really fine. Already the Metropolitan Museum possesses an old telegraphic instrument, not to mention the swords and medals presented to Gen. Grant in his famous trip around the world. Now, in some museum or another these objects might well find a place; that place is emphatically not an art museum. One can successfully gather a collection in the industrial arts only upon condition of maintaining standards quite as rigorous as those applied to painting and sculpture. That practically such standards will be adopted one may assume, while wishing that, for the sake of the record, the report made more specific statements on this head.

The matter of art reproductions is more contestable. No student of the arts can deny their value when carefully made; on the proper method of exhibiting them a wide diversity of opinion ex-

ists. Undoubtedly, the ideal plan is to segregate them in special museums, like the Trocadéro in Paris. To do this in America would leave whole departments of our museums practically empty. On the other hand, to show reproductions side by side with originals is at best a necessary evil. It is an arrangement confusing to the judgment of the layman and fatiguing to the special student. One may except, perhaps, a few examples of actual facsimiles or copies of high grade. Electrotypes of metal objects, casts of the Herculaneum bronzes, Armand-Durand's extraordinary copies of ancient prints, are surely desirable objects for any museum that cannot secure the corresponding originals. On the other hand, many kinds of copies, especially ordinary plaster casts of originals in finer materials, seem so calculated to blunt the sense of quality in the layman that many consider them suitable only for the special student. Be that as it may, any museum that is growing rapidly should be progressively getting rid of reproductions, and if the Metropolitan Museum accumulates copies in profusion, it will be virtually preparing the way for some American Trocadéro of the future. That goal is by no means an unworthy one, but it is a question whether greater simplicity of aim is not preferable for present purposes.

As for reproducing historic interiors after the example of the National Museum at Munich, we are for going slowly. Surely, the advanced student of art history would find no profit whatever in such examples of stage carpentry. His best materials lie in photographic reproductions and the plates of standard archæological volumes. Of course, the man in the street would gratify a certain curiosity, and the craftsman get a hint from such an interior. But, for the artisan, small models are actually more useful. These are relatively inexpensive and often of great merit. Genuine interior decorations the Museum may be glad to transfer to its home; old woodwork and other decorative fragments may at times be very usefully built into the galleries; but to reproduce whole interiors, when such cheap and superior substitutes as the small model, the photograph, and the lantern slide are available, would, many believe, be the very poorest economy, to raise no larger issue. We should welcome the fullest collections of ancient furniture and fittings, anything that brings home poignantly the sense of times more artistic than our own.

With the spirit of the report, taken broadly, we are in thorough sympathy. This statement of the trustees gives the soundest assurances that the future policy of the Museum will be thorough, cautious, and scholarly. The presence of such connoisseurs as Dr. Robinson and Mr. Fry on the staff is a guarantee that art-historical ideals will be pursued in no narrow spirit, but with proper consideration of æsthetic ideals. On another occasion, we expressed admiration for an ideal of museum management more selective than that which is proposed at Central Park East. We believe that the museum of the future will, as a matter of fact, necessarily become rather anthological in its public exhibits than comprehensive. But the time is not ripe for such an advance in New York. In fact, by the form of its buildings and its traditional policy, the Metropolitan Museum is committed to educational and art-historical ideals. Along these lines there are years of work in sight, before the completion of which any general change of policy would be premature. It would be absurd to apply rigidly æsthetic principles in a museum that is still in process of being brought up to the standards of art history. The present report to the trustees deserves study, not as an ideal programme of museum policy, but as a sober and thoughtful statement of the policy that is practically best, considering the past of the Metropolitan Museum and the present conditions of art in New York.

THE NEW FRENCH ACADEMICIAN.

"They order this matter better in France." What the Englishman does without understanding and the German understands without doing, the Frenchman makes the meeting-ground of thought and action, of literature and life. There is for this reason more than passing significance in the election of Maurice Barrès to the Académie Française. His progress from an individualist to a traditionalist, to use the awkward terms, receives a kind of sanction as expressing a national, indeed, European, movement. With Brunetière and Anatole France he shows how literature in France reflects the desperate efforts of the people to escape from the *impasse* to which the individualism of the Revolution had brought them.

By individualism is not meant the right of each person to develop naturally, without the dwarfing and warping of petrified custom, nor yet the inevitable and wholesome law of competition, but that absence of all higher sense of union between man and man which led to a weary and morbid egotism and to complete moral irresponsibility. This was the kind of individualism which the French, as the most logical of nations, developed into a theory of life and too often practised. This was the *culte du moi* of which Barrès, as a young and brilliant writer, made himself the high priest and won many disciples. He was the accepted psychologist of the *Déracinés*. And it is in this sense that his career may be called, as Paul Bourget points out in the *Figaro*, the tragedy of individualism. As he grew in experience he was more and more impressed by the terrible isolation and impotence into which his logic was dragging him—for it cannot be said too often that in France literature and life move together hand in hand. In one of his earlier monologues, named significantly "Affaissement," he exclaims:

> "Je n'ai plus d'énergie, mais à la sensibilité violente d'un enfant je joins une clairvoyance dès longtemps avertie. . . . *Ce n'est pas de conseils, c'est de force et de fécondité spirituelle que j'ai besoin!*"

And he observed with increasing alarm this paradox of French society, that the more deeply the doctrine of individualism (the false individualism, we must always remember) sank into public consciousness, the smaller became the actual number of vigorous individuals. As M. Bourget expresses it: "This age of extreme 'personalism' thus finds itself an age of personalities more and more incompetent, more and more anæmic."

Thereupon M. Barrès began to examine into the matter. He observed that his personal experience was in conformity with the teachings of history. Both showed that the theory of individualism was directly contrary to the growth of a strong individuality. Something was wrong in his definition of individuality. He had looked upon the individual as a *phénomène premier*, as a thing independent and supported by itself, whereas it turns out to be a *phénomène conditionné*. This *ego* which he proposed to cultivate and pamper, did not spring up of itself beyond the limitations of time and space, but was the result of accumulated hereditary influences, and could develop harmoniously only by following these tendencies implanted in it from an unknown past, and by making itself one with the people and the land which had grown up under similar influences. From being an exemplar of the individualists, M. Barrès thus became the leader of the traditionalists. From the *culte du moi* he passed to the *religion du sol natal*, to a childlike acceptance of the thoughts and sentiments transmitted by the earlier generations who had in turn received them from the land itself, with its physical features and its immemorial history. He felt the appeal of those unconscious sources of energy, drank in a new faith in the mysterious virtues of the race, and learned to reverence that august silence of the heart through which the voices of the dead speak and are heard. He was no longer unrooted, but deep-rooted to the earth.

M. Bourget expounds all this with his customary fineness of analysis. He does not, however, point out the relation of this conversion to the recent defections of Brunetière and Anatole France. All three of these men, who stand at the very head of French literature, have sought, each in his own way, a refuge

from the intolerable oppression of that kind of individualism which grew politically out of the Revolution and literarily out of Romanticism. They all saw that some new bond of union must be found to link men together, that the isolation of utter skepticism and self-worship was but a stage of death. Brunetière, in whom the logical generalizing faculties predominated, turned to the rigid dogmas of Catholicism for relief, his conversion to that faith being more a matter of intellect than of religion. He became a reactionary, and his present aim is to associate men by submission to a common and infallible creed. In Anatole France the spirit of skepticism was too strong to permit such a conversion as had already come to his constant foe in literary criticism. On the contrary, he was swept away by the socialistic movement which undertakes to unite men through the levelling process of economic laws. It is significant that the avowed exponent of intellectual indifferentism should thus have fallen a prey to what is probably the most impracticable theory of social union yet promulgated. How M. Barrès looked to traditionalism for relief, we have already shown.

The attitude of these three leaders of thought is no freakish pose on their part. It represents one of the deepest needs of the age, and shows itself with that logical precision and courage of conviction which are an inherent part of the French character.

FURTHER NOTES ON MEXICO.

JOHN HOPKINS UNIVERSITY,
February, 1906.

About the time of the death of Maximillan and the restoration of Mexican independence, a man arose ready for his opportunity—Gabinus Barreda, a Mexican, born in Puebla in 1824, educated in law and medicine in Mexico City, who had been studying under Auguste Comte in Paris. Enthusiastically adopting the Positivist scheme of knowledge, and with it its negative attitude — "positively negative," we should add, as Comtist writers demonstrate fully—towards metaphysics and all the children of the subjective point of view, such as psychology, he was just the man to seize the chance to carry out the Positivist programme in a comprehensive scheme of education. As head of the commission of 1867 he was given a free hand to reorganize the national education, including the curriculum of the Preparatory School. This school had hitherto furnished a typical and intrinsically the most important illustration of the vicissitudes of a private foundation, gradually dying from poverty and maladministration, while occasionally galvanized into life by Government aid. It finally passed over to the national Government, as did so many other institutions whose loss of private autonomy served to swell the tide of nationalization. The Preparatory School became the official embodiment of the policies of national education pursued by the successive ministers. And in Barreda the time was come for the Positivist noveltles to have their "innings."

In the result, these noveltles did have their "innings." Barreda drew up a curriculum based *in extenso* on Comte's classification of the sciences in a hierarchy of logical comprehension: chemistry based on physics, physiology on chemistry, etc., through all the stages of development now so familiar to us. Beneath all this was the Comtean platform also—the recognition only of those disciplines (the Positive Sciences) which grow up by objective observation and experiment. These studies, thus exclusively recognized, were distributed through a five years' curriculum, each subject running a full year; and the only departures from the strictly logical order, as prescribed by the Positivist rubrics, were the overlapping and lack of consecutiveness due to the limitation to five years. Metaphysics and theology were abolished; with them psychology proper and ethics of the "subjective" or immediate sort; and the only "moral" and humanistic studies were those called by Comte "sociology," viz., history and "objective morals." Crowning all was "logic," a chair in which Barreda himself took his seat—having before this taught law, medicine, and physics. "Logic" was the defence, the justification and amplification of the Comtist thesis of Positivism, worked out in theories of science, history, and education, together with the logic of inductive science as given in J. S. Mill's 'Logic.' Barreda for some years held this structure together, despite the assaults of the humanists and more particularly of the utilitarians, by force of the personal expositions and arguments given in his lectures. The fate of departments previously central in the educational scheme is revealed in the fact that the classical languages were neglected, except the study of "roots," considered likely to be useful to medical men, lawyers, etc.! Such a scheme, apart from the philosophical basis of it, is more or less familiar to us in the courses offered in some of the "scientific" schools of our own country. In Mexico the example was followed more or less closely in many of the confederated States in which schools of the "college" grade were founded. Indeed, higher education in Mexico is to-day decidedly "Comtean," both in theory and in practice.

I may not follow up the fortunes of Barreda's institution. The modifications introduced under succeeding ministries were, however, mostly motived by utility. Dentists and veterinarians could not see the need of spending years in the study of botany, sociology, and the Comtean logic; and the Government had to heed the demand for short-cuts to the professions. The successive reorganizations, however, have not changed the basis of the curriculum, which remains definitely scientific and Comtean. The principal changes were made in the reorganization of 1896, under Minister Baranda, when the present Sub-Secretary, Sr. Chavez, secured the introduction of semestral units in place of the yearly units, and was thus able to correlate and articulate the studies much more rationally. His own ideas, together with a full history of the movement started by Barreda, are to be found in his excellent monograph on 'Mexico, Its Social Evolution.'

Apart from its interest to students of philosophical and educational history, this Comtean incident illustrates the initiative and independence of strong men in Mexico. No "home-products" cry nor protests from vested interests could prevent a Barreda the politician from carrying out the plans of Barreda the philosopher and reformer. And a less superficial examination convinces us that, for the Mexico of to-day, exhibiting the economic and political moments of progress that it does, a Positivistic and scientific, a pragmatic and directly utilitarian, education of the mass of the students is best for the State. The motives of poverty, widespread illiteracy, urgency of competition with outsiders, principally Americans, must be for some time to come controlling, where the problems are those of the development of mining and agricultural resources and the training of men to administer still undeveloped States. One is somewhat surprised when first told that there is in the Government a Ministry of "Fomento," promotion! Yet in California the "promotion bureau" is a familiar fact; and our Government is establishing departments of commerce, labor, immigration, etc., that partake of the "promotion" idea. Mexico may be glad that at a blow Barreda destroyed the plants of classical, linguistic and theological mediævalism—all but the "roots"! Otherwise there would have been the long fight we are still waging to destroy the linguistic fetish that remains enthroned in many of our educational temples.

I have already referred to the reform wrought in finance by the present Government. The part of President Diaz appears in his robust—some say "dictatorial"—use of his judgment; I think "robust" is the better term, because it is part of his judgment to get the best advisers. He entrusted the financial reforms to Limantour, a native Parisian, and he has just constituted the board of "controllers" of finance of nine men, five of them foreigners. Foreigners are called in with remarkable broad-mindedness and wisdom. The director of the School of Fine Arts is none other than the distinguished Spanish painter, Fabres. It is expected that the new university will be equipped with the best men, regardless of nationality.

President Diaz is at present working out a policy of railway control which he himself thinks will anticipate the problems President Roosevelt is now dealing with. The prime idea is to have the Government itself own either a competing line or the controlling interest in a single line wherever combination would be likely to destroy competition. It is in pursuance of this policy that the Mexican National is made to compete with the Mexican Central, and that the charter of the new Tehuantepec Trans-Isthmian Railway reserves to the Government at least one-half of the stock. The President's plans for the further development of railway facilities, particularly in the west-coast direction, are truly fine, and he takes justifiable pride in referring to it. In a conversation on the subject, in answer to my question as to the possible invasion of Mexico by our railway magnates, he pithily remarked.—"They may suck the sugar, but they shall not bite it!"

Among the projects in which he is deeply interested is that of the construction of a great inland harbor, with docking facilities at Salina Cruz, the Pacific outlet of the Tehuantepec Railway. When completed, at enormous expense, it is expected that this line of trade will be a first-rate competitor with the Panama Canal; and it will have the advantage of being established and doing business first. Such schemes show both daring and wisdom, and only a Government of robust judgment and of really dictatorial powers could have compassed them as the Diaz Government has done.

Another line of policy illustrating "robustness" tempered by "moderation" is that adopted in the administration of the religious Reform Laws of 1863. In consequence of the moderation of the policy of suppression of the Catholic orders, there is to-day no strong Conservative opposition party in Mexico; everybody is Liberal. The orders as such are suppressed; no more than three persons bound by religious oaths can live together; no gatherings, processions, religious demonstrations of any kind are allowed in the open air—hence the absence of the Salvation Army from Mexico; but the charitable agencies, the female orders whose work is socially valuable and of merciful intent, still do their work, and their modes of life and system of organization, when motived by such ends, are not too closely inquired into.

The quality of moderation is indeed that which most forcefully strikes the observer of recent happenings. Among the events of great importance of the last year in the internal affairs of Mexico was the abolition of the Free Zone. The Free Zone was a strip of country on the Texas border, in which, by an enactment long in force, the tariff duties on imports from the United States were merely nominal. The economics of this policy was based on the expectation that this strip of territory, having practical free trade with the States to the north, would develop with them in many material ways—manufacturing, mining, etc.; the conditions of import of raw material, manufactured tools, building materials, machinery, etc., being those of free trade. But this expectation failed utterly; I have no space to discuss the reasons why. The policy amounted simply to granting sectional legislation to this zone, with no corresponding advantage to the country at large. Now it has happened this year that President Diaz has voluntarily surrendered a certain prerogative whereby the Executive might decree modifications of the national tariff; but, before surrendering it, his last act under it was the abolition of the Free Zone, by a decree to go into effect the following day! In a certain state paper recently printed it was said, with beautiful directness, that such suddenness and celerity in starting the new order was necessary for urgent reasons of public welfare. One does not have to use much imagination to supply the "reasons." Think what would follow upon a proposal to change preferential legislation of any sort in the United States, be it sectional (such as a change in our Chinese exclusion law), or industrial (such as a change in the sugar schedule). Once decreed, and in effect the following day, this reform marked a robust act of judgment; and it is said that the support of the "Free Zoners" themselves testifies to the moderation that made such an act the last of its kind by voluntary surrender. Only the vested interests of the territory were greatly stirred up.

Reflecting on this sort of government, one may say, "After me the deluge!"—and, of course, on a plane polished by the continuous action of a glacial mass moving in one direction, floods are possible. But one finds that the Mexicans have no such fear. They have now so large, well-chosen, and well-organized a force of able public men that things seem stable. Moreover, had one the chance to do so, certain more profound reasons might be expounded for thinking that things are stable. Diaz has been President, with but four years' intermission, since 1877; his robustnesses have been matched by his moderations; and the political student has a right to expect that a third of a century of such amazing accretion to the "funded contents" of the national life will be not only a monument to a man, but also the permanent body of a great State. J. Mark Baldwin.

THE ARTS AND CRAFTS IN LONDON.

London, January 20, 1906.

The Arts and Crafts Society opens an exhibition in London only once in every three years. Now that the giving of exhibitions is so overdone in London, as everywhere else, this shows admirable restraint, and the Society should be given the credit it deserves. But the policy is one burdened with responsibilities. In three years craftsmen have time for much good work and many experiments; the longer the interval between exhibitions, the more is to be expected of the exhibitors. "Much may happen in three years," Mr. Walter Crane, President of the Society, writes in his "Foreword" to the Catalogue; "and movements and phases in art seem to quicken their pace in our time, and are more rapid, both in their appearances and disappearances, perhaps, than ever before." From the exhibition that has just opened at the Grafton Gallery, one has therefore every right to expect a great deal in the way of good work, and more in evidence of the present tendencies and manner of development of the arts and crafts in England.

But to go to the Grafton Gallery with this expectation, it must be confessed, is to be grievously disappointed. People who are interested in the subject can hardly deny their disappointment. In finding a reason for it some may regret the arrangement of the exhibition, many good things, they say, having been thrust into corners, sacrificed to the decorative effect of the collection as a whole; others suggest that the Society, in the eighteen years of its existence, has so well fulfilled its mission that the general standard has been raised throughout the country, and we are no longer struck with work we should have thought far above the average at the start. That explanations are made, however, only proves the need of them. But I think when the work is examined, it will be found in itself to account for all the disappointment. If the general average is higher, and I am not by any means sure it is, signs of individuality are fewer; you cannot hide the larger exhibits, like the big pieces of furniture, the cartoons for stained glass, and so on; and if any strong tendency is revealed, it is in the readiness of certain exhibitors to stoop to the popular fads of the moment, and of the Society to grant them a prominence hardly justified by the quality of their performance. Let me explain.

In the beginning, when William Morris was the great power and the leading influence in the Society, much space was devoted to the crafts to which he had paid special attention. There were sure to be carpets, wall-papers, silk and crétonne hangings, stuffs of many kinds, even tapestries on memorable occasions. There might be plenty of reason for criticism—the products even of the Merton workshops were not always above reproach. But at least there was activity, a healthy striving, and often fine accomplishment in some of the most important decorative arts—the very arts that were in sorest straits at the moment of reaction against Victorian insipidity, Victorian vulgarity—the very arts upon which the seemliness of our daily life depends. And how are they now represented? I have discovered only one or two examples of carpet, and they were of no marked character, one way or the other. The wall hangings, save for a few stray examples here and there, are restricted chiefly to the printed cottons and linens by Mr. Lewis F. Day, pleasant in color, sound and simple in design, looking all the better for being well arranged together so that some sort of comparative idea can be had of them, but not of very great distinction. Occasional designs for wall-papers, hung separately, lost in a mess of cartoons and embroidered and decorative panels, have left with me no impression whatever. As for the furniture, there is a fair array of it, but nothing of real note. Tables, chairs, sideboards, desks, either follow old models so precisely as to be little more than copies—and it is then, to be honest, I like them best—or else they rush into exaggerations which I have been told I should not mind because they are without a trace of the swirls and whirligigs and absurdities of *L'Art Nouveau*, but which I find as restless and affected and foolishly self-conscious in their own way, as conducive to nightmare.

There is, for example, a dresser designed on harmless primitive principles by Mr. W. R. Lethaby, simple enough in form, but painted all over by Mr. Alfred H. Powell with a design so violent in its sharp greens, so broken in pattern, that it fairly jumps at you as you go in the gallery, and it is long before you can readjust your vision so as to see anything else. To have it always in the room with you where you eat, would be to suffer from chronic indigestion until the London smoke and the London grime had dulled it. There is also a sideboard, designed by Mr. George Jack, that, though in a much more ambitious way and with much more costly materials, shows something of the same defects of forced color and restless design; curves and twists and inlays wherever there is a chance for them, and the inlays arranged into a large florid pattern with none of the refinement which craftsmen, even in England, once knew how to give to their furniture. The glass is better, though there is not much of it, and it is sent by Messrs.

Powell, the excellence of whose work is not of to-day. The pottery, too, is interesting, or that which comes from the Ruskin Pottery in Birmingham, and, more particularly, from the Pilkington Tile and Pottery Company near Manchester, where recent experiments with glazes hy Mr. Joseph Burton and Mr. William Burton have led to some results of genuine technical importance. I wish I could say as much for the hrass and metal work. It is extraordinary that the new need for electric fittings, for instance, has so far produced mostly abortions, things one would not be willing to have in one's house. The best attempt I can recall is nothing more nor less than a new version of the beautiful old Dutch lamp, the lines ruined with every variation from the original. However, in all these different sections, the work, good or bad, is at least serious, designed and executed by practical craftsmen. They may be mistaken in their experiments, they may be trivial in their standards, they may be feeble in their workmanship; but they are craftsmen who have been trained in their craft—workmen who are at work and not at play, and who make you realize this in what they do.

It is another matter when you turn to some of the other exhihitors and their exhibits. In the sections which have been contributed to most largely and liberally I seem to be conscious of the amateur everywhere. Take, ahove all, the jewelry. A few years ago there was seldom more than enough to fill two or three or four cases, and if much of it was affected in its deliberate roughness and rudeness, it was also, as a rule, the work of artists with some sense of the quality and possibilities of their materials, with some feeling for pattern and color. For one reason or another, their jewelry became the fashion. Unfortunately, the roughness they cultivated as a virtue was only too easy to emulate. Besides, they made elaborate use of enamel, and it would be difficult for the merest dabhler in enamels not to get some agreeable passages of color out of his crudest experiments. As a consequence, innumerable people, mostly women, set to work producing jewelry. Enamels blossomed forth in every small studio and every small show; ornaments even a peasant might have thought coarse were supplied in a quantity for which I earnestly hope there was no corresponding demand. The thing grew into a positive nuisance. But now, here also at the Arts and Crafts, there are cases upon cases of necklaces and brooches and combs and rings that make you go back with relief to the ordinary jewelry of commerce as you see it displayed in Bond Street shops. Of course, in such an enormous assortment a great deal reveals technical skill and intelligence and finer qualities still. Mr. Alexander Fisher in his enamels and silver work, Mr. Paul Cooper in his jewelry, are artists both. But there is far more that never should have been produced at all, much less shown; that never would have been, probahly, had not the "new" jewelry offered an easy way to the exhibitors who wanted to be in "the movement" and to be paid for it at the same time. I do not know upon what principle this mediocre stuff was accepted by the selecting committee in such excessive quantities that the exhihition looks like nothing so much as a huge bazaar. The worst of it is that an artist like Mr. Harry Wilson, who has really done admirahle things, is not represented. Nor is Mr. Nelson Dawson, who is in a great measure responsible for the whole movement, but whose work, though it has never equalled Mr. Wilson's in refinement and delicacy, often has charm and beauty.

The making of books has suffered from the same causes as the making of jewelry. Kelmscott and Birmingham have much to answer for as leaders of mere fashions. There are innumerable examples of printing and illustration and book-binding, among them many of merit and distinction. The work of the Chiswick Press is usually excellent; the type good, the pages well spaced, the titles well balanced, the fact that the chief end of a book is to be read never lost sight of. The Doves Press also turns out good work, though there I fancy the beauty of a book to look at is considered more than the convenience and comfort of the reader. Here and there are interesting illustrations, none more amusing and more technically accomplished than M. Lucien Pissarro's color prints. Mr. Cohden-Sanderson's book-bindings have dignity and sobriety, and never flaunt their originality in your face. But in too many of the exhibits in this section affectation or a feeble amateurishness is a more obvious quality. The trail of Kelmscott is over it all, and the Birmingham conventions, now that Birmingham clings to them less persistently, seem to have set the standard for the illustrations. The shadow of the fad falls too heavily over the beautiful book as it is made to-day; modern conditions and improvements are the last things remembered.

Mr. Crane, referring in his "Foreword" to crafts that are "rather the especial growth of recent years of revival," mentions calligraphy and illumination. But growth seems to me the last word to be used in this connection. Had it not been for William Morris, amusing himself after his own fashion in his leisure hours, there surely never would have been such a revival. For beautiful and splendid as the old illuminated manuscripts were and are, the craft that created them is one that has had its day, that was killed forever by the printing-press. It may be the fad of a few people to-day to add to their lihraries modern specimens, but it does not follow that, therefore, this craft will ever again develop into a healthy living one. It cannot as long as conditions are what they are. And yet, in the self-conscious revival of the old arts and crafts, we find even schools like the London County Council Technical Schools, that ought to be of all things practical, running classes of calligraphy and illumination, and sending examples to the present exhihition.

I have said nothing of the cartoons for stained glass, hut it is difficult to say anything. The designs cannot be fairly judged until they are executed in the medium for which they are prepared. Two or three by Mr. R. Anning Bell have a feeling of dignity and simplicity, so promising that I should like to see them when carried out. Others, by Mr. Holiday and more particularly by Mr. Christopher Whall, make me feel the wisdom of reserving one's judgment. Mr. Whall's windows, when set up in the billiard-room for which they are intended, may he so fine in color that nothing else will count, but in the cartoons it is hard to see anything but the inappropriateness and childishness of the design, with its little winged Cupids. The embroideries are many, some good, some amateurish. There are bronzes and wood carvings and leather and gesso work—there is too much, really: over six hundred numbers in the catalogue, and (as in the cases of books and jewelry and embroidery) one numher often stands for several exhibits. Naturally, the proportion of good work is fair; it would be melancholy if it were not. But it is not possible for me, here, to go into detail. I can only try and give an idea of the general tendencies, of the manner in which the movements and phases Mr. Crane refers to in his "Foreword" are represented. I am afraid I cannot quite believe with him in a steady growth and development. The very countenance given by the Society to amateurish effort and the poses and pretensions of the moment is discouraging. The fact that municipal schools have been allowed to contrihute is, I think, a drawback. An exhibition of this kind should be one of the hest artists and craftsmen in the country, not of students, who have always a chance to exhibit elsewhere. The inclusion of so much of their work adds to the look of a hazaar which is so distressing and confusing. Besides, too often, their work is a direct concession to the affectations and passing fashions I have been deploring. It may he that, had the selecting committee been strict, had half the exhibits been refused, had the schools been excluded, the exhihition would have suggested a more hopeful outlook. But I doubt it. Artists and craftsmen, less sanguine than Mr. Crane, seem themselves conscious of retrogression rather than advance in the years since the Society was estahlished. Some of the younger men have gone so far as to declare that the revolt from tradition, the original reason for the Society, has heen disastrous. and that the one hope is in a return to tradition. But that return will not he by way of a revival of worn-out crafts and deliher-ate primitiveness.

Correspondence.

THE DISAPPOINTMENTS OF UNIVERSAL SUFFRAGE.

To the Editor of The Nation:

Sir: In two recent hook reviews in your columns I find considerahle food for reflection. Mr. John F. Hume is quoted as saying in 'The Abolitionists' (Putnams, 1905):

"One of them [the two great political parties of to-day] may pass perfunctory resolutions against the Philippine crime, but dares say nothing ahout the treatment visited upon the negro. The other may say a few compassionate hut meaningless words for the negro, but cannot denounce the oppression of the Filipinos. Both [parties] are fatally handicapped hy their connections and committals. Both are in fact pro-slavery, although the one in power, hecause of its responsibility for existing conditions, is the more criminal of the two" (p. 86).

It is, of course, both false and absurd to say that the people of the United States

are in favor of negro slavery, and it is at least doubtful whether either political party is solely responsible for existing conditions in the South. But the point for reflection is the substantial unanimity of both parties—that is, of the entire people of the United States to-day—in regard to the political status of the negro in the South. There the negro is now practically debarred from voting. This fact is well known to the rest of the nation, and the rest of the nation acquiesces. Forty years ago the negro was given the ballot, legally, by and with the consent of a large majority of the citizens of these United States. To-day he is deprived of that ballot, practically, by and with the consent of a large majority of the citizens of these same United States. Sifted to the last analysis, the reason for the disfranchisement of the negro lies in the popular conviction of his unfitness and incapacity for intelligent political action and coöperation—as a race, with several obvious individual exceptions. In the sixties it was believed, or fondly and rashly hoped, that the negro race, fresh from the wilds of Africa, could at one bound attain the political habits which the Anglo-Saxon race has acquired only by countless experiments, repeated failures, and slow advances. Ignorant of the cardinal principles of anthropology, and unmindful of the patent lessons of human history, our legislators at the close of the war looked for what, had it happened, would have been a miracle. Time has shown that they looked in vain, and if we of to-day are perfectly frank with ourselves, we must acknowledge that the negro race in the South, with numerous individual exceptions, whatever its future development may turn out to be, is not now fit for intelligent participation in representative self-government.

We are, indeed, beginning to learn that there are exceptions to that optimistic rule of our immediate ancestors, which declared that every human being of twenty-one years of age and wearing trousers was *ipso facto* a fit and desirable equal political partner in self-government. More and more exceptions to this rule are presenting themselves to our national consciousness day by day. We are approaching, if we have not already reached, an age of questioning, of doubt, as to the fundamental truth of once firmly believed political dogmas. The public mind moves slowly and tentatively, but an object-lesson of forty years' standing seems to have at length brought conviction, and, whatever may have been the causes, the fact remains that the negro race of the South to-day—with numerous individual exceptions—is not generally regarded as a safe or capable political partner in Anglo-Saxon representative self-government. Neither political party in the United States is willing to acknowledge this in so many words; but, representing, as these two political parties unquestionably do, the views of the vast majority of the people of the United States, there can be no doubt as to the national attitude towards this subject. A political idol has been smashed, but we had rather not say anything about it in public—yet we know it is smashed.

Another lesson of rather an important character, in what might be called the psychology of politics, is afforded by the review in your columns of Paul's 'History of Modern England' (Macmillan, 1905). The psychology of the working class, the mental furniture of the laboring man, seems to have been completely misunderstood by British legislators during the last half century. For reasons not altogether apparent to the historian and anthropologist of to-day, it was the hope and belief of Gladstone, Bright, and Cobden that the British workingman, when granted the ballot, would be solidly opposed to war in any shape; he would concentrate his efforts on useful domestic legislation, would accept the ballot with eagerness and thankfulness, and, above all, would be sympathetic with all those oppressed and mistreated fellow-mortals under other Governments who were striving for those same great political blessings which the British workingman enjoyed. That is what was expected. History shows that results hardly tallied with expectations. The British working class showed no particular desire for the franchise, when granted them, though the theory all along had been that they were fairly aching for it. In the next place, they manifested a most distressing and disappointing fondness for war. They flocked to the Boer war without question; they were ready to fight Russia in 1877, and probably are just as willing now to fight Germany. The struggles of the Boers for liberty and independence excited with the British workingmen just about as much sympathy as our workingmen display for the Filipinos. In short, the British workingman, almost indifferent to the gift of the ballot, showed that he was simply a human being, with the usual passions, prejudices, frailities, and shortcomings of ordinary human nature. The ascription to him of extraordinary virtues and superhuman qualities was both absurd and pernicious. In Great Britain the workingman's vote is to-day probably as intelligent as that of the ordinary clerk, small tradesman, and small professional man—but the point is, that, contrary to expectation, it is no more so.

The half-century's experience of these two kindred countries, Great Britain and the United States, is in some respects quite similar. In both countries the Legislatures, with the consent and support of their constituencies of course, made a practically gratuitous gift of the ballot to a class at that time totally unexperienced in, and probably indifferent to, the problems of self-government. With us the negro has failed to reach the level of average citizenship essential to the successful operation of a self-governing representative country; in Great Britain, the workingman has failed to go above that level. In neither country has either class responded to the original expectations entertained for them. The wonder is, why they were ever expected to.

Mr. Hume's work on 'The Abolitionists' brings clearly to mind the popular misconception and overestimate of the negro's character. The miscalculations of our British doctrinaires and closet philosophers regarding the workingman's actual character are amusing, and not altogether distressing. With us to-day in the United States, the question is whether we shall persist in trying to make human nature conform to a palpably defective political institution, or shall adapt the institution to suit the needs of American human nature.

E. L. C. Morse.

POULTRY RAISING.

To the Editor of The Nation:

Sir: Your note in the *Nation* of February 15 discouraging the keeping of poultry on a large scale seems to me to overlook the fact that any number of small flocks, as kept by the ordinary farmer, does not and cannot keep the market supplied with fresh eggs. The ordinary farmer is altogether too careless in gathering his eggs (frequently only every other day), and in keeping them in a warm place, where they will, inside of a week, acquire the "gunpowder" if not the musty taste. Even if he doesn't hold them for higher prices, the means of getting them to market are irregular and uncertain. Most commonly he takes them to the village store once a week, where they lie till a case is filled, and are then sent to the city. Farmers' eggs may easily be three weeks old before they are consumed.

The larger poultrymen, on the other hand, are much more careful in gathering their eggs, and ship by express at least once a week direct to their customers or jobbers in the city. Personally, I handle hundreds of dozens weekly from the largest farms in Connecticut for New Haven and New York private and hotel trade; and for ten months of the year, since practically all my eggs are not over four days old when delivered, I have almost no complaints; but in October and November when the old hens are moulting and the new pullets have not begun to lay, I have to resort to the small farms, and then my trouble begins. I keep my trade because I make tours all over the State, getting others to pick up eggs for me, but I do not sleep nights. And this condition of things will last until an industry in which there is more money invested than in any other in this country has plants suited to its size. The market for strictly fresh eggs is inexhaustible.

After apprenticeship on the large farms of Petaluma, California, where poultry-keeping is the one industry that supports the town, and of the well-known farms of central New York in addition to my own farm, and acquaintance with conditions here, I also take issue with the statement that poultry-keeping does not pay. Build your houses on the colony plan near a brook, and your hens will need no more fencing or food than if they were always at your back door and in the kitchen, and they will get their water for themselves ten months in the year. Do the work yourself, take infinite pains, and nothing will repay you better in all honest ways, or more fascinate you as a growing science, than the incubation, artificial brooding, and caring of poultry on a large scale.

Yours in sincerity,

Robinson Smith.

Che hire, Conn., February 19, 1906.

THE FARCE OF MASTER PATELIN.

To the Editor of The Nation:

Sir: In your recent review of 'The Farce of Master Pierre Patelin,' regret was expressed that I had not given the entire original text of Patelin along with my translation. Allow me to say that my critical edition, to be out within a year or two, will contain a reproduction in facsimile of

Pierre Levet's whole text. Meanwhile, Mr. Albert Rosset of Lyons is having his unique exemplar of Le Roy's edition, printed about 1485, reproduced in facsimile. This book will be published within a month, and is likely to be eagerly sought by booklovers, for Le Roy's edition of Patelin is almost beyond doubt the first printed book containing the text of a comedy written in a modern tongue.

Whoever is interested in these two ancient books, will find an article on them in *Modern Language Notes* for March, 1906.

Very truly yours,

RICHARD HOLBROOK.

NEW YORK, February 24, 1906.

Notes.

"Édition de luxe" is not exactly a fit designation of Francis D. Tandy Co.'s new and enlarged "Gettysburg Edition" of Nicolay and Hay's 'Speeches and Letters of Abraham Lincoln.' Neither enlargement with new matter, nor the title 'Complete Works of Abraham Lincoln,' nor yet a limitation to 700 numbered and registered sets, ensures a luxurious product. The Nicolay and Hay edition was in two volumes of irreproachable but very condensed typography; the buff paper made some amends to eyesight. The present can be read much more easily because of larger type and wider spacing, but the paper is a dead white. On the other hand, there are numerous portraits, mostly familiar. The first interpolations are four in the period 1832 to 1836, where Nicolay and Hay gleaned nothing. In 1837, a Bank speech before the Illinois Legislature has now been disinterred from a newspaper. Between "de luxe" and additions, these first two volumes (1832-1858) demand more than 700 pages as against the original 240 of Nicolay and Hay's volume i. Some of the accretions may be thought valuable; most are at least characteristic. Mr. Lincoln's early low plane of anti-slavery principle is made renewedly evident.

A number of decidedly unhandy volumes on our table approach the category of books that are no books. Such is the composite quarto, 'The New York Stock Exchange,' of which E. C. Stedman is the general editor (Stock Exchange Historical Co.). It is showily, rather than elegantly got up, and most of the illustrations are familiar antiquarian woodcuts in the text. A second part is yet to appear. In the present, panics and other financial crises are narrated at sufficient length; not always with sufficient reserve, nor always quite accurately. An oblong folio with red sides and white backing is the 'Society of Colonial Wars in the State of Maryland: Genealogies of the Members and Record of Services of Ancestors,' published in Baltimore under the editorial direction of Christopher Johnston, M.A. Each pedigree occupies a page or more, and is neatly displayed. The services are grouped at the end, and here the New England ancestors hold a prominent place. The work has been admirably executed. Finally, the Rhode Island State Society of the Cincinnati puts forth a tall octavo, 'The Order of the Cincinnati in France ('L'Ordre de Cincinnatus'): Its Organization and History,' edited by Dr. Asa Bird Gardiner. It is handsomely printed and freely illustrated with portraits, from Rochambeau's to that of the retiring President Loubet (honorary member). The edition is limited to 350 numbered copies. The French Society was rudely dispersed by the Revolution, and nothing was done to reanimate it till 1887. Then it sought to regain its place in the Order, but we are left to infer that it has not fulfilled the condition—"whenever it shall permanently organize with a membership sufficient for the purpose." This volume may prove to contain the entire history of the Society.

'The Later Work of Titian,' as dealt with in one of the most recent additions to the Newnes-Scribner "Art Library," is that produced after 1540, or, if the traditional date of Titian's birth be accepted, after that artist had reached his sixty-third year and when he and the Renaissance had grown old together. He had still thirty-six years of activity before him, but to see the work of that period assembled and separated from what had gone before is almost to become an Oslerite. There is much in it that one must admire, but the pictures that one loves were nearly all produced earlier. There are imitations of Veronese and Tintoretto, as if our painter felt bound to contest the laurels of his younger rivals; there is a growing pomposity and emphasis in composition; there is increasing technical power coupled with deadness of feeling; there is an almost total absence of the pure joy in beauty which marked the painter of the so-called "Sacred and Profane Love." Finally, there is the evidence of commercialism in more than one canvas, culminating in such an atrocity as "Philip the Second Dedicating his Son, Don Ferdinand, to Victory"—a picture which he certainly acknowledged, and for which he claimed payment, but which it is difficult to believe that he even designed. Occasionally, as in the Borghese "Education of Love," he reverted to his earlier manner, as far as subject and treatment are concerned, but without the old spontaneity. It is in such strange and almost modern and impressionistic compositions as the Madrid "Entombment" that he is at his best. In these one feels the precursor of a new art rather than the belated practitioner of an old one. A remarkable picture of this period, and one of the most powerful if not in all respects one of the most agreeable, is Mrs. Gardner's "Europa." Its absence from this collection of reproductions is to be regretted.

Another issue of the same series is devoted to the 'Pre-Raphaelite Brotherhood,' and the plates give a fair notion of the work of Madox Brown, Holman Hunt, Rossetti, and the young Millais. Curiously enough, the earliest works of Rossetti, the only Pre-Raphaelite ones, are omitted. Certain inclusions in the list of illustrations are, however, harder to understand than the exclusions, and the prefatory text, by J. Ernest Phythian, gives us no light. Certain works by Gentile da Fabriano, Fra Angelico, Masaccio, Lippo Lippi, Mantegna, and Botticelli, together with the Ansidei Madonna, seem to answer no purpose here, unless it be to show what English Pre-Raphaelite work was *not* like. What it *was* most like is photography, and there can be little doubt that the Pre-Raphaelites, however unconsciously, were deeply influenced by the new discovery, which was destined to show men how different art is from nature. That the young enthusiasts should have thought the difference a proof of the faultiness of art was natural enough. Nowadays, so far from making art over after the pattern of photography, we are engaged in the equally hopeless task of trying to make photography an art.

Ford Madox Hueffer's 'Holbein,' in "The Popular Library of Art" (Duckworth-Dutton), is agreeably written, gives a good summary of the little that is known of the life, and is justly appreciative of the painter. There is not much detailed criticism or analysis, and one looks over the pages for detachable passages with some surprise at their rarity; but a picture of the man and of his art is somehow conveyed to one, and one rises from the perusal with a clearer notion of what it is that one has always admired. Holbein is eminently reproducible, and the illustrations of the little volume are therefore more successful than ordinary, and come nearer to doing justice to the originals. The book is a worthy successor to its fellows in one of the best of the many series of popular books on art.

A little work on the Philippines which has made no appeal to the general reader, yet which is worth the attention of every one interested in the subject, is a little 'History of the Philippines,' prepared originally for use in the Philippine schools by Dr. David P. Barrows (American Book Co.). Dr. Barrows composed it at intervals while he was superintendent of schools in Manila, and later chief of the Philippine Ethnological Survey; and, now that he is general superintendent of the Government schools, he does not feel like making his own book the textbook. This is really a pity, since it so nearly fills the needs of the Filipino, who has no historical outlook, inasmuch as it deals with Philippine history in relation to that of the world at large. While subordinating the Philippine text and subordinating the events of Philippine history to the broader view, it at the same time affords the best brief survey of the history of the islands and the islanders themselves that has yet appeared in the English language. For this purpose it may be commended to all readers who seek something more than a mere string of chronicled events drawn from sources both authentic and unauthentic.

'Days of the Past,' by Alexander Innes Shand (E. P. Dutton & Co.), is one of the innumerable collections of reminiscences which seem to have become the dominant note of present-day literature. We have reached a point where no self-respecting person who has passed the age of sixty and has mingled to any extent in political, literary, or artistic society can quit the stage with propriety unless he has put on record everything within his recollection that can throw light on the history of his time. Unfortunately for their readers, the writers of these books do not always confine their lucubrations within such beneficent limits. Mr. Shand's peculiar weakness is gastronomic. He delights to record his various experiences in eating and drinking, and is evidently proud of the adaptability of his taste and of his capacity to deal with the different kinds of meat and

drink he has encountered. On the other hand, his chapters on the changes in London and on Old Edinburgh, and his literary recollections, are both interesting and valuable. He was for years on the staff of the London *Times*, and was also a contributor to the leading reviews, so that he made the acquaintance of many well-known people, and what he has to say about them is quite worth reading.

Human nature is ever the same, and the cult of Napoleon has thousands of devotees, while Emerson and Goethe sink into comparative obscurity. From Prince Victor Napoleon with his priceless collection of heirlooms and relics, to the humble hut proud possessor of a single and not indubitable Waterloo bayonet, the gradations are numerous; in these gradations Mr. H. M. Broadley occupies an honorable superior position. The catalogue of his collection, 'Collectanea Napoleonica,' compiled and published in London by W. V. Daniell, is well turned out and agreeably illustrated, although his entries, especially of books and pamphlets, decidedly reveal the amateur. His strong point is undoubtedly autographs, in which his collection is about complete. In other respects completion is an impossible ideal; in England alone it is computed that 1,700 caricatures of Napoleon have been published, while of portraits and engravings illustrating his life M. Mayer of Paris believes that some 80,000 have appeared. Mr. Broadley is, however, decidedly strong in caricatures, portraits, maps, etc., and the catalogue will undoubtedly prove useful to collectors and students. It may be of interest to add that probably the finest collection of caricatures of Napoleon at the present day is that of Mr. Latta of Philadelphia, and that our ambassador in Paris, Mr. McCormick, is the owner of one of the best collections of Napoleon portraits.

'Sveriges Bibliografiska Litteratur' is the title of a work of which the first two instalments have accompanied the annual reports of the Royal Library at Stockholm for 1904 and 1905. They embrace the bibliographical literature proper, while the two remaining parts will be devoted to the literature of libraries and archives, and to printing and the book trade. The compiler, Dr. J. A. Almquist, has, of course, had at his disposal a practically complete collection of the literature of Sweden, and has certainly bestowed great care on the preparation; not only bibliographies in the strict meaning of the word, but everything that has any bibliographical bearing at all has been included. Bibliographical publications of Swedes printed in other countries and publications about Swedish literature by foreign writers are enumerated, along with works printed in Sweden. Particularly important is the inclusion of biographical dictionaries of special classes of men, and registers of officers of universities and schools, which quite often contain lists of the publications of the writers they include. The only similar work of the same scope and comprehensiveness which has been published is Ottino and Fumagalli's 'Bibliotheca Bibliographica Italica.'

The December (1905) number of the *Social Tidskrift* is accompanied by an index to the first five volumes of that journal, which depicts in a very succinct way the social movements in modern Sweden. A very large space is occupied by discussions of the various phases of the popular educational movement which has taken such a strong hold on the educated classes within the last ten years—the public-library movement, public lectures, summer extension courses, etc. Other matters which have received attention are: laborers' dwellings, the struggle between employers and employed, emigration, the treatment of the poor, coöperation, the temperance question, social hygiene (*e. g.*, the work against the spread of tuberculosis), etc. Social work has received a new impetus in Sweden since the break with Norway. Many of the younger men especially feel that concentration of efforts on the lines of social progress, and unification of the forces of the country towards a single aim, are more imperatively needed now than ever before, as was pointed out in an editorial in the *Social Tidskrift* last summer.

The *Geographical Journal* for February contains our American mountaineer, Mrs. Fanny Bullock Workman's, account of her and Dr. Hunter Workman's record-breaking ascent of the Himalaya. The main object of their expedition was the exploration of some glaciers near the Kashmir border, in the course of which she climbed a peak 22,568 feet high and her husband one 23,394 feet. A remarkable thing about these great altitudes was the sudden changes from heat to cold. At one camp the sun temperature at 1:30 P. M. was 170 degrees Fahrenheit, and the heat was enervating, while by five it was freezing. Some interesting reproductions of photographs and a map of the region are given. Other articles are upon the bathymetrical survey of the lochs of Scotland, the climatic features of the Pleistocene Ice Age, by Prof. A. Penck, and the English Ordnance Survey maps. In respect of these, Dr. F. J. Haverfield recommends that the ancient remains, earthworks, tumuli, ruins, etc., should be more fully and carefully put upon the maps so as to make them a complete and accurate archæological record.

The material development of Egypt is making remarkable progress, largely through the aid of foreign capital. In the last few years 119 companies with a capital of $166,500,000 have been registered. This means an investment of $17 per head of the population, a figure which would be far larger were the many foreign banks and private companies included. Another indication of this industrial progress is the increased buying capacity of the people. Consul-General Morgan of Cairo says that up to the end of August the general imports were valued at nearly $5,000,000 over and above those of last year, the largest increase being in cotton fabrics.

In the *Beilage* of the Munich *Allgemeine Zeitung*, No. 290, a well-known German traveller, Robert Kirnberger, gives, on the basis of his own observations, a very instructive account of the present and prospective French railroad from Algiers to the Sudan. The writer declares this to be a "riesiges Kulturwerk" upon which the French have been for years quietly engaged, and which, when completed, will cope with the Cape to Cairo road in importance for the inner development of the Dark Continent. He compares, also, its value as a factor in civilization with the roads connecting the Atlantic and the Pacific in this country. Supplementary to this, we find in the new series of the *Beilage*, No. 4, a full discussion of the projected and partly completed three great transcontinental telegraph lines of Africa—first and foremost the great Cape to Cairo line; then the line that is to cut through the heart of the Dark Continent from West to East, from the mouth of the Congo to Dar-es-Salam; and, thirdly, the Trans-Sahara line connecting the coasts of Algeria with the West African coasts. The exact status, prospects, and far-reaching importance of all these projects are given by the writer with a wealth of detail.

The turning of temples into school buildings is the latest and in some respects the most interesting manifestation of the progress of education in China. At Hai Cheng, a city in southern Mantchuria, a normal school for the preparation of native teachers under the direction of two Japanese has been established in a famous temple to Confucius. At a recent visit to the city United States Consul-General Sammons was invited by the chief magistrate of the district to address the ninety-nine students, and they were greatly interested in what he told them of the method of conducting primary and grade schools in this country. They are being taught reading, writing, mathematics, and geography as well as physiology, history, and other high-school subjects. A Buddhist temple has been converted into an industrial school for carrying out modern prison-reform methods. Long-time prisoners are being taught to spin and weave, make wire lamp screens and other useful articles, and in addition to improve the roads and build drains. Magistrate Kuan has also organized a commercial club, to which the consul by invitation described American commercial methods; has made arrangements to open a school for Chinese girls in the Confucian temple, and has ordered a memorial to be erected to the late Rev. John McIntyre of the Scotch Presbyterian Church, who served the best years of his life in the Mantchurian mission field.

One of the consequences of the separation of Church and State in France is the fact that the theological faculties of Paris and Montpellier, the ablest representatives of independent and advanced theological scholarship in the country, will lose their income from the State, which has amounted to almost 150,000 francs per annum. A review announces that the project of uniting the two faculties had, for reasons of tradition and local interests, been dropped, but that it had been found necessary to reduce the number of chairs, in the one case from ten to six, and in the other case from eight to five.

Italy has recently lost one of its best scholars by the death of Dr. Severino Ferrari, who died at the age of forty-nine in an insane asylum in Tuscany. As poet and critic Ferrari earned the public applause of Carducci. For a number of years he was a teacher in the women's college in Florence. His reputation as a poet was established some twenty years ago when he published his "Bordatini."

In 1902 the New York University acquired the Hübner collection of Classical Philology from Berlin, embracing 4,000 bound volumes and 3,000 pamphlets. It is proposed now to make a modest addition to it as a memorial to the late Dr. Howard Crosby,

who was Chancellor of the University (1870-81), Professor of Greek, founder of the Greek Club of New York, and one of the company of revisers of the translation of the New Testament. Dr. Crosby was a man of mark among the scholars and philanthropists of the last quarter of the nineteenth century. He would have been eighty years of age on the 27th of February. Contributions, large or small, for the Howard Crosby memorial as above may be made to Prof. E. G. Sihler, or to Prof. Wm. E. Waters, University Heights, New York City.

—The excellences of Mr. Albert H. Smyth's 'Life and Writings of Benjamin Franklin' (Macmillan) begin to appear in the second volume. The carelessness in previous texts is corrected, omitted paragraphs are restored, and the notes are more full and useful. The prefaces to 'Poor Richard' are, with some exceptions, printed, and a number of "characteristic" contributions to the *Pennsylvania Gazette* take the place of certain essays which previous editors have accepted as Franklin's on insufficient evidence. In one instance Mr. Smyth has traced the author of two of these rejected essays, and in other instances he omits them because they are "dull and trivial." Internal evidence of authorship is usually an uncertain guide, and we fear some of the material included by the editor will be rejected by his successor. The omission of a letter to Colden, containing an erroneous theory of the diurnal motion of the earth, because Franklin desired the letter not to be reprinted, offers a dangerous precedent, and would justify the omission of any indiscretion in theory or expression—a fault to which Sparks owes so much of his disrepute as an editor. The "Dissertation on Liberty and Necessity" is also omitted, on the ground that to republish it would be an "injury and an offence to the memory of Franklin." It is certainly more proper to err in this direction than to exhume and to print the worst in the belief that everything may be sacrificed to completeness. The contents of the volume are better reading for the changes and contain more of the real Franklin. The charm of the almanac prefaces is still to be felt, and the earliest known productions of his pen, the 'Do Good Papers,' were well worth recovering, since they prove the strong influence which the form of the *Spectator* essay exerted on the young journalist, persisting even when the frank materialism of the almanac period had intervened. The lively characterization of Harvard College, the satire on elegies, the essay on "Shavers and Trimmers," and the "Apology for Printers" are distinct gains. Franklin's scientific papers and his early ventures in public usefulness occupy a good part of the volume. The editor's notes are excellent, but it is puzzling to know why the name of Jarman should have been explained only on its third appearance, and why a reference to Whitefield (p. 234) is allowed to remain concealed in the initials only. The origin of the Polly Baker paper has baffled the efforts of Mr. Smyth to trace it.

—In this connection may be mentioned some issues incident to Franklin exhibitions in various cities. Boston naturally leads with a list of exhibits and extracts from the Autobiography for use in the public schools—both the work of Lindsay Swift. The New York Public Library Bulletin gives space to Bigelow's theory of the authorship of the Shipley speech, and his account of a new statuette of Franklin; as well as to an excellent list of Franklin material in that library. The latter includes a very valuable list of Franklin portraits "grouped under the various originals on which most of them are based" —a true procedure for scientific iconography—compiled by Mr. Frank Weitenkampf, Curator of the Print Department. It fills nearly thirty-eight pages. Duplessis takes the lead, as might have been expected, but the prints after Cochin, Martin, and Chamberlin are also very numerous. Mr. Weitenkampf disdeserves the praise of a pioneer. The Grolier Club prints a catalogue of the portraits, manuscripts, and medallions brought together by its members. As is usual, the number of good or unique impressions is large.

—The two stately quarto volumes entitled 'Some of the Ancestors and Descendants of Samuel Converse, jr., of Thompson Parish, Killingly, Conn.; Major James Convers of Woburn, Mass.; the Hon. Heman Allen, M.C., of Milton and Burlington, Vt.; Capt. Jonathan Bixby, sr., of Killingly, Conn.' (Boston: Eben Putnam), cannot be regarded as exemplary genealogical editing. The actual compiler, Charles Allen Converse, will doubtless plead freedom from commercial restraint, as private liberality footed the bills of manufacture. This is evidenced as well by the extraordinary number of portraits (sometimes duplicated) in every generation (a very valuable feature), as by illustrations even of a dwelling house, farm buildings, the stock at pasture, and, finally, an old Convers chest. Not only the respective lines mentioned on the title page, but all the collateral, male and female, are liable to be treated with a fulness often surpassing that of the leading families, who are thus so obscured that you cannot see the wood for the trees. Inventories, sheep earmarks, modern notices of weddings, funeral eulogies and lodge resolutions, Sheldon's expedition to Canada, Lamberton's lost ship (1646), are plentifully and often wastefully introduced. In the end you may (if you have not had to pay for it) be thankful for what is thus pitchforked together rather than edited. Edward Convers came over with Winthrop in the *Arbella*, and was ferryman between Charlestown and Boston till 1640, when the privilege was made over to Harvard College. A final *e* was assumed by Major James Converse, of the third generation, a stout Indian fighter. On the other hand, the descendants of Benjamin Converse, implicated in Shays's rebellion, dropped the *e*. Sherman Converse first published Webster's Dictionary. Charles Crozat Converse, still living, has been musician and composer of wide popularity; inventor, lawyer, and manufacturer; proposed the pronoun *thon* (common gender), and got it incorporated in the vocabulary of the Standard Dictionary, which has been amber to it. The Rev. Ambrose Converse, D.D., a Northern man with Southern principles, made his pro-slavery Philadelphia *Christian Observer* so "coppery" during the civil war that Seward suppressed it and arrested him. The Allen, Bixby, and Bishop families, treated in as many different appendixes, derive from Ipswich, Mass. The assortment of queer female names in the Converse line—Cindrella, Lenna, Polina, Celestia, Dulcenia, Celenda, for a few—is unparalleled in our observation.

—Essex County, New Jersey, possesses a park system second perhaps to none, except the metropolitan system of Boston. It was established under a law passed in 1894 for a temporary commission to obtain such information as might be necessary to enable the public to judge of the desirability of such a system for the county. The commission, consisting of five members, of whom Mr. F. W. Kelsey was one, completed their work "in about half a year," instead of the two years allowed, and used less than half the appropriation for the purpose ($10,000). That commission deserves the greatest credit for the promptitude and efficiency with which it fulfilled its trust, and Mr. Kelsey is entitled to his full share as a most active and energetic member of it. A general law providing for a park system under control of a permanent commission passed the Legislature of New Jersey, "not a single vote having been recorded in either house against it," and was approved March 5, 1895. It contained a referendum clause, and was sustained by the people at the general election, April 9, 1895. Mr. Kelsey was appointed on the permanent commission, his term expiring in April, 1897, when Mr. George W. Bramhall was appointed to succeed him. During these two years Mr. Kelsey devoted a large share of his time to the work of the commission, for which he deserves great praise. He now professes to have written 'A Complete History of the Inception and Development of the Essex County Parks of New Jersey' (New York: J. S. Ogilvie Publishing Co.), but it seems to us neither "complete" nor a "history." He does not give the text of the laws under which the park system was established, nor the details in regard to the acquirement of lands, whether by purchase, condemnation, or gift—there is only one short reference to lands given, not a word about the fine gateway to the northern division of Branch Brook Park, presented by Mr. Robert F. Ballantine. He does not give the history of the Heller litigation, nor the text of the decisions of the Supreme Court and Court of Errors and Appeals, sustaining the constitutionality of the Park act; he bestows no commendation upon Mr. Alonzo Church for his long and faithful service as secretary, nor does he mention the names of the commissioners who have died during their term of office. He gives abundant space to his own correspondence and to criticism of the commission and individual members of it, where their policy and views have not met with his approval. He has, however, gathered together much material which will greatly aid an unbiassed future historian.

—A rather unsatisfactory piece of bookmaking is the edition of 'In Memoriam, Annotated by the Author,' just published by the Macmillan Co. In size and binding the volume simulates the well-beloved Golden Treasury series, from which it is distinguished, however, by the lack of the familiar vignette title-page, as well as by less admirable printing. The look of the page is specially impaired by the use of

Roman numerals to mark the stanzas as well as the sections. In view of the uniform shortness of the sections, this innovation in the text is of doubtful advantage. Of the editorial apparatus very little is new. The "Introduction by the Editor," which occupies some twenty-five pages, is (though there is nothing in the book to indicate it) merely the chapter on 'In Memoriam' in the Memoir of Tennyson by his son, reprinted verbatim with a few omissions. In consequence, it follows that the three sections of the poem which appear in the introduction as "unpublished" have been in print since 1897. On general grounds, there is, of course, no objection to such warming-over of good material, but meticulous readers, at least, would have welcomed some statement of the circumstances.

—The poet's own annotations to his poem, which fill some score of pages at the back, are devoted to pointing out classical and Scriptural sources for specific lines, or to brief prose paraphrases of the more abstract stanzas. We have, for example, on the familiar section beginning:

"If Sleep and Death be truly one,"

this eloquent gloss:

"If the immediate life after death be only sleep and the spirit between this life and the next should be folded like a flower in a night slumber, then the remembrance of the past might remain, as the smell and color do in sleeping flowers; and in that case the memory of our love would last as true, and would live pure and whole within the spirit of my friend until it was unfolded at the breaking of the morn, when the sleep was over."

Along with a few bits of pregnant prose like this are some gratifying *ex-cathedra* explanations of certain puzzling allusions. Thus, the "one clear harp of divers tones" is now discovered beyond a peradventure to be not St. Augustine's, as has been hitherto generally supposed, but Goethe's, "among whose last words," says the note, "were these, 'Von Aenderungen zu höheren Aenderungen.'" And the "horned flood" which has evoked a good deal of fantastic exegesis, is explained as "between two promontories." Yet even the notes of this stamp lack novelty, for the substance of nearly all of them was communicated by Tennyson before his death both to the Rev. Alfred Gatty and to James Knowles, and was used by them in their commentaries on the poem.

GREENSLET'S LOWELL.—I.

James Russell Lowell: His Life and Work. By Ferris Greenslet. Boston: Houghton, Mifflin & Co. 1905.

In preparing this volume, Mr. Greenslet has neglected no source of information and enlightenment, whether from books or from persons. He has vivified his portrait by consulting Lowell's surviving friends—first and foremost, as a matter of course, Mr. Charles Eliot Norton; and has availed himself, also, of all the "oral tradition" which must soon entirely vanish. He has not only possessed himself *au fond* of Lowell's own works, and of biographies such as Mr. Scudder's and the Rev. Edward Everett Hale's, but he has gathered all the stray notices, English and American, and the scattered hints which furnish minute and life-like touches. He has examined, for instance, the annotations in Lowell's own hand of the volumes which he presented to the Harvard Library; and he prints for the first time Emerson's verses read on Lowell's fortieth birthday—a most penetrating and characteristic sketch. From all this embarrassing pile of riches he has extracted what is essential and characteristic with the most delicate skill and judgment. The juice and marrow of Lowell's life and work and character are here decanted into a little volume of 300 pages. In condensing, moreover, the lineaments of life have been neither distorted nor obliterated. On the contrary, even compared with Mr. Scudder's excellent and intimate biography, framed upon a much wider and more leisurely scale, it must be admitted that this little volume is thoroughly alive, and as far as possible from a *hortus siccus*.

Within its limits no one need attempt to revise or improve on it. It will remain, we believe, a definitive and final biography. The reviewer may, if he choose, feel that legitimate resentment which is natural toward the man who has said our say before us, anticipating all our judgments and "conveying" the apposite quotations he may have marked for his own. Or he may feel a reasonable complacency that his conclusions for years are here neatly and perfectly expressed, and his surmises confirmed, by one who must in future be reckoned an authority in his craft. For it is hardly possible to speak too highly of Mr. Greenslet's performance. In addition to an unusually ample literary outfit, he possesses the critic's instinct and insight, and his almost unfailing touchstone.

In glancing over the record of Lowell's life, we are struck by the great variety of his activity, and by the weight and quality of his achievement. It is an extraordinary distinction that a critic and man of letters, who may be compared with some great names in England or France—a poet, also, of genuine gifts—should have lived so close to his fellow-men and to the great currents of the world as to make an ambassador at once brilliant, serviceable, and discreet. In spite of his bookishness, in spite of being tied to a professor's chair for many years, he remained, to use his own phrase, a "real man." "Fine as is his written work," said Mr. Watts-Dunton, "his unwritten work is finer still." Mr. Greenslet appraises with his usual justness and accuracy the value of Lowell's services as a professor. "He was never quite a scholar in the German sense, nor even in the modern academic sense." In spite of multifarious reading and learning, and partly because of his reliance on a facile memory, he was capable here and there of little slips. In his "Shakespeare Once More" he alludes to Orestes's nurse in the "Agamemnon"—an ancient Gamp who belongs solely to the "Choephorœ"; and he does this immediately after a full profession of faith in the standards of the classics. Mr. Greenslet points out also a little nest of errors and inadvertences contained in a footnote to the essay on Spenser. But even such peccadilloes are certainly not characteristic of the learned reviewer of 'The Library of Old Authors'; they are exactly the kind of unpardonable crimes which it is now the first business of the critic or the philologist to hunt down and detect, and which are sufficient to damn an otherwise meritorious piece of work.

Genius is scarcer than scholarship, and the English were quite right when they coveted Lowell for a professorship of English literature at Oxford. A university does well occasionally to catch and cage a genius, who may never be fully broken and harnessed to the work of a plough-horse; for genius fertilizes by contagion, and the best of a student's work is that which he is inspired to do himself. And Lowell certainly impressed the imagination. If you met him in the class-room, you submitted to the charm and *bonhomie* of a manner without pose or affectation, without a trace of the pedant or the pedagogue; if you listened to his lectures, you followed the fascination of their brilliant flights, but had not the heart to stenograph them in cold blood; if you met him on horseback in the street, you were sure that the steed he rode was named Pegasus. In an atmosphere indigo-colored with blue laws, there was a sense of emancipation in sitting under a professor who refused to appraise over-nicely the omnipresent examination paper, and had no "realizing sense" of the impropriety of wearing on Sunday a coat which was not "black, with buttons of the same color." One felt the same thrill when Agassiz violated the laws of the universe by visibly smoking a cigar in the college yard. Lowell never took kindly to the professor's gown; in his letters he frequently fumes and recalcitrates against it, and misdoubts his vocation to the garb. Yet the poet and the man of letters stirred young imaginations and opened wide horizons; for, of all people, young men are the last to live by bread alone.

Two features come out strikingly from the confessional of Lowell's letters—his constant aspirations and yearning for poetic fame, and the constant recurrence of a sense that he is a poet *manqué*. He is always just about to satisfy his own standards, and he never really does. In his youth he could say, "If I have any vocation, it is for verse; if I prose, it is *invita Minerva*." But in later life, even after writing his Commemoration Ode, there is a frequent strain of disappointment: "Like a boy I mistook my excitement for inspiration—I am ashamed of having been tempted into thinking I could write poetry." Lowell was, in the main, an excellent critic—he was sometimes a careful critic of himself, as we may see in his interesting remarks in the Commemoration Ode and in the variants which he furnished, with many wavering codicils, to the little poem entitled "Phœbe." It is wise, then, to listen respectfully to the opinion of such an expert, or even to his instinctive self-distrust; it is possible that these may coincide, measurably, with the judgment of posterity. That he had a highly sensitive and poetic temperament goes without saying. In the fresh days of his youth he confesses "the balancing of a yellow butterfly over a thistle-blossom was spiritual food and longing for a whole forenoon." What is the reason, then, of the failure of this Wordsworthian to reach his ambitions? There are always ingenious explanations which satisfy his own mind—the distractions of his editorial duties, his professor's gown, "which estranges the Muse," or the want of a continuous "diet of hee-bread." The poet, he thinks, should be fed exclusively on poetry; the Muse hears no rival. This is partly true. Keats and Shelley and Tenny-

son were poets, and nothing but poets; they never laid aside their singing-robes. Yet Goethe remained a poet while feeding his mind on many other things besides poetry. Diet will not change a lark or a nightingale into an eagle. No surfeit of nectar and ambrosia would have transformed Gray into a Milton, nor Longfellow into a Shelley. In the firmament of the poets the distinction between satellites and suns is very marked and constant; there is no interchange between the different orders and magnitudes. Mr. Matthew Arnold complained, as Lowell did, that the distractions of his life kept him out of his due heritage with the immortals; and he had much more reason than Lowell—he was an overloaded man, shamefully burdened with the daily drudgery of his examination papers. If he had been freed from this treadmill, he would have written more poems; yet the poems would have been of much the same quality.

Unlike Arnold, whose small and carefully sifted volumes reveal some veins of pure gold, Lowell obscured his gift by permitting himself to print a considerable bulk of verse which has little or no title to the name of poetry. He improvised with a rush, and he published unhesitatingly his improvisation. Hence he is his own chief detractor. Some unquestionable poets have been Rhadamanthine in their self-judgment: Gray, for example, and Tennyson, rejected ruthlessly and fastidiously many gem-like stanzas which did not fit exactly in their place. Lowell did not practise this kind of self-denial; and so the torrent of his fluent verse inundates and almost drowns the dearest object of his ambition. As a matter of self-preservation, he required an anthology. The half (perhaps the third) of what he printed is far better than the whole; and this Mr. Greenslet quite truthfully observes. We should agree, in the main, with the selection which he proposes. Some shorter pieces, such as "Invita Minerva," "Phœbe," and "Turner's Old Téméraire," are the spontaneous offspring of a single mood or idea, and they create felicitously a kindred mood in the reader. They are of one piece, and produce a net impression; they waken an echo in the mind or heart as the music of a song might, or the stroke of a distant bell. The language, too, and the rhythm are as pure and harmonious as the conception. The same thing may be said with some reserves for the "Vision of Sir Launfal," which Mr. Greenslet dissects very prettily and instructively. These are the pieces which we may call Attic, and to which it would be churlish and unreasonable to refuse the name of poetry. They are free from Lowell's foibles, his facile imperfections, his intrusive learning, his over-moralizing, his freakishness, his tendency to dart hither and thither after the will-o'-wisp of his fancy or humor.

As to the Odes, we confess ourselves more dubious, and perhaps heretical. Lowell loved to soar in the ode, and he affected especially that artificial form of it which is remotely Pindaresque. He gives reasons sufficient to his own mind why, if an ode is to be recited, this form should be preferred. In any shape, however, the epideictic ode is a perilous venture. It requires a very high and sustained temperature of the fine frenzy to fuse and inspire it with the poetic glow, to purge it from the dross and slag of learned allusion or prosaic expressions and reminiscence. A very few—Milton, Gray, Shelley, and their select company—reach this fiery ether. They bear us entranced and intoxicated upon a wing so strong and steady that it leaves no fear of falling to the hard, prosaic earth. The remainder provoke trying and invidious comparisons. In the Commemoration Ode, Lowell wrote under the tension of strong feeling for a personal bereavement, he wrote with an afflatus which "left him lean"; yet we believe that certain stanzas might be turned without loss into impassioned prose. On the other hand, the "Biglow Paper" (No. X.) which covers in part the same ground, contains to our mind more genuine poetry; it expresses more simply and poignantly the stress of emotion which charged the atmosphere of that period; compared with this natural and affecting utterance, is it hypercriticism to say that the Ode seems somewhat artificial and academic?

The 'Biglow Papers,' indeed, though Lowell himself would have been loath to own it, were by far the most important asset which he left in verse. In them, he had plenty of elbow-room, and he expressed with freedom and naturalness almost every side of himself. Hosea Biglow was a delicious invention, and, behind his mask, spoke all that was strongest in the endowment of his creator—humor, eloquence, mother-wit, and shrewd sense, the *sæva indignatio*—all the elements of powerful satire, and, when the mood fitted, a strain of genuine pathos or poetry. Hosea's lingo, too, had a tang and piquancy which those who knew it as vernacular could savor most. It was said that Lowell himself dropped into it in moments of abandon. The Papers were, in their way, a felicitous and unique *trouvaille;* nothing more distinctively American was ever written. Add to all this their downright effectiveness, for they condensed and reinforced the highest sentiment and conscience of the time, and became a heavy battery on the side of freedom and public morals. That they are political and expressed in a lingo, dooms them, of course, to eventual decay. They require a glossary and an historical commentary, even now, and must retire sometime to the shelf of the student; but, notwithstanding the fatigue of a vanishing dialect, their humor will long give them salt and savor; their quotable sayings have become proverbs which still "flit upon the lips of men," and will continually lead back readers to the mine from which such brilliants emerged.

TWO STATE HISTORIES.

Rhode Island: A Study in Separatism. By Irving Berdine Richman. (American Commonwealths.) Boston: Houghton, Mifflin & Co. 1905. Pp. xii., 395.

Louisiana: A Record of Expansion. By Albert Phelps. (American Commonwealths.) Same publishers. 1905. Pp. x., 412.

To write a satisfactory history of an American commonwealth is not, one may suppose, in respect to most of them at least, a task easily performed. In too many cases the particular commonwealth is little more than a geographical expression, and its history is, like its physiography, an indistinguishable part of the history of the whole country, or at best of a large section of it. Commonly, therefore, the author is presented at the outset with the unpalatable alternative of telling a purely local story which is not for the most part of any general importance, or of sketching the history of the nation, with an occasional aside to remind the reader that the commonwealth in question made a part of it. In the former case there are few States which, like the English county, present conditions that enable the author to find consolation in antiquarian research, and none whose story centres in an ancient town with a century or more of vital historic life lying embedded somewhere in the Middle Age. If, on the other hand, the alternative appears to present a comparatively easy solution for the author, the editors are in danger of offering to the public a series in which the duplication is excessive.

The two volumes named above, almost simultaneously issued from the press, may be profitably considered together, inasmuch as they present, each with certain modifications, the opposite methods of meeting the dilemma just now suggested. They are, it may be added, peculiarly adapted to such a consideration, because two more attractive subjects than Rhode Island and Louisiana could not well be found in the whole range of commonwealths, or two that are wider asunder in origin and character. Each had more than a century of life before entering the Union; one finds its origin in Latin Catholic civilization, the other in English Protestant civilization.

Of these two methods Mr. Richman has adopted the first. He has told the story of Rhode Island with the briefest possible excursions into the larger field of national or international affairs. That he has taken this course is doubtless due to the fact that for him Rhode Island embodies a certain principle, the elucidation of which should furnish a unity that would be lacking in the case of another State. What that principle is, is well known to those who are familiar with his previous work on the early history of Rhode Island; and how he has sought to project it into the later period will be clear from the summary which closes the present work:

"The history of Rhode Island has been sketched in three parts: the part Agriculture and Separatism embracing the period 1636 to 1689; the part Commerce and Co-operation embracing the period 1690 to 1763; and the part Unification and Manufactures embracing the period 1764 to the present day. The last two parts are important as indicating the course of industrial development, and as revealing separatism in its deep power of survival. But it is the first part that is most important. It comprehends the time when Rhode Island alone among commonwealths exemplified the two leading ideas of Christianity and the Reformation—the two leading ideas of modern life and progress; the idea of Soul Liberty or Freedom of Conscience in religion; and the idea of the Rights of Man in politics" (p. 342).

To this most important part, Mr. Richman, nevertheless, gives but 65 pages out of a total of 345. His own justification for this course is the fact that he has already treated the early period somewhat elaborately in a work that appeared a few years since, and "it is largely the object of the present work," he tells us, "to point out the influence of separatism in determining the course of events . . . during the

eighteenth and nineteenth centuries." One may suggest, however, that the present volume is intended to appeal to another class of readers than the earlier work on Rhode Island origins; and the reviewer, at least, can hardly resist the conclusion that nothing would have been lost had the later period been shortened to permit of a more extended account of the time when Rhode Island "exemplified the two leading ideas of modern life and progress." Certain it is that the influence of "separatism in determining the course of events during the eighteenth and nineteenth centuries" hardly suffices to secure that unity of narrative which is highly desirable in a book addressed to the general public. Further, one frequently feels that the author's general theory is being put to a severe strain, as, for example, where separatism is made responsible for "the politics of the State, both legitimate and debased" (p. 312). For present-day citizens of the State, the idea will doubtless have something of consolation in it, to say the least. But if the general theory is sometimes a little hard pressed, it nevertheless serves to furnish us with a suggestive treatment of many phases of later Rhode Island history.

In his brief sketch of the "Age of Roger Williams" Mr. Richman again emphasizes the proposition that was fundamental in his 'Rhode Island: Its Making and its Meaning,' namely, that Rhode Island, in the seventeenth century, stood for individualism (p. 61). That is well enough, but when it is added, in explanation of individualism, "rights of man as a being responsible primarily to God and not to the community," one is conscious of a certain confusion of thought. If by "individualism" is meant merely a certain extension of the sphere of individual freedom from State control, it is true that modern civilization is characterized by individualism; but in that case the difference between modern civilization and mediæval civilization—if the latter is what Mr. Richman has in mind—is a difference in degree rather than in principle. But if by individualism is meant the abstract principle, then it is not true that modern civilization rests upon individualism; for individualism in this sense means anarchy. The modern State suppresses with a ruthless hand whatever individual action it considers harmful to the State. That the modern State is not endangered by the same amount of individual freedom that would have endangered the Massachusetts theocracy, does not change the principle upon which they both rested. Nor can it be said that modern civilization accepts the idea that man is a being "responsible primarily to God and not to the community." Indeed, if there is one conception that is just now winning its way, we should say that it is precisely the principle that the individual will must be subordinated to the will of the community.

Mr. Phelps, adopting, as we have said, the opposite method, has resolutely seized upon the period previous to the admission of Louisiana into the Union as the important one, and even here he has excluded local history save in so far as it made a part of the general history of the Southwest. More than one-half of the book is given to this period. Here is retold—admirably, indeed—the familiar story of early exploration and settlement, Mississippi Bubble, Spanish control and reorganization, international intrigue, recession and Burr conspiracy. Much of this has already been told in other numbers of the series, much of it will doubtless be told again in future numbers. The remainder of the book is executed on the same plan. From 1815 to 1860 one loses sight of Louisiana almost entirely in the interesting discussion of the political and economic troubles leading to secession, while the three concluding chapters constitute essentially a commentary on the Civil War and Reconstruction from the Southern point of view.

The result is a narrative exhibiting unity and coherence, and dealing with large events in a large way. Partly because of a fortunate subject, partly because of a method to which the subject lends itself admirably, partly because of a first-hand familiarity with his material, Mr. Phelps has given us one of the best of the Commonwealths histories. While the later period is touched upon suggestively, if not with satisfactory detachment, it is the treatment of the earlier period that gives value to the book. The account of the history of Louisiana down to 1731, and of the Spanish reorganization and control, is excellent. On the subject of international intrigue between 1789 and 1800, Mr. Phelps is well informed, and if the story at this point is not altogether clear, the reader should remember that the period presents an exceedingly complex series of events to disentangle. If the constitutional importance of the debates centring about the treaty of 1803 is not set forth as satisfactorily as might have been expected in view of the exhaustive treatment of that question by Henry Adams, there is a certain recompense in the admirable description of conditions in the Territory which Mr. Phelps has given us in this connection. In dealing with the alleged Burr conspiracy, the author has followed, with some needed caution, the excellent work of Mr. McCaleb. With slavery Mr. Phelps has, necessarily, much to do. He has discussed it from what is commonly known as the Southern point of view. That slavery, from the earliest period, was an economic necessity; that slave legislation, originating in the *Code Noir*, was essentially humane; that the evils of slavery were greater for the white race than for the black; that these evils lay in the danger to "racial integrity"; that the South perceived this danger and was more interested in preserving racial integrity than in perpetuating slavery; that there was, after the war, no "negro" problem not made by the discontented mulatto and the white politician which the "white man unbampered and the negro uninfluenced" could not easily have settled—these, we take it, are the main points of Mr. Phelps's discussion. These statements invite comment, but space is wanting.

SUNDRY NOVELS.

A Renegade, and Other Tales. By Martha Wolfenstein. Philadelphia: Jewish Publication Society of America.

The Bride of a Day. By R. B. and Dorothea Townsbend. London: George Allen.

The Purple Land. By W. H. Hudson. Dutton.

The Sage-Brush Parson. By A. B. Ward. Boston: Little, Brown & Co.

Vrouw Grobelaar and her Leading Cases. By Perceval Gibbon. McClure, Phillips & Co.

On the Field of Glory. By Henryk Sienkiewicz. Translated from the Polish original by Jeremiah Curtin. Little, Brown & Co.

'A Renegade' presents to us a number of Gentile sinners and Jewish saints in the setting of far-away Bohemia. The scene and the subject are beyond the first-hand criticism of most readers, but a comparison with Zangwill's stories makes us wonder whether Martha Wolfenstein does not see the Gass in rather too roseate a light. However, we need not quarrel with the characterization if the stories were only interesting; but they are not. They are of the disappointing kind that begins with spirit and ends tamely, often concluding with a piece of forced pathos that produces actual irritation. The one simple love story, "Dovid and Resel," is the best of a poor bunch.

'The Bride of a Day' introduces us to New Mexico in the fifties, and is a readable story of romance and adventure. The element of love is supplied by the marriage of a Cornish gold-digger with a captive Navajo girl, a marriage primarily suggested by him in order to prevent her compulsory return to the reservation of her tribesmen. The adventure consists in the efforts made by the tribesmen to get and retain possession of her, though it needs no prophet to see from the beginning that their savage cunning will be finally foiled. In style, plot, and character the book is on a respectable level of commonplace.

Mr. Hudson's 'The Purple Land' is primarily a book of natural history. Even if we did not know of the author's other works, 'The Naturalist in La Plata,' 'Birds and Man,' etc., all later in date than the original edition of the volume now before us, we should quickly realize that the chief interests of this would-be novelist lie in the wild flowers and birds of the Uruguay which he describes. The story is constructed out of a series of scenes at different estancias in the course of the hero's journey in search of work. There is in every house a woman, generally a fascinating one, but the writer would have us know that his marked preoccupation with pretty women is only a part of his "great love for the beautiful: sunsets, wild flowers, especially verbenas, and beyond everything the rainbow." This strange concatenation is typical of the whole book, where travels, native stories, flirtations, a revolution, a prisoner's escape, a girl's flight from an unwelcome lover, are all strung so loosely together that sustained interest is impossible. The real point of the volume seems to be in the concluding paragraph of the last chapter but one: "Farewell, beautiful land of sunshine and storm, of virtue, and of crime; . . . may the blight of our superior civilization never fall on your wild flowers or the yoke of our progress be laid on your herdsmen." This sentiment reminds us forcibly of school debating societies, where the superiority of Barbarism over Civilization is apt to be carried by a large majority. But it is sweet, even if somewhat cloying, to read a lover's rhapsodies, and this ardent outpouring of devotion for the Banda Oriental will give pleasure to all unskeptical readers.

It is hard to determine whether the real hero of 'The Sage-Brush Parson' is the parson himself or Jack Perry, the devoted if somewhat blasphemously inclined saloon-keeper. But from the time Clement Vaughan, in his long, clerical coat and Nevada sombrero—a concession to the new country of his adoption—steps from the train into an enveloping cloud of alkali dust, his fortunes and adventures hold one's unflagging interest. A. B. Ward, the non-committal name upon the title-page, might be the person relating his own experiences, or a participant in the scenes depicted, so vivid are the descriptions, so intimate the apparent knowledge of life in a rough mining community, where all is sharply accentuated, and softening gradations of color are not needed in painting social combinations. Three or four tales of equal length, made up with the usual proportions of padding, might have been evolved from the material used in this story so lavishly. Every sentence tells, every chapter is a necessary step toward the consummation, every scene has its inevitable place in that unfolding of motive and character which abounds in the narrative almost as much as constant action. From the arrival of the parson at Eureka, the scene of his devoted attempts at uplifting the heterogeneous inhabitants, until he disappears into the desert in the final chapter, there to regain himself and his poise, the current of the story moves too swiftly to allow of laying the book down until completed. "Gathering a Congregation" and "Charley Davenport's Funeral" must actually have occurred, in some form, somewhere; and hardly less real are "Fairy Fingers," "The Debate," and "Sobering-Off a District Attorney." Katharine Chisholm furnishes the offsetting grace, the refinements of gentle living, in this rough community, and in the beautiful home on Richmond Hill the young preacher finds rest and inspiration. But the touches of humor continually cropping out are still more invigorating to the reader, even casting a relieving gleam upon the sombre chapters relating to the trial, the death-watch, and the reprieve. The style is crisp, virile, incisive; and although there may be suggestions of Bret Harte, perhaps even of 'The Virginian' here and there, this is yet a new story, strongly told, with a character all its own.

In 'Vrouw Grobelaar' lies waiting a genuine sensation for the lover of short stories. Unless the reviewer is at fault, they will recall to the reader the hour wherein he tasted his first Maupassant, and that other hour when the new Kipling swam into his ken. In the Boer Country of Africa there is a field rich in material. If more barbarous material than that of France and more limited than that of India, it still comprises its own folk-lore, its own animal-lore and legend, the savagery of primitive tribes, the tragedies of clashing civilization and barbarism, and, most characteristically of all, the creepy transition from the beast to the human. We have been made familiar with Africa's animal traditions of late, and have perhaps found them more interesting and instructive than entertaining. Stories of African pioneering, agriculture, and war have been freely granted us—good stories, too. But Mr. Gibbon has suddenly developed the African *conte*, masterly in form, in manner, in outcome. There are episodes of great beauty, climaxes of great skill, moments of great horror, but rarely an inartistic moment, never a tedious one.

Vrouw Grobelaar, who tells the stories, has a diction of surprising variety for a woman who could neither read nor write. If blemishes in the book are to be hunted for, here is perhaps one—that the excellent Vrouw at times speaks Stevensonian, and anon practises Hewlettry. Possibly nothing less would have conveyed the full aroma of "her leading cases." The story never suffers; the Vrouw does, a little, as a portrait, yet very little, since her personality is strong, and rises distinct and self-asserting to where beyond these voices of preciosity there is peace, the peace of consistency. "The muscle-rippled skin of him" does not undo the real Vrouw as disclosed in her maxim that "Garlic is a thing you must not play with; like sin, you can never undo it, whatever forgiveness you win"; or her discovery that "when a man meets a rebuff with silence and dignity, he is aging." The Vrouw is a creation. She suggests, possibly, not a person so much as the solidified experience of her world unspotted by knowledge of any other. Marvellous are the stories she tells. The little Katje who hears and flouts them flutters like a red poppy through the pages. She and the Vrouw's weird quips furnish the needed pin-points of light in the prevailing sternness, even awesomeness, of the stories. They make the blood curdle, but it is a legitimate curdle, accompanied by assent and admiration.

Whoever has read and liked Sienkiewicz's trilogy of historical romance is advised to read 'On the Field of Glory.' There is the family likeness of authorship, and there is even an actual echo of the names made familiar in those books. It may also attract new readers to know that this is not a novel of battles, but of the unsettled times preceding the second great siege of Vienna by the Turks. There is the more leisure, therefore, for love-making and home-scenes; there is the author's witty sympathy—his characteristic note—and there are militarism and ferocities enough, Mars knows, to boot. The story treats chiefly of the adventures of certain doughty knights, nobles, and clericals who rescue a fair damsel from perils of the wolf and the wicked human monster, and, having rescued, deliver her over safely to her own true love. Trite as this outline appears, there is nothing trite in the experiences of the pretty Anulka and her devoted friends, of whom one of the foremost is Father Voynoski. A mighty warrior in his day, the comrade of Pan Michael of glorious fame, he has now, after many hard fights and bitter sorrows, turned priest. He believes that war is abhorrent to Heaven—except a war against Turks; for in such case, reasons he, "God put the Polish people on horseback, and turned their breasts eastward; by that same act He showed them His will and their calling." Next in zeal for the beleaguered Anulka and for all Christian conflict come the four brothers, Bukoyemski, of whom the priest truly says, "The Bukoyemskis are the Bukoyemskis." Named for the Evangelists, Mateush, Marek, Lukash, Yan, they go galloping through the romance in brotherly love and brotherly squabbles, drinking, blubbering, slashing, slaying, praying, clowns of speech, thunderbolts of action. They make themselves derided, feared, and in the end well-liked by their fellow-countrymen, whom the reader follows—at an Anglo-Saxon distance. They are as stirring in their way as the author's immortal Zagloba was in his. Anulka is as charming as Sienkiewicz alone (one is tempted to say) can make the heroine of gory romance. There is a good flash-light portrait of her in the lines, "The whole house was filled with her, and wherever she showed her little confident nose and her young gladsome eyes, delight and smiles followed." The closing scene is a panorama of gorgeous color, when King John Sobieski marshals his troops before his queen, as they are about to move on to Vienna. The pages palpitate with the color, glitter and swing of the great army. The climax is reached when the hussars march by in their steel armor, inlaid with gold, on their shoulders wings, "in which the feathers, even when moving slowly, made that sound heard in forests among the branches." Anulka cries farewell to her newly-wedded husband as he turns his iron-covered head toward her. Gladly would she have changed to a swallow to perch on his shoulder or the flag of his lance, and go with him to the Field of Glory. "She would not have stopped for one twinkle to calculate."

The translation is made with Mr. Curtin's accustomed brilliancy, flecked by an occasional blur like "shady eyelashes," "to milden the pain"—more expressive than idiomatic.

A FLASHLIGHT NATURALIST.

With Flash-Light and Rifle: Photographing by Flash-Light at Night the Wild Animal World of Equatorial Africa. By C. C. Schillings. Translated and abridged by Henry Zick, Ph.D. Harper & Brothers. Pp. xiv., 421. 1905.

Flashlights in the Jungle: A Record of Hunting Adventures and of Studies in Wild Life in Equatorial East Africa. By C. C. Schillings. Translated by Frederic Whyte, with an introduction by Sir H. H. Johnston, G.C.M.G., K.C.B. Illustrated with 302 of the Author's "untouched" photographs taken by day and night. Doubleday, Page & Co. Pp. xxxii., 782, 1906.

Wonderful tales of adventure are not uncommon in the literature pertaining to explorations and exploits in the Dark Continent, and hair-breadth escapes from the very jaws of death are not only pictured in words, but frequently rendered all the more vivid by illustrations. Not a few of those who thus relate their tales of adventure, their lion hunts, their elephant hunts, their tiger hunts, etc., have never seen these animals alive except when safely caged in a passing show or in a zoölogical garden. Now that the camera has come into general use, we usually find half-tones after pictures taken on the spot just at the critical moment, and the unsophisticated public assumes that the camera tells no lie. A careful examination of such pictures usually reveals the fact that a poorly stuffed specimen has been forced to serve the purpose of the ambitious journalist. It is

therefore a decided pleasure to find a graphic account by an explorer and enthusiastic collector, whose persistent efforts have made it possible for him, not only to give a narration of his travels and the wealth of large game met, but also to give to the public the finest series of reproductions of photographs from life of the various animals encountered which have ever been reproduced. Herr Schillings states that he felt the insufficiency of words to depict convincingly the conditions of animal life in Africa as he found them on his first trip, and the need of some mode of representation that would be incontrovertible. Naturally, the camera appealed to him as the one means with which to accomplish this end. After careful experimenting with telephotography and flashlight, he set out for his second expedition. The results of this trip did not altogether satisfy him. A new series of experiments were made on his return, in which not only Capt. Kiesling, an expert military photographer in the German army, but even Mr. Goerz of the Goerz Optical Company, lent a hand. This resulted in the third expedition, and the author tells us he again learned "that theory and practice are two different things." After many disappointments and suffering from an acute heart trouble and malaria, he was compelled to give up the expedition and seek recovery in his native land.

Undaunted by these adverse experiences, he set out for a fourth expedition into German East Africa. The caravan, consisting of the author and (part of the time) Prince Loewenstein and one hundred and seventy native carriers and guards, left Tanga by rail for Korrogwe early in February, 1903, travelling from there on foot by way of Mombo and Masinde toward Mt. Kilimanjaro. The regular caravan route was avoided, the expedition following the Rufu River. In addition to the general account of the journey, the physiography of the land, its people, animals, and vegetation, there are separate chapters devoted to the habits, hunting, and photographing of the noble game of the region. In his chapter, "The Tragedy in the Path of Progress and Civilization," the author points out that the native fauna in Africa is doomed to speedy destruction, even as the buffalo, which once roamed over our Western plains, has passed away to make room for the settler. However, Africa is less hospitable to the European invader, for the tsetse fly soon inoculates his stock with the deadly trypanosome, leaving the settler to till the soil without these necessary aids to agriculture. It is interesting to note what is said regarding the domestication of the zebra. This beautiful "tiger horse" appears to be immune to the dread nagana, and experiments are being carried on in Europe as well as in Africa to domesticate it, so that man may overcome the barriers to civilization placed so effectually by the tsetse fly. The author does not place much hope in these experiments, but states that "the zebra may be made to pull a wagon or carriage when hitched together with ponies, but this is mostly play, and not work; it does not and will not exert its full strength, and will not labor until exhausted as our own horses do." He suggests that it would be much more reasonable and promising to train the native ass for hard work. Aside from these opinions he gives an interesting account of the animal in its native habitat, illustrated with three very striking flashlight pictures, taken at drinking-places. There are seven other plates which show zebras in various poses and under divers conditions.

Thirty-five pages and four plates are devoted to the African elephant. Two chapters deal with the rhinoceros, which is probably the most dangerous animal to hunt in Africa. Many narrow escapes are recounted, and it would almost seem as if enough specimens had been slain to supply the needs of all existing museums. The difficulties of capturing, nursing and transporting a young rhinoceros, are well described. Other chapters deal with the hippopotamus, giraffes, gnus, hyenas, jackals, leopards, baboons, and monkeys, and the diverse species of gazelles, water-bucks, antelopes, and buffaloes, as well as the larger birds of the region. Most interesting are the author's experiences with the lion, which might win him the title of lion-killer, were it not for the fact that he has brought even greater fame upon himself as a lion-photographer. No less than thirteen plates are devoted to the king of beasts; ten of these are flashlight pictures of the wild animal in its native surroundings—clear and sharp, which could not be excelled for detail if they had been made in a specially-constructed cage in some zoölogical garden. Some of these represent the animal in the act of attacking the bait, while others show the lion or lions at the drinking-place. One plate depicts no less than three flashed while peacefully drinking at the brook.

As to their production, we will let the author speak for himself:

"My method of procedure was simple enough, but dangerous. Towards evening I would bind some animal—as a rule an ass—to a tree near the path of the beasts. The animals used as bait are not exposed to any suffering, for the lion kills his prey quickly with one bite in the neck. Taking my stand nearby, and placing the apparatus in position, I waited until I heard and saw the beast approach its prey. It goes without saying that I had to register more failures than successes. These days and nights were full of anxiety, suspense and also disappointments for me. But when I did finally accomplish my purpose—when I caught the king of animals, the mightiest beast of prey, in the act, as it were, and held the documentary evidence on the small sensitive plate—my joy was simply without bounds. Even my stoic blacks became excited and discussed this memorable event for many days."

The other method employed by Herr Schillings was to conceal himself at some frequented water-place in the evening, and lie patiently in wait until the desired object came within the range of the flashlight and lens.

There are one hundred and twenty-one illustrations in the Harper edition mentioned at the head of this article, some of the most striking of which are: "Thomson's gazelles by flashlight," "Male and female rhinoceros bathing," "Zebras scenting a lion," "Three old lionesses at the brook," "Male leopard at the drinking-place," "Gnus approaching the camera through curiosity," "Zebras, white-bearded gnus and impallah antelopes herding together," "Impallah antelopes at the brook," "An old lion in a swamp," the last a veritable masterpiece. The only adverse criticism which we have to offer is that the printer should have bestowed a little more care in the reproduction of the plates, and some one should have noticed that the cut on page forty-six, was upside down.

The delayed edition of Messrs. Doubleday, Page & Co. is an unabridged translation, containing 379 pages and 181 illustrations more than the Harpers'. The appendices, labelled "Volume II.," will be hailed with pleasure by mammalogists and ornithologists, since they give a definite account of the collections which Herr Schillings has brought from Africa. The first of these deals with the mammals, and was prepared by Prof. Paul Matschie, Curator of the Royal Zoölogical Museum of Berlin, who says: "We need only glance at the complete list of the mammals brought home by Schillings, to realize the importance of his collection. He has collected a greater number of different species than any other traveller before him. He has secured three-fourths of the various species which were to be looked for in the districts through which he travelled." These collections have not only aided greatly in understanding the problems of mammalian distribution in East Africa, but have added a number of entirely new forms to that fauna, among them Schillings's giraffe (*Giraffa schillingsi*), Schillings's hyæna (*Hyæna schillingsi*), Schillings's klipspringer (*Oreotragus schillingsi*), and others which await naming. The list embraces 115 species. Appendix B is "A Synopsis of Herr C. C. Schillings's Collection of Birds," compiled by Prof. A. Reichenow. This list is based upon more than a thousand skins belonging to 355 species, of which five are new to science. The list is fully annotated with interesting and useful notes on the habits, distribution, nidification, etc., of the various species by Herr Schillings. The letterpress and the plate printing have been beautifully executed.

FINCK'S GRIEG.

Edvard Grieg. By H. T. Finck. John Lane Co. 1906.

Mr. Finck says truly in his preface that no apology is needed for the appearance of this volume. "The number of Grieg's admirers is legion, yet up to the present time there has been no book in English (or even in German) to which they could go for information regarding his life, his personality, and his works." Even if there had been, there is probably no biographer for Grieg who as amply as this one combines extreme enthusiasm, intimate knowledge of the extent and content of Grieg's creations, the advantage of personal acquaintance with the man, and a style as pellucid as an old ballad and as crisp as a Bach gavotte.

The story of Grieg's life is not one of darkest storm and stress. An invalid, he has lived in seclusion in the Far North; a successful pianist, conductor, and composer almost from the beginning of his career, happily married to a cousin who could not only inspire but interpret his songs—in spite of some dark years and some inevitable shadows, he stands for us in the sun; largely as to his career, wholly and radiantly as to his warm personality. The photographs of him, from the fifteen-year-old boy to the sixty-year-old man, receiving birthday congratulations at his own

door, are full of charm and of a winning quality that fit absolutely into the character of his music. It is interesting to know that Grieg's great-grandfather was an Alexander Greig of Scotland, who, like many of his countrymen, emigrated to Norway in the troublous days succeeding Culloden. Though he changed the spelling of his name to insure its proper pronunciation, he did not wholly change his mind with his skies. So firm was his attachment to the Scotch Reformed Church that once a year he returned to Scotland to partake of the communion. By the time Edvard Grieg was born, however, in 1843, the Scotch strain was well-nigh lost in the Norwegian. Of his fondness for the "drone bass," which is characteristic of all Northern music, Mr. Finck says: "Possibly Grieg's love of it was stimulated also by atavistic reminiscences of his Scotch antecedents."

Grieg inherited from his mother his musical talent, and she was his first teacher, supplying, besides the actual instruction, a musical atmosphere by her own playing and singing, and by gathering about her zealous amateurs whose weekly reunions made happy hours for the small Edvard. It was Ole Bull who, on hearing the boy's compositions, counselled the parents to send him to Leipzig. Mendelssohn was dead and Schumann had gone to Dresden, but there were still at the Conservatory Moscheles, Reinecke, and other famous teachers. Among the students was Arthur Sullivan, in connection with whom Grieg gives a pretty reminiscence of an hour when the two sat and followed a performance of "St. Paul" with a score—Mendelssohn's own manuscript borrowed by Sullivan from the Director of the Conservatory. This foreshadows one of the great charms of the book—the touching of Grieg's life upon those of many interesting men. We find him playing duos and making mountain excursions with Ole Bull; both loving Mozart; Grieg leaning to modern heresies, the elder man saying of Wagner, "He ought to be lodged in prison." We see Grieg submitting his compositions to Gade; we are half-deafened when Björnson breaks wildly through the door upon Grieg giving a music lesson, to cry out that he has thought of the right word for a refrain in the verse he is fitting to Grieg's music. Here is Liszt sending a word of unsolicited praise to the twenty-five-year-old composer, and then follows a delightful account from Grieg's own hand of his visit to Liszt in Rome, of his qualms, his golden hour, the second meeting and the "divine episode" of Liszt's almost dramatic enthusiasm, and his parting admonition to Grieg "not to let himself be intimidated"—words which had for the young composer "an air of sanctification," carrying the promise of "a wonderful power to uphold him in days of adversity." A few years later came the letter from Ibsen to Grieg which resulted in the "Peer Gynt" music for Ibsen's play. For others among the many shining names linked with Grieg's we may go to Cambridge in 1893 and witness the conferring of the degree of Mus. Doc. on him, on Tchaikovsky, Saint-Saëns, Bruch, and Boïto—a stirring occasion, truly, with Grieg alone absent.

Very interesting are the descriptions of the London visits of 1888 and 1889, when Grieg was so popular as composer and pianist that people waited before the doors from eleven in the morning "quite as in the old Rubinstein days," and when, at a Philharmonic concert, "the hero of the evening was Mr. Grieg, the heroine being Mr. Grieg's wife," she singing his songs to his accompaniment. Mrs. Grieg's singing by all accounts must have been singularly appealing, warm, and beautiful. Criticism would have been easy, but none remembered to criticise. They seemed to think (or rather feel) only with the singer. They likened her to Jenny Lind. Tchaikovsky's tears came on listening to the Griegs; Ibsen seized the hands of both after listening to their interpretation of some of his own poems as set to music by Grieg, and whispered "Understood." (There seems to be a portrait of Ibsen as well as of the Griegs in this story.) Another particularly taking chapter is that which records the visit paid to Grieg on his own Northern soil by the author and his wife, who writes a picturesque account of it in an informal letter.

These are but glimpses into a delightful little biography. It will interest lovers of Grieg's music, of all music, of artist tales, of lively musial comment, criticism, and anecdote. The particularly affectionate itinerary through the land of the songs ought to be helpful to amateurs, and perhaps will stir up the hearts of the professionals when they are making their programmes. Considered as a composer, Grieg's fascination, variety, and inventiveness, the beauty of his melodies, the originality of his harmonies, his ingenuity in the development of Norse music, are conceded by all. Opinions differ as to the exact boundaries of his originality, more particularly in his thematic work. How much was his own? How much was folk-song? Writes one critic: "The wealth of harmonic invention of Grieg suggests a wonder whether, after all, much of the purely individual quality of his music has not been mistaken for a national vein." "Quite so," is Mr. Finck's caustic comment. He has already said, as to Grieg's songs, in his earlier volume, that "there is much more of Grieg in them than of Norway"; and this is not only his view, but his creed and passionate, not to say pugnacious, plea. As he puts it, an attempt is made in his book

"to assign to Grieg the rank which the author is absolutely convinced future generations will give him; in order to do so, it was necessary to destroy several absurd myths that have for decades been handed down from book to book and newspaper to newspaper, like hereditary maladies; notably the delusion that Grieg did little more than transplant to his garden the wild flowers of Norwegian folk-music—a delusion which has shamefully retarded the recognition of his rare originality; for, as a matter of fact, ninety-five hundredths of his music is absolutely and in every detail his own."

To speak, as critics have done, of Grieg's writing "in a dialect" makes Mr. Finck's blood boil. To the German critic who mourned that Grieg had "stuck in the fjord and never got out of it," he retorts that "Grieg in a fjord is much more picturesque and more interesting to the world than he would have been in the Elbe or the Spree." He points out that Haydn in Croatia did precisely what Grieg is called "unoriginal" for doing in Norway. Both borrowed phrases, strains, occasionally melodies, from their life-long surroundings, fashioned them anew, wove them into their compositions. As expressed by a writer in the 'Oxford History of Music,' "they renew with fresh and vigorous life an art that appeared to be growing old before its time." If this be borrowing, make the most of it, says Mr. Finck, practically. It would seem reasonable to allow the most original of composers five transplantings in every hundred melodies. Everything must reflect something. As Tyndall mourned because the Matterhorn was disintegrating, so we may prepare our tears against the day when all possible combinations of tones shall have been exhausted. Meantime it is safe to love the lovely. And meantime, too, our author specifically states that among Grieg's "72 works there are, besides three volumes of pianoforte arrangements of popular tunes, only three in which he has incorporated Norwegian melodies; all the others are his own." Concerning the position of Grieg in the future, neither arithmetic nor personal prepossession nor analogy can authoritatively speak. Mr. Finck thinks that as to songs he will ultimately be ranked second to Schubert only, and he has joy in pointing out which songs will be popular in the music-halls of the future. One of Grieg's most interesting traits is his attitude towards other composers. His appreciation of both dead and living among musicians, his catholicity no less than his sanity, are striking and exemplary. With Bach, Chopin, and Liszt among his idols, he has room in his affections for Mozart, Schumann, Verdi. With the work of Tchaikovsky, Dvorák, and MacDowell he is in admiring sympathy. Of Wagner he is an ardent admirer, but he has scant sympathy with "isms," and calls those who name themselves "Wagnerians" and "Lisztians" "a howling horde." "The great must be great," he writes, "and a comparison with other great ones must always be unsatisfactory." For his fervent biographer, in a task executed with infinite love and spirit, there can have been but one dash of bitterness: Grieg loves Brahms.

Memoirs of Dr. Thomas W. Evans: The Second French Empire. Edited by Edward A. Crane. Appleton & Co. 1905.

Dr. Evans is often unconsciously amusing in these memoirs; his attempts at assuming political importance leave one unconvinced, his judgments on men and things reveal more a mixture of naïveté and self-importance than anything else, and yet there is a residuum that has some claim to attention. For one thing, it is impossible to help admiring the whole-hearted devotion of Dr. Evans to his patrons, the French Emperor and Empress; and, further, his frequent contact with them enables him to throw out in strong relief the undoubtedly kindly and humane side of the character of Napoleon III. Apart from this, the book has little value. There is no serious evidence that Dr. Evans was ever initiated into State secrets; he was merely served with generalities, and so employed. One example of how he flounders in political matters will serve as an example. In the winter of 1868-69 Mr. Burlingame, at one time American minister to China, visited Paris at the head of a Chinese mission. Dr. Evans prides himself on having, at Napoleon's request, drawn up a report on the nature and object of

this mission, which enabled the Emperor to deal with it. He apparently was unaware, both then and at the time he wrote his memoirs, that the mission was little better than a farce, and that its credentials to the European courts were of the most insulting character. And so it is all through. Even in events he witnessed with his own eyes, his imperialist proclivities make him untrustworthy. Thus, he speaks of the "immense enthusiasm" when the army was reviewed after the Crimean war, yet this was the occasion of the pretty well known incident of the cadets of the École Polytechnique absolutely refusing to cheer for the Emperor. The account of Napoleon's attitude towards the North at the time of the Civil War is probably the most misleading chapter of the whole book.

The minor errors are numerous. As against this, one or two of the photographs reproduced are interesting, notably a charming one of Eugénie de Montijo shortly before she became Empress.

Some Books Issued in February

by

Henry Holt and Company 29 W. 23d St. New York

IMMIGRATION and Its Effects Upon the United States — By Prescott F. Hall

Secretary of the Immigration Restriction League.

This is probably the most exhaustive book on its subject. A description will be sent on application. It is the first issue in the important new series, **"AMERICAN PUBLIC PROBLEMS,"** edited by **RALPH CURTIS RINGWALT** of the New York Bar. (393 pp., $1.50 net. By mail, $1.62.)

***The next volume in this series will be Geo. H. Haynes' "Election of Senators." (March.)

THE NEGRO AND THE NATION — By George S. Merriam

This account of the negro question from the slave ship to Tuskegee, which is both entertaining and scholarly, is also believed to be the only history showing the relation of the negro to American politics from the earliest times till to-day. (436 pp., $1.75 net. By mail, $1.92.)

STUDIES IN AMERICAN TRADE-UNIONISM — J. H. Hollander, G. E. Barnett

Editors.

Twelve papers by graduate students and officers of Johns Hopkins University, the results of original investigations of representative Trade Unions. There are also chapters on Employers' Associations, the Knights of Labor, and the American Federation of Labor. (380 pp., 8vo, $2.75 net. By mail, $2.98.)

A leaflet on the publishers' books on public problems and economics sent on application

HEREDITY IN ROYALTY — By Dr. Frederick Adams Woods

A handsome and interesting book. A consideration of some 3,300 persons, presenting an interesting estimate of the mental and moral status of all Modern Royal families, and illustrated with over one hundred portraits. (312 pp., 8vo, $3 net. By mail, $3.18.)

NATURE AND HEALTH — By Dr. Edward Curtis

A straightforward, terse book by this well-known New York physician on the care of the body and the home. The subjects treated include Breathing, Eating, Drinking, Drugging for Delectation, Seeing, Hearing, Clothing, Bathing, Disinfecting, Exercising the Body, Exercising the Mind, Sleeping and Waking, Working and Playing, Living and Dying. (313 pp., $1.25 net. By mail, $1.37.)

GEOLOGY Vols. II. and III. — By Prof. Thomas C. Chamberlin and Prof. Rollin D. Salisbury

These concluding volumes are devoted to "Earth History," and in them Professor Chamberlin elaborates his weighty criticisms of the nebular hypotheses. With some 575 illustrations. 692+624 pp., 8vo, $8.00 net for both volumes—not sold separately.

Of the first volume of this Geology, the NATION said: "It is fully abreast of the latest research. . . . The illustrations are abundant, wisely chosen, and well executed. . . . The presence of small topographical maps engraved in colors and chosen to represent typical areas is a unique and valuable feature. While the work is intended primarily as a text-book for college students . . . nevertheless its readable style . . . cannot fail to commend it to any who may be interested in reading the story of the Earth. . . . Volume II. will be eagerly awaited."

THE SEAMAID — By Ronald MacDonald

The strange experiences of the shipwrecked Dean of Beekminster, his prim wife, his beautiful daughter, and others, on an uncharted island in the Pacific." ($1.50.)

THE NONCHALANTE — By Stanley Olmsted

The talented young American pianist, Mr. Olmsted, knows his Leipsic well, and has drawn from it the local color for his "Pleissestadt," in his story of American student life in that most musical of towns. Dixie Bilton, the American "operettensaengerin," is a unique and tantalizing character. ($1.25.)

SEYMOUR VANDELEUR

The Story of a British Officer

BEING A MEMOIR OF BREVET-LIEUTENANT-COLONEL VANDELEUR, D.S.O., SCOTS GUARDS AND IRISH GUARDS, WITH A GENERAL DESCRIPTION OF HIS CAMPAIGNS

By Colonel F. I. MAXSE, C.B., D.S.O., Coldstream Guards. With Plates from Water-colour Drawings by NICO JUNGMANN. Five Full-page Illustrations from Photographs and Nine Maps. Small 4to (7x10 inches). $4.00 net.

"We are glad that Colonel Ivor Maxse has found time to write the life-story of one of the most distinguished of the younger officers whose loss in South Africa this nation had to deplore. Seymour Vandeleur had the good fortune not only to see much service, but to see it in many parts of the Empire. The record of his life is therefore the record of our Imperial development during the past decade. . . . We do not know any other book which sets out so succinctly and clearly Imperial achievements which are wholly creditable, and which are too apt to be forgotten in the present windy war of theories. And in addition there is the portrait of a brilliant soldier, done with all the sympathy and knowledge of long friendship."

LONGMANS, GREEN, & CO., New York

THE LOVER'S RUBAIYAT A unique volume beautifully printed and decorated. An ideal gift for sweethearts and a novelty for collectors of Omar. By post 80 cts.
SMALL, MAYNARD & COMPANY
31 Arrow Street Cambridge, Mass.

LITERARY CRITICISM

Of English and American Authors.

JOHN LANE CO., The Bodley Head, N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 8, 1906.

The Week.

On Monday Mr. Roosevelt forgot for a moment the need of more battleships to put in a plea for additional coast defences. Our growing wealth, he explains, makes us really a more and more attractive morsel for foreign nations. There is so much money stored away in our insurance and safety-deposit vaults that some foreign "gobble-un" will certainly get us if we "don't watch out." Fifty millions is the modest sum required to complete in a modernized manner the fortifications projected by the Endicott Board, which have already cost more than a hundred millions. And then there are the insular possessions for whose fortification we are to spend nineteen millions, unless we desire Japan to gobble the Philippines, and England to pounce down on Porto Rico without a moment's notice. Guantánamo, San Juan, Guam, Subig Bay, Manila Bay, Pearl Harbor, and Honolulu are all eligible places in which to sink good money, while to fortify Panama will take five millions. These are some items in Imperialism's little bill Mr. Roosevelt would have us pay. And the worst of it is, as the President admits, the fashions in coast artillery change so rapidly that what is an enormously costly and valuable machinery to-day goes to the junk-heap to-morrow.

All the miserable calculations about how many wretched dollars our tobacco and sugar Senators have saved for their constituents by killing the Philippine bill, are quite beside the mark. Nor is it a question merely of one more Administration measure being slaughtered in the house of its friends. Beyond all these mercenary and political considerations rises the fact that the nation's good faith has been aspersed. There is involved a large matter of public policy, and not, as Senators pettifogging in behalf of their "interests" allege, merely a dispute over tariff schedules. We do not know, and we do not greatly care, whether the adoption of the reduced tariff rates proposed, with free trade three years from now, would enable the Filipinos to make a better living than they can to-day. That is not the real point. The true issue is one of sentiment rather than of trade. By the pledges of our Government, by the personal attitude of Secretary Taft and President Roosevelt, by the urgings of one Governor-General after another and the entire Philippine Commission, the Filipinos had come to think of the bill which the Senate committee throttled on Friday, as a crucial test of the generosity and sincerity of this country. Now they see all their hopes cast down. It is necessary to turn only to the warnings of Secretary Taft to understand how calamitous the effect upon them will be.

Secretary Taft made an important admission at last week's hearing before the Senate Philippines Committee. Hitherto he has insisted that only a few Filipino demagogues and hotheads desired independence. Now he states that a majority of the intelligent Filipinos are for absolute independence, and he would have been within the bounds of the truth if he had added that they want it right away and are as anxious as possible to get the Americans out of the islands. The Secretary, according to one report, then kindly explained that they were "a sentimental people, and that the ideals of independence appeal to them generally and unconditionally"—much, apparently, as they appealed to Patrick Henry, Benjamin Franklin, and a few other American sentimentalists. But Mr. Taft had his warning ready. Without the restraining power of the United States, there would be a reproduction of revolutionary conditions similar to those in South American republics. For that reason the United States, apparently, must continue to do policeman's work among a people who hate and despise us—and at a terrible cost. Senator Hale declared that every American soldier who goes to the Philippines "comes back a physical wreck." The Secretary felt that health conditions there were about the same as in the Southern States, and added that the ill-health of our soldiers was largely due to the drink habit, which is increased by lack of diversion. Surely, an admirable example for the temperate Filipinos! Thus, little by little, do a few truths about the situation in the Philippines leak out. It is admitted, for instance, that the United States does not dare to decrease its present regular-army garrison in the Philippines by more than 5,000 men, in the event of hostilities with China.

Senator Bailey, as a brother-lawyer admiring Mr. Foraker's constitutional argument, is reported to have said: "If that speech cannot be answered, the Hepburn bill ought not to pass." Very likely the Texas Senator believes that he himself can answer it. But there is one part of it which devolves upon the Administration to answer, if it is able. Senator Foraker charged in the most explicit fasbion that there has been "no serious attempt" by the Government to enforce the existing law against railway rebates and discriminations. After reciting the drastic provisions of the Elkins act of 1903, which the President at that time stated was all he wanted, the Ohio Senator declared that they had not been invoked as they should have been by the Department of Justice; and concluded that "the fault is not with the existing law, but with the officials who have not enforced it." It would be interesting to hear what the Attorney-General, by direction of the President, migbt have to say to this. His answer could scarcely be that he was so anxious for a new law that he forgot to exhaust the possibilities of the old.

The movement for consular reform, which was launched during the present session of Congress with high hopes, will clearly need the most earnest support of all its friends. It is one thing for a Congressman or a Senator to express benevolent intentions towards the merit system; it is quite another for him to vote to reduce the consular patronage by a whit. Accordingly, all persons concerned either in the extension of our foreign commerce or in the betterment of our consular system should note the call for a national consular-reform convention to be held at Washington on the 13th and following days of this month. All chambers of commerce, boards of trade, mercantile exchanges, and similar organizations are invited to send accredited delegates. The purpose of the convention will be to effect a permanent national organization, and to keep the cause constantly before Congress. That there is need of such combined effort needs no argument when Congressional committees are industriously engaged in amending nearly all tbe merit out of the bill which Secretary Root has been urging.

The action of the House Agricultural Committee in eliminating the free-seed item from the regular appropriation bill at least shifts the burden of proof to tbe advocates of this expenditure. Formerly it was the opponents who had to propose amending the bill, and they were invariably unsuccessful. Fondness for the free-seed distribution is not altogether an unamiable weakness on the part of our lawmakers. Like Sam Weller's crumpets, garden seeds are "so cheap and so wery fillin' at the price." In no other way could the members make little presents to so many constituents with so small a drain upon the Treasury. Of course, the pretence that the practice circulated new and val-

uable varieties of plants in new localities has been pretty largely abandoned. The greater part of the seeds now sent out under the frank have, in fact, been bought by the Government from ordinary commercial seed firms. So far as the distribution is legitimate at all—as it may be in the case of varieties introduced or developed by the Government itself—the Department of Agriculture can attend to it very much more efficiently than Congress.

At a meeting of the Commercial Club of Springfield, O., the recent scene of mob violence and incendiarism against the negro quarter—a meeting attended by the most prominent citizens of the city—it was stated that "the present conditions were due to politicians catering to negroes and low whites, and to the lax police and court methods." This is the reason for nine-tenths of the racial outbreaks the country over. A few years ago we called attention to a number of horrible burnings and inexcusable lynchings near Wetumpka, Alabama. For a time no one paid any attention to them. There was no State constabulary, no local police, and the sheriff was indifferent. But a new sheriff came in who saw that the whites were being degraded by this state of affairs quite as much as the blacks. So he organized a posse and cleaned up the county, sending several white men to the chain gang, and in all driving a round dozen of the offenders out of the county, which has been well-behaved ever since. Professor Royce of Harvard, in a recent address in this city, affirmed from his own study of the question in Jamaica, that the whole negro problem is nine-tenths or more a question of administration. Bad government is responsible for the outbreaks in Springfield, O., in Danville, Ill., in Mississippi, and for the two riots of recent years in this city.

In nominating candidates for Aldermen to be voted on in the April election, Chicago has made its first test of the new Illinois primary law. The result seems to bear out the claims made by its supporters. Not only was there an unusually heavy vote polled by both parties, but the candidates recommended by the Municipal Voters' League were, in all but two instances, successful. In only one ward, the Fifth, was the result undecided; Alderman McCormick and Patrick Carroll, a saloonkeeper, dividing the delegates to the convention exactly. Coming at this juncture, the primary was unusually crucial. In many wards the chief issue was between the high-license and the low-license elements. Chicago's liquor interests, naturally, do not want the saloon license fee raised from $500 to $1,000 a year, and in the wards where that question was raised the fight was bitter. In all, seventeen contests were made in the thirty-five wards. In eleven the issue was definite between the good-government forces and the saloons, and in three other cases there was a choice indicated by the reformers. Nine out of the eleven candidates endorsed by the reformers secured the delegates, and the three "preferred" candidates won.

We think the indignation of the investment community over the manner in which the "traction merger" promoters are treating shareholders, is altogether justified. The dealing with the street-railway investors, in particular, is not far from outright effrontery. The climax is the circular of disinterested advice to Metropolitan Street Railway shareholders, published on February 27 under the signature of three Wall Street Stock Exchange houses. This advice, the signatories declare, is given at the request of the company—"company" evidently meaning the officers who are endeavoring, through the merger, to void the lease of the street-railway system with its 7 per cent. dividend guarantee. This lease, it will be recalled, was the contract closed triumphantly by these very same "insiders" five years ago as a result of the meeting when street-railway shareholders were insolently bidden to "vote for the proposition first and discuss it afterward." The New York City Railway, which thereupon leased the surface lines, and the Metropolitan Securities, which owned the New York City Railway, went into the "deal" with open eyes. Their own lawyers averred in court, in April, 1902, that the 7 per cent. dividend guaranteed on Metropolitan Street Railway was a rental which the property "did not earn last year, does not now earn, and cannot earn for some years." This was their ground for asking the court not to interfere with the lease, since the facts, they urged, showed the good faith of the contractors. The lawyers' prediction has been verified; the 7 per cent. has not been earned, and the promoters of the scheme of 1902 are now laboring to break the lease and reduce the guarantee, through the subterfuge of the "traction merger."

This was a situation calling for the utmost candor. It was incumbent on "insiders," asking surrender of contract rights by the shareholders, to tell them what their company's earnings, assets, and liabilities actually were, and why the financiers who were so eager to pay and to keep on paying an unearned dividend, five years ago, are so alarmed at the prospect now. They have never given this information. Their call for assents of shareholders to the merger stated no particulars; it insisted on blind acquiescence. Finding the shareholders properly resentful of such disingenuous behavior, the same people induce respectable Wall Street houses to look over the company's accounts and publicly give judgment as to the property's deplorable condition. The same thing was done with holders of Metropolitan Securities; in that case a bankers' committee declared that the accounts "are so complicated that it is difficult to gain a clear idea of the financial situation." In advising surrender of the street-railway stock, the present committee remarks that "deficits will be so large as to seriously tax the resources of the lessee." In other words, because the man who insisted on paying a fixed lease for my property, and who would not listen to my objections to the lease, now finds the payment inconvenient, I must reduce the rent. We express no opinion as to the financial condition of the street-railway property. It may be fully as bad as friends of the merger are trying to make out. If it is, however, we submit that the people who have been managing the property since 1902 ought to render a prompt and full account of their stewardship.

Justice Deuel on Thursday accepted service of papers which mark the beginning of the effort to free the bench from his presence. He expressed himself as ready to join issue, and in nowise averse to the publication of the charges. If his attitude means a readiness to have the question of his fitness passed upon by his judicial superiors without delay, it is to be commended. Unless he is absolutely hardened, his present position must be extremely painful. Indeed, had he a delicate and sensitive nature like Mr. McCurdy's, the Justice would probably now be on the high seas or strolling the boulevards with James Hazen Hyde, instead of resuming his seat on the bench. His accusers have not stopped with a recital of his technical violation of the law by accepting other employment, but have boldly charged him with blackmailing—which is the proper designation of his activities in connection with *Town Topics*. The bench cannot be rid of him too quickly; its whole tone is lowered as long as he wears the ermine. If he were guilty of nothing else than aiding Col. Mann by reading the proofs of his filthy sheet, Justice Deuel would have shown that his moral fibre has been as completely eaten away as that of many a poor wretch whom he himself has sent to reformatory, workhouse, or jail.

The unimpeachable advice regarding fair play and the evils of athletic proselyting which Coach Reid of Harvard uttered recently before the Vermont University Alumni, is hardly so interesting or important as the confession which he made incidentally as to the

practices in which he himself has indulged. Deprecating the "encouraging of good athletes coming to Harvard for the sake of the athletic reputation of the institution," he proceeded to give as an example the case of a young Western athlete whom he brought on in order to have his services on the team, paying not only his travelling expenses, but practically his entire tuition and living expenses at the university. It was "with the approval of the athletic committee"—and this at Harvard, which has posed as the champion of pure athletics! Mr. Reid passes no harsher judgment on this than to call it professionalism, "in intent at least." Yet that very thing is the gravest evil of present-day athletics, and, if Mr. Reid has been correctly quoted, his was a barefaced case of hiring. There is no mention of cigarette agency, score-card concession, or even stewardship of a boarding-club. The fact is, that it has not been possible for any institution to join in the ugly scramble of present-day athletics without becoming itself corrupted. As the revelations are extended to take in one after another of the colleges which once boasted of athletic purity, it becomes more and more evident that this is no question of local symptoms, but of underlying and general causes that demand radical treatment.

There are two startling announcements in the annual statement of the First Lord of the British Admiralty published on February 28. After proposing to begin in the coming financial year four armored vessels and seventeen destroyers, the First Lord adds that it has been decided to adopt turbine machinery for all of them. It would appear that the victory of the turbine over the reciprocating engine is nearly complete, for the English navy sets the pace for the rest of the world. Our own Navy Department has finally decided to equip two or three of its new vessels with the turbine, but it is characteristic of the British Admiralty that, when it goes in for a new device, it goes in whole-souled. Sometimes, as in the case of the submarine, it is a long time in making up its mind, but the large number of these boats now built or being constructed—fifty-one—shows how thoroughly it intends to protect its coasts with this craft. The United States, on the other hand, is neglecting its torpedo work in comparison with other countries, and the Holland boat scandal has stopped all submarine construction. America being so great a producer of oil, one would expect the Washington officials to be the first to announce a determination largely to use oil for fuel. But this is the First Lord's second sensational statement: oil installations are to be made on all new vessels, and some of the older battleships are to be refitted with an oil-burning apparatus. For one thing, this must mean the storing of an enormous oil reserve in England for use in wartime.

It appears that the earliest dispatches gave a somewhat misleading account of John Morley's reversal of Gen. Kitchener's policy in Indian military administration. The new Secretary for India left it in no doubt, when a member of the Opposition, that he was in sympathy with Lord Curzon's protests against the attempt to deprive the civil government of India of full control over the military. On that issue, Curzon resigned as Viceroy; and it was naturally expected that Mr. Morley would take steps to restore matters to their former status. It was at first reported that he had done so fully, but it seems that the Secretary's action is in the nature of a compromise. In view of the fact that the new viceroy, Lord Minto, is quite content to let Kitchener have his head, the home Government could not very well order him to assert himself as Lord Curzon did until he was thrown over by Balfour. Accordingly, the decision was simply to strengthen as much as possible the powers of the military secretary in the Indian Council, thus enabling him to resist the commander-in-chief if he wishes to do so. Doubtless, Mr. Morley would have wished to go further; but he needed only to look into his own book on compromise to discover how necessary it sometimes is for a public man to accept accomplished facts and be guided by the combined wisdom of the Cabinet of which he is a member. Meanwhile, the struggle for the full supremacy of civil rule in India has been postponed.

The Rouvier Cabinet met a severe check on a military vote last week. The Socialists had determined to cut the annual training of the reservists and territorial troops in two, and they carried their motion by a plurality of seventy, in the face of the arguments of the Minister of War. But the Ministry had declined to make the vote a matter of confidence, and will not resign. To reduce the drilling time of the two classes of reserves to a mere fortnight and a week, respectively, would be to deviate markedly from the Continental standard of military efficiency. The fact that the French Socialists have taken so advanced a step in an anti-military direction at the very moment when war rumors abound, shows how strongly the anti-military reaction is working. Evidently the time has passed when France is longing for "a man on horseback" and the costly glories of war. The rebuff to the Ministry is an indication as well that the strict discipline by which the Radical-Socialist "bloc" has been held together is relaxing. Long ago M. Jaurès became a dissident, and apparently a large body of the Socialists is held to the Government by a very slender bond. One may imagine that the old-age pension bill was rather hurriedly introduced to warm up a cooling alliance; if so, the military vote shows that the expedient has not provided the requisite measure of *rechauffage*.

If France is subject to a certain suspicion and handicap in all the parleying about Morocco, the fault is that of the exclusive protectionist policy which she has pursued in Madagascar and elsewhere. Should the negotiations take a turn looking to French control and final absorption of Morocco, there would be need of very explicit stipulations guaranteeing the open door. Of course, both Germany and France say they are ready to promise that; but it will be remembered that Lord Salisbury thought he had a similar pledge respecting Madagascar, though the French Foreign Minister, M. Hanotaux, found a means of evading it. It has unfortunately been the fact that international merchants have come to regard territory annexed by France as practically shut up to all but French trade. We have heard one large shipper say that an island or province with the tricolor over it might as well be sponged from the map, so far as equal privileges of trade are concerned. The same might be said of the American flag; and it does not lie in our mouths to reproach the French protectionists and colonial exploiters. We merely remark that they inevitably incline people to suspect their country, as ours do the United States, in intertional arrangements affecting trade.

The Czar's declaration concerning the functions of the Duma is, so far as it goes, reassuring. It promises for the popular assembly the usual legislative powers, where these do not conflict with the Imperial prerogative. In all but dynastic matters, the Duma is to have the attributes of a parliament. If this statement could be taken literally, it would indicate that the Czar has accepted the Liberal programme *in toto*. So bold and sagacious an act could hardly fail to check popular discontent and divert the reform movement into loyal channels. But, unhappily, former statements of the Tsar have been subject to perverse interpretation, or even to sudden reversal, and the worth of the present promise depends clearly upon the practical fulfilment of it when the Duma meets. In the intervening weeks much may happen to change the Tsar's generous sentiments. Meanwhile, the mere admission of the idea of a responsible parliament by a Romanoff has a considerable value.

THE SENATOR AND THE UNIVERSITY PRESIDENT.

Senator Foraker closed his speech on the railway-rate bill on February 28 with a frank statement of the personal difficulty in which he found himself. He disliked exceedingly to differ with the President. To put himself at variance with party colleagues was also distasteful. He knew, too, that he should be "arraigned before the country by unfriendly critics as prompted by unworthy motives." But, he added:

> "No man who allows himself to be controlled against his judgment by considerations of this character can do his duty or maintain his self-respect, or be entitled to retain the respect and confidence of his colleagues and constituents. If we enact this measure and it proves disappointing, as I believe it will, the people will not hear us to say in our defence that we legislated in response to their demands. They expect their representatives, especially in this body, with respect to questions of this character, to act intelligently, patriotically, and in accordance with their judgment and their oath of office, which binds them to disregard public clamor and legislate for the public welfare as they see and understand it."

Saying nothing for the moment of the merits of Mr. Foraker's argument against the Hepburn bill—though all agree that it was powerful—his statement of the duty of a public man to follow the light within his own breast cannot be controverted. It is, however, all the more notable, as coming from a politician, because we have lately had the contrary view upheld by a scholar in politics. President Hadley of Yale University published on February 24 an article on the Hepburn bill, attacking it, in his capacity as a railway expert, as severely as Senator Foraker does in the guise of a lawyer. Yet he wound up by saying that he felt it his duty, as he believed it the duty of Congress, to waive all individual convictions, and accept the Hepburn bill unamended, simply because the country is "in the midst of a great wave of moral sentiment," and it is better to "acquiesce in a measure" which the President approves.

To show how solid is the conviction which President Hadley builds up in order to swallow, we will quote a few of his characterizations of the Hepburn bill. Practically, and judging by English experience as well as our own, he thinks there is "reason to fear that this plan will not work." "I believe that evil and not good will come of the Hepburn bill." "If anybody is much harmed by illusory attempts to limit rights of appeal, it will be the shippers." "The combination of these three functions [advisory, prosecuting, and judicial] in one office is repugnant to the Constitution of the United States, to common law, and to the American sense of fair play." "I cannot concur with the President in believing that the Interstate Commerce Commission is the proper body for judicial determination of rates." There is much more of this, but at the end we get the great act of faith which leads President Hadley to conclude: "The position of many of the Senators and Representatives that they will stand for a bill which has the approval of the President, and not for one which fails to have his approval, is in my judgment a wise one."

We should hate to see the freshman class in logic set to explaining these excitations of the Yale president. "Let us follow the argument," Socrates was wont to say; but President Hadley's exemplar is apparently that old English divine who thought any logic "wicked" which did not, whatever the premises, make the praise and glory of God come out in the conclusion. But the matter goes deeper than perversity of reasoning. What is to become of us if our leaders of thought deliberately advocate surrendering to what they believe a passing craze? How are we ever going to get wise and matured legislation if the men who clearly point out, as President Hadley does, that the Hepburn bill is "based on bad principles," are yet ready to consent to what they describe as a great evil merely because not to surrender would engender a "spirit of distrust and class antagonism"? Such an attitude as that of President Hadley's is not simply one impossible to defend in itself: it directly invites public evils to which the evils which he foresees from the Hepburn bill are as the small dust in the balance. All that any demagogue would need to do would be to threaten "deep-seated misunderstandings" and "bitter class struggles," in case any nostrum of his were not accepted, and the men of intelligence and character would have to yield in terror. Where can the line be drawn? If we must not oppose a bad railway bill lest Government ownership be next brought forward, how could we withstand Government ownership if its champions talked darkly of worse behind?

President Hadley deprecates a "factious opposition" to the Hepburn bill, or any amendment of it which will not "satisfy" Mr. Roosevelt. But the real question is whether he would deny the principles stated by Senator Foraker. If intelligent men are to hold up their hands at the first demand of the demagogue, what chance is there of resisting his second and third demand? We shall have taught him the trick, and he will not be slow to apply it on every occasion. What need he care for your arguments, your warnings, your law, your precedents, your demonstrations, if you announce in advance that you will abandon them all if he only threatens loudly enough? We can never, in a democracy, get away from the duty of every man standing up stoutly for what he believes to be right and just. If our men of leading are to go hastily with the crowd, such a thing as a led democracy will disappear. President Hadley defends his sinking of his own convictions of justice on the ground of public policy. But he would have done well to have taken counsel of that great political thinker who said: "It is with the greatest difficulty that I am able to separate policy from justice. Justice is itself the great standing policy of civil society; and any eminent departure from it, under any circumstances, lies under the suspicion of being no policy at all."

THE "SQUARE DEAL" WITHOUT DETAILS.

It was a great public service which the *Tribune's* Washington correspondent did last week in giving us an exact account of the railroad-rate bill which the President really wants. Admitting that there has been "considerable haziness" on the subject among even the "ordinarily well-informed members of Congress," the correspondent proceeds to blow away the last vestige of the haze as follows:

> "Among those who have enjoyed the President's confidence, however, in the last few weeks no misapprehension exists. They know plainly what he wants, for he has not at any time disguised his course or his feelings. He wants a rate bill that will be fair to shipper and railroad alike; that will put an end to the present discrimination against individuals, commodities, and localities; one that will go into effect as soon as possible, and one that will hold water in the highest court of the land."

This reduces the whole complex matter to simplicity itself. The recipe is as admirable as the dear old prescription of Republican platforms for framing a protective tariff. Do we not all remember it? "A tariff so adjusted as fully to protect American labor without unfairly burdening the consumer, and levying such a tax upon foreign goods as will not expose American industries to unfair competition from abroad nor permit them to form oppressive combinations at home, etc., etc." It is a very butter-woman's jog-trot of meaningless generalities, which any man could rhyme you on any subject by the hour. We know that tariff "square deal," with details carefully withheld, and it begins to look as if the railway square deal were like unto it. The President's attitude, so bluff, so hearty, so straightforward, has a resemblance to that of the Czar who was consulting with the engineers about the first railroad from St. Petersburg to Moscow. He finally laid a ruler on the map, drew a straight line between the two cities, and said, "Build me that road." Similarly, the President directs Congress, "Pass me a railway bill which shall give a square deal to all concerned."

Now, if Congress could only get on without having actually to study phraseology and legal effect and constitutionality, nothing could be finer than

this. A joint resolution embodying the President's language would pass both houses without a single vote in opposition. The railroad Senators would rise as devoutly as Dolliver and Tillman to vow, with their hands on their hearts, that they favored the squarest of square deals for shipper and carrier alike, the Supreme Court not forgotten, and would then be ready to sing the doxology. But, unluckily, that sort of thing does not "get us forrarder." Somebody, in the end, has got to buckle down to the disagreeable work of examining the language of the bill, balancing its clauses, scrutinizing each provision, mastering railway practice, collating decisions of the Supreme Court, and looking before and after like reasonable beings engaged in crucial legislation. In this business, general principles, even of the most glitteringly platitudinous sort, are not of the slightest help. A young Oxford graduate whom Lord Salisbury was proposing to take into the Foreign Office, expressed the hope that he would not be too much "vexed with details." "My dear sir," said the seasoned statesman, "details are everything." They certainly are in framing a statute to regulate a business capitalized at more than $14,000,000,000.

It is really a sort of French idea of legislation which the President appears to have in mind. An old fashion of the Chamber is to accept a measure *en principe*. This is sometimes done with great effusion and enthusiasm, the Deputies embracing each other with tears of joy. But thereafter the law has to be sent to committee for *rédaction*, and then the miserable "details" get in their work and there is the very devil to pay. Sometimes the bill is never heard of again; it expires in the vain endeavor to disentangle itself from general principles and take on specific and legal form. Still, there has been the great rejoicing over the adoption of the "principe," just as Senator Dolliver said on Thursday the American people were rejoicing over the new rule for legislation by Congress, that is, the "square deal." If the details are awkward, why, just omit them, and pass on to the next occasion for being tremendously square but conveniently vague.

The great distinction of Anglo-Saxon legislation, as contrasted with the French, is, as Sir Samuel Romilly long ago insisted, that it is immersed in the concrete. It does not know how to separate *principe* and *rédaction*. The principle that cannot be reduced to precise terms, does not exist for it. If you are unable to state your grievances in writing, or to propose their remedy in a bill which will hold water, then go your way and hire a hall, but don't come to Parliament or Congress. Those are places only for men who can think in terms of statutes. And these legislators, who actually have to draft bills knowing that the minutest shading of phrase, or even the punctuation, may make all the difference in the world, understand that what they have to do is, not to legislate grace, mercy, and peace, or even the square deal, into existence, but to find the specific legal remedy for specific abuses. If they are stanch in their duty, they will say, "Keep your square deal for outside consumption, but give us the details of your bill. Tell us exactly what form of judicial review will be satisfactory to you." And when Senator Dolliver talks about "a storm brewing" over the fact that "some men in a few years make hundreds of millions of dollars," they will ask him to take the bill and show where anything of that kind is written in it, or what it has to do, anyhow, with the obligation of representatives sworn to uphold a Constitution that forbids taking away any man's property without due process of law.

SHOE PRICES AND FREE HIDES.

The news that the price of shoes will have to be raised in the near future unless something is done about the tariff on hides, was the most important, so far as the general public is concerned, that came from the convention of the National Boot and Shoe Manufacturers' Association in this city a fortnight ago. The National Shoe Wholesalers' Association meeting in Boston five weeks ago took the same view. The Massachusetts State Board of Trade more optimistically passed on February 27 a resolution stating its belief that removal of the tariff would cheapen "heavy staple shoes worn by farmers and laborers." The helpless consumer, however, though he has grown used to similar experiences, is waiting apprehensively for the new prices to go into effect.

The ready-made shoe is, in fact, something more than a common article of trade. It is at once a social institution and a barometer of the cost of living. Such shoes are made, to be sure, in various qualities and at various prices, but there is a sort of standard middle quality which is advertised so widely and by so many firms that no one can help knowing about it; and it is probably worn by more people than any other grade. This was once the $3 shoe. It is now the $3.50 shoe. One of these days we shall wake to find that it has become the $4 shoe.

Perhaps the most striking thing about the present situation is that there is nowhere apparent any disposition to regard the proposed advance of prices as an extortion, as people do when they have to pay more for meat or oil. Alone among manufacturing interests, the shoe men seem to have been able to convince their customers that higher prices are really a regrettable necessity. In the first place, there is no Shoe Trust. The shoe industry is one of the last footholds of free and general competition. But, besides this, it is an industry which, instead of asking Government favors, is perfectly willing to relinquish the present 25 per cent. duty on its finished product, if it can only be relieved of the 15 per cent. levy on its raw material.

While no one is foolish enough to expect anything to be done by Congress to remedy the present conditions, there has been a good deal said this year on "the state of the Union," in which the price of footwear is not an insignificant factor. Even the Hon. Augustus P. Gardner of Massachusetts admitted that 65 per cent. of the manufacturers in his district would be willing to have the shoe duty abolished, though he insisted that the other 35 per cent. would "concede a reduction, but cannot consent to the entire removal of it." Mr. Perkins of New York, a stanch Republican, combating the idea that the hides question was a local one, affecting only Massachusetts, recalled that the delegations coming to Washington this year to ask the removal of the duty included manufacturers from Rochester, Chicago, Milwaukee, St. Louis, St. Paul, and Minneapolis, besides the Massachusetts towns. This is a national issue even as regards the location of the industry affected, while it is hard to imagine any business move more universally felt than a change in the price of shoes.

As to the precise relation of the hides tariff to the market price, estimates differ. Mr. Perkins argued that even if the tariff added only two cents a pair to the cost of making shoes, it ate up about one fifth .of the average profit. Gov. Douglas of Massachusetts, in a letter printed in the *Congressional Record*, said on this point:

> "The hide duty adds about seven cents a pair to the cost of producing the grade of shoes I manufacture. I also wish to make it quite plain to the public that, while an increase of but seven cents in the cost of manufacture of a pair of $3.50 shoes may seem a small and unimportant matter, that amount represents more than the net profit of the average manufacturer. . . . To put $2,250,000 into the Treasury of the United States as the result of the duty upon hides, we put about $7,000,000 of unnecessary tariff profit in the hands of the Beef and Leather Trusts. This puts an iniquitous tax upon the sole-leather industry of about $10,000,000, and disables that industry in its fight for the markets of the world."

And what is the argument on the other side? Apparently, there is none except ridicule of the idea that two or seven cents is worth worrying about, and the assertion that the shoe industry is doing very nicely as it is. Nobody longer has the face to declare that the schedule does the farmer any good. As James G. Blaine said when the McKinley law was being framed: "It will benefit the farmer by adding 5 to 8 per cent. to the price of his children's

shoes. It will yield a profit to the butcher—the last man that needs it." His prediction has been more than verified. The farmer gets no more for his cattle than he did before the duty was clapped on. In this country, cattle are not raised for their hides in any case, and no one seriously supposes that the supply would be reduced by the smallest fraction were the tariff to go. The fact is, this country at present uses up the hides of all its own cattle—raised primarily for food purposes—and then goes abroad for what it needs over and above these. Although only one-fourth of the quantity used is imported, the price of the three-fourths of domestic hides is kept at an artificial figure by that fraction. By far the larger part of the enhanced price goes straight to the great packing houses. As the president of the Boot and Shoe Association affirmed, an increase of 28 per cent. in the cost of raw material had been accompanied in the last three years by a 25 per cent. increase in the cost of labor.

The American shoe is a product in which the country takes a genuine pride. Yankee ingenuity, business methods, and talent for organization have made it what it is. Henry James found it one of the things worthy of inclusion among the impressions of his recent visit here. And just because it is willing—the metaphor forces itself—to stand upon its own feet, because it is not controlled by a monopoly, we must, forsooth, continue taxing it for the benefit of two other Trusts.

DREAMS OF YOUNG SOCIALISTS.

It would be easy to poke fun at the group of social reformers who have been holding a three days' meeting in a home of luxury to denounce wealth. If the Germans have their Socialists of the Chair, we have ours of the Easy Chair. The real fighting Socialists, down in the grime and murk of it, living on $20 a week, organizing in back-rooms and proselytizing through midnight meetings in the streets; knowing exactly what they want and working for it year in and year out, election after election—their sense of brotherhood born of desperate struggle, and poverty with them something burnt into the blood and not a literary material—such Socialists, we say, might well be excused if, at the sight of dilettante writers and inheritors of great fortunes going to discuss Socialism at dainty breakfasts, they should exclaim, "Oh, wonderful, wonderful, and most wonderful wonderful, and yet again wonderful, and after that out of all whooping!"

We feel, however, that though it is impossible to take this combination of magazinists and millionaires very seriously as individuals, we are bound to reckon with the sentiments which vaguely agitate their breasts. Youthful enthusiasms like theirs always signify. The significance is not ordinarily what they think it. As Lowell said of himself, it is easy for boys who know that they are excited to believe that they are inspired. Yet it remains true that young men have often a prophetic sensitiveness to coming ideas and movements. The dreams of their youth sometimes become the realities of their old age. This is why no interested observer of the political ebb and flow can afford to neglect what the young men are reading and thinking and hoping. In this sense, at any rate, the Noroton conference is entitled to the benefit of the saying, *Maxima debetur pueris reverentia.* It is true that some of the conferees would have to seek advantage of the English decision that a man is to be held "young" until he is sixty; but most of them are engaging youths, whose humanitarian impulses we must respect even when we find their reasoning shallow and muddy, and whose attitude and talk are a sort of instructive experiment in the actual working of socialistic notions.

They show us, for one thing, how vain, as a rule, are the attempts to check Socialism by placating it. Some people, of course, in political theory as in theological doctrine, are willing to stop in a convenient half-way house, but with the mass, and in the end, logic will have its way. The amiable young Mr. Patterson of Chicago shows the true inherent tendency. A year ago, he was happy in municipal ownership as precisely the instalment of Socialism with which we ought all to be content. But he has now moved on—much faster than municipal ownership in Chicago—and wants all the means of production to be assumed by the Government. His arguments are innocent-minded in the extreme, but his motives are humane, and he illustrates neatly the natural course of the socialistic disease. To conciliate Socialism by becoming socialistic is an attempt that has often been made, but its invariable result is failure. Germany furnishes the classic example. Her great, intricate and costly scheme of workingmen's insurance was taken up avowedly as a means of staying Socialism; but the Social-Democratic vote has gone on mounting even faster. To expect anything else would be to ignore human nature in the Socialists as much as they ignore it in others. One may, of course, support a measure which is dubbed socialistic, and may do it on grounds of public interest and justice; but let his arguments be directed to those points, and stick to the merits of the particular scheme; for the surest way to provoke and bring on an excess of Socialism is to contend that it will come unless we assent to a modicum of it. What we are to assent to is a business proposition, or a measure of proved public utility, never to Socialism as a means of staving off Socialism.

It is highly probable that we are in for socialistic movements in this country of greater range and vitality than any we have as yet known. The ideas are certainly in the air, are infecting the most unlikely persons, and will doubtless run their course. But Socialism, after all, will find that it has to face the same old problems that have perplexed the framers and operators of government from the cave-man down. These relate chiefly to fundamental human qualities—ability and character. How can we best draw out ability? How can we keep our public servants honest? Any man who can surely and satisfactorily answer those two questions, may be said to have solved both the social problem and the governmental problem. But he will have to begin, if he is honest, by admitting that industrialism and the rewards of wealth have been wonderful developers of able men. Has Socialism any such spur to ability? If it has not, it has no philosophical justification, and will not long be tolerated by men who believe in human progress by individual variation and distinction. And the socialistic régime would be no better than the present, governmentally, unless better men were produced to administer it.

There will be no happy-thought regeneration over-night of that hoary old sinner, the world. It is a vast complex of life, in the coil of which we are all caught; and it is well for none of us to imagine that he has in his keeping the secret of universal happiness. No movement can be so critically important as some movements think themselves to be.

GREAT FORTUNES, OLD AND NEW.

The well-known authority in economic history, Vicomte Georges d'Avenel, has an article in the last *Revue des Deux Mondes* on the millionaires of other days. It is the first instalment of a study which he is making of great fortunes during the past seven hundred years. His aim is to work out, on the basis of the most complete documentation and careful comparison, the actual extent of accumulated wealth in France, century by century, as held by the men who were the richest of their respective generations. His conclusion, after minute inquiry, is that "the very rich of today are six times as rich and (of equal fortune) twelve times as numerous as the rich men of the *ancien régime;* and are ten times as rich and twenty times as numerous as the most opulent princes of feudal times."

M. d'Avenel's point of departure is the 1,000 persons in the present French republic who have an income above $40,000. Of these, 350 enjoy a revenue of $100,000 or more; 120 have annual re-

ceipts of more than $200,000; 50 an income of $600,000, while ten or a dozen can count upon $1,000,000 a year. These figures are drawn mainly from court documents having to do with the inheritance tax. Going back to ancient records, and translating their terms into the equivalent of the money-value of today, M. d'Avenel declares that *nobody* in the Middle Ages could be compared in wealth to the 50 richest men in France at present. Nobody, he adds, from the thirteenth to the end of the sixteenth century had as much as $1,000,000 a year. The outlay of Louis IX. in 1251, the year of the crusades, did not exceed $775,000. And we may trace royal and princely budgets down to the Duke of Orleans and Richelieu and Mazarin before we find a personal income of $1,000,000. Louis XIV. had his $4,000,000 a year, and Napoleon his $5,000,000, but those sums were subject to an enormous drain, of the nature of public expense, such as no millionaire of the present day has to reckon in his budget. Among strictly private citizens, asserts M. d'Avenel at the end of his long researches, there was not one Frenchman before the Revolution who had an income of $1,000,000.

But this new wealth differs as much from the old in nature as in extent. The rich men of six or seven centuries ago were mostly landed proprietors. Their property came to them, as a rule, through conquest, or as booty, or through royal gift. Vast estates with an army of retainers and tenants meant a large gross product of the necessaries and comforts of life, but not a business capable of great expansion. Fortunes did not roll up from generation to generation; they usually tended to dwindle. It was not until the modern industrial world was ushered in that the vast new rewards for captains of industry and organizers of commerce gave them such a large share of the wealth which had been created under their hands. This is M. d'Avenel's main point. The rich are so much richer and more numerous today because of the actual creation of new stores of wealth. The large modern fortunes have come contemporaneously with a great improvement in the condition of the laboring classes whose wages in France, M d'Avenel declares, have doubled during the period he has under review, while the cost of living has sensibly diminished. It is the new wealth that has made the new millionaires. Following hard upon legislation which aimed at absolute equality among citizens, the inrush of wealth-creating facilities has brought about greater inequality of fortune than before.

Such an investigation as that we have barely outlined, shows how little, after all, legislation can do to make head against human nature or against a great scientific and civilizing movement. France is the country above all others in the world where laws are framed with the most passionate devotion to logic; and an avowed goal of French legislation has been, by interference with the right of testamentary disposition of property and by taxation, to render fortunes as equal as possible. But we see what glaring inequalities remain. Law and governmental theories are powerless before the developments of science, the expansion of commerce, the creation and satisfaction of new wants among millions of people. The law did not give these, and it cannot take them away. And we do not believe that there is so formidable a jealousy and hatred of wealth, in itself, as is frequently alleged to exist and to be growing. The sting lies in wealth unjustly acquired. It is ill-gotten gain, flaunting itself, that is the greater breeder of Socialism. Wealth fattening upon special privilege, corruptly obtained—such as the protective tariff—is the thing which inevitably and righteously provokes discontent in a republic; and for the removal of that privilege, for the abolition of all legal discriminations in favor of the rich, lovers of the only real equality among men—equality before the law—may well strive unceasingly.

STAGING SHAKSPERE.

Mr. John Corbin, in the current *Atlantic*, attempts something like a reconstruction and defence of the Elizabethan stage. He shows conclusively that, contrary to the representations of some literary historians, that stage was by no means barren or artless, and that its methods were far from puerile. The costuming, for example, was of the richest sort. There was no lack of properties called for by the action. The playhouses compared favorably in size, and assuredly in architectural propriety, with our own. Since the stage projected into the pit and the actors were, in a sense, among the audience, the scenes were planned for plastic rather than pictorial effect. There was no front curtain, and changes of properties usually took place unobtrusively while a vivacious front-stage scene was in progress. The simplicity of the arrangement, while permitting great lavishness of costuming and decoration, taxed the actor heavily—for he never sank into the picture—and made equal demands upon the dramatist, who had neither the aid of specific back scenes nor that of the curtain drop. His task was to provide a closely knit and practically continuous action—to charm his audience by sheer histrionism.

For a revival of this method of presenting Shakspere, Mr. Corbin makes a very temperate plea. So far as this means abolishing the tedious waits incident upon elaborate setting, and giving the text without serious abridgment or rearrangement, we heartily agree with him. The performances of Mr. Ben Greet's company, in spite of their evident deficiencies, at least proved that Shakspere should be played swiftly and continuously, and that the costly and elaborate mountings of recent times are not only superfluous, but positively detrimental. These confessedly mediocre performances of practically the entire text make the elaborate revamping of Shakspere "acting versions," from Nicholas Rowe's time to our own, seem very like a stupendous sacrilege. Mr. Ben Greet's considerable financial success has also proved that the over-elaborate scenery and consequent mutilation of the book, professedly the sole means of attracting the modern public, are in reality so many concessions to stupid traditions of stage managership.

But it is one thing to say that Shakspere is perverted on our stage, and another to urge the restoration of Elizabethan modes. No one seems to have perceived the paradox that, except as an academic recreation, the return to the Elizabethan stage is the most insincere of all archæological revivals. Mr. Irving's, even Mr. Daly's, archæologizings had the merit of representing Shakspere's imaginary world with some regard for historical propriety, and at least in conformity with nineteenth-century habits of visualization. To reproduce the costuming and setting of Shakspere's time is to assume to see with the mind's eye of his contemporaries—a laudable diversion in a student of the stage, a patent insincerity in the average playgoer. In short, the true imitation of the Elizabethan theatre would require in the pit and on the stage alike a royal indifference as to the exact locality of the scenes and a complete ignorance of the walk and habit of earlier times. One might conceive a genuine Elizabethan revival on the exposed stage of a continuous performance theatre. *Romeo* should attend the Capulet's ball in a claw-hammer coat; *Juliet* should receive him in the white chiffonery of a débutante; *Cæsar* should stalk in the trappings of a lieutenant-general of the United States army; *Hamlet* in the modest frock coat and spats that princes affect in their unofficial visits. That would be as near a genuine Elizabethan performance as our times may hope to compass; to facsimile the Globe, the Swan, or the Fortune is mere archæology, and has little to do with the actual problem of staging Shakspere aright.

The study of the Elizabethan stage has at least shown that the performance of Shakspere should be continuous—Mr. Ben Greet's players, giving nearly the entire text, usually finish an hour earlier than our elaborate revivals, which cut the book severely; and that scenery and properties should be simplified to con-

form to this condition. All this is quite compatible with the structure of the modern stage. A skilful use of front drop scenes, against which modern managers entertain a singular prejudice, will usually give time for the preparation of the necessarily elaborate settings. The main thing is that no changes should be made at the cost of delaying or interrupting the action or of sacrificing the text. If this cardinal principle be adopted, it will follow necessarily that the scenery and properties must be of a simple sort, typical rather than realistic or sumptuous; in short, just about what an Elizabethan playwright would have demanded if he had foreseen the curtained stage and the invention of sliding "flats." Any one who is familiar with the classic stage in France, knows the advantage of what may be called typical scenery—something that is vaguely a palace or a bourgeois interior, a forest or a plain. That Shakspere sacrificed this advantage was due, presumably, not to his conception of the drama, but to the physical limitations of his stage. But there seems to be no good reason why we should deny to his text the facilities he would have welcomed joyfully.

Performances of the sort outlined above might confidently count upon public support if the acting were merely tolerable. Purists will hold that out of this compromise with modern stage conditions might come a further and spontaneous reversion to the Elizabethan mode. One may imagine plays given before a sumptuous but purely generalized background which should stand at will for any local habitation of the dramatist's imagination. With such a fixed decoration, the use of the curtain and of the drop scene might be reduced to the minimum, and we should have what would be in spirit a revival of the Elizabethan manner and, incidentally, perhaps, the ideal setting for all poetic drama. What stands in the way both of the practical compromise and of the not impossible ideal we have suggested is not the absence of good will in the public. The hindrance to both projects lies rather in narrow traditions of stage managership, and, more seriously yet, in the almost complete absence of players who can either assume the carriage, or properly recite the lines, of Shakspere's characters.

THE POLITICAL SITUATION IN ENGLAND.

LONDON, February 20, 1906.

The political situation in England may be regarded from two different points of view. We may, on the one hand, note two or three striking political facts which are as novel as they are important; we may, on the other hand, turn our attention towards the peculiar position of public opinion with regard to facts of which no one can deny the existence.

Three facts dominate the whole situation. The first is the complete rout of the Unionist party; the followers of Mr. Balfour and Mr. Chamberlain, as well as the Unionists who have been mainly guided by the Duke of Devonshire, have suffered an almost unprecedented reverse. It certainly cannot be paralleled by any political disaster which has befallen a political party during the last seventy years. To find anything comparable to the defeat of 1906, we must go back to 1832, and recall the election which followed upon the passing of the Reform Act; the great Tory party, which had ruled the country for some sixty years, was represented in Parliament by less than 200 members. Observers of the day thought for the moment that Toryism was annihilated, and that the Reform Act was only the opening of a sudden and complete democratic revolution. The knowledge that, within two years, Toryism, under the guidance of Peel, had been transformed into Conservatism, and all but balanced the power of the Whigs, conceals from critics of the twentieth century the reasonableness of the belief in 1832 that years must elapse before the classes which had ruled England could recover any authority. The recollection of the revival wrought by Peel may possibly cheer the Unionists of 1906, but it is absolutely necessary that they should in the first place realize the greatness of the disaster they have undergone.

The second fact is the creation of the Labor Party. We may safely say that, even immediately before the general election, no leading statesman had anticipated the triumph of the wage-earners. Acute observers had, no doubt, noticed the growing deference paid by members of Parliament to the wishes of trade unionists. Such observers felt that, by degrees, the artisans of the towns, as also the country laborers, would learn their power and exert an influence far greater than they had hitherto exercised, but few were the men of the middle classes who, whether inside or outside Parliament, anticipated that the Labor members would, after the general election, form a body of at least fifty men, and, as we may safely conjecture, be able to influence the votes of at least fifty members who are neither workingmen themselves nor strictly the special representatives of workingmen.

The appearance in Parliament of the Labor Party shows, it has been said, that democracy has come of age, and, like most persons on obtaining their majority, is determined to take the management of affairs into its own hands. The existence of the Labor Party bears witness, it is true, to the progress of democracy, but it does far more than this—it proves the growth, not exactly of Socialism, but of socialistic ideas; it shows, moreover, and this is the circumstance which most naturally excites alarm, that the body of wage-earners are inclined to form a parliamentary party which shall avowedly and primarily further the interest of a class rather than the interest of the nation as a whole. Let me not be misunderstood. Every class, when it has the power, legislates, though often quite unconsciously, with a view to its own interests. The landowners, who were dominant in the Un-Reform Parliament, undoubtedly showed a strong bias in favor of legislation which was supposed to favor the interest of country gentlemen. The ten-pound householders, who gained power under the Reform Act of 1832, assuredly displayed a tendency to pass laws which promoted the objects dear to the middle classes; but neither the landowners nor the ten-pound householders ever chose representatives whose deliberate object it should be to legislate in favor of the land or trade. The peculiarity of the Labor Party is that it, nominally at least, exists to look after the well-being of a particular class. An optimist may find reason to hope that the working-classes may not in the long run adhere to the idea of legislating for the good of a particular class, and that they will look at national affairs from a national point of view; still, optimism is no very safe guide, nor, it may be added, is pessimism. All one can say is, that at the present moment the Labor Party in its adherence represents the interests of a class in a way in which no English party has ever done before.

The third fact is, the strange want of any political guides to whom the nation can look up with special confidence. Mr. Balfour and Mr. Chamberlain are men of talent, and have at times enlisted large bodies of admiring followers, but their following is for the moment all but destroyed. In any case, they are generals who have so conducted their campaign as to lead a huge army to ruin. It is impossible for leaders who have been defeated to claim or receive the trust due to success and victory. At Birmingham they trust Mr. Chamberlain, Mr. Balfour has still in Parliament ardent friends; but no impartial critic can pretend that, throughout the nation, there is any feeling of ardent enthusiasm for the two men who were the most conspicuous figures in the cabinet of which Mr. Balfour became the head. Nor is the Liberal Party richer in leaders who excite national enthusiasm than is the Opposition. Campbell-Bannerman is certainly not what you call in America magnetic; he is not a thrilling speaker; one is told that in the House of Commons he reads his speeches. If they are written, they have certainly not the merit of epigrammatic terseness or literary polish. The last quality which any one ascribes to a Scotchman who describes himself as "canny," is the capacity of exciting enthusiasm. He has many respectable and some few eminent colleagues, but it would be idle to pretend that any one of them arouses the kind of enthusiasm which in very different ways was excited by Gladstone or Disraeli; none of them commands the kind of trust which large bodies of men gave, whether rightly or not, to Peel, to Lord John Russell, or to Palmerston. The Government possesses an overwhelming Parliamentary majority, but it does not possess a single man whom we in flattery can call the idol of the nation or even of the Liberal Party.

So much for the political facts; turn now to the condition of public opinion. On all hands one hears about proposals for change. It is certain that the Labor Party, at any rate, hopes for measures which, whether wise or unwise, may certainly be called revolutionary, not because they are likely to be accompanied by violence, but because they touch the very basis of English social life. If any one is inclined to deny this, let him consider the immense effect which,

whether good or bad, must be produced by the attempt to provide the people of England with a system of old-age pensions paid for out of the national taxes. Let him remember at the same time that this system must be most intimately connected with and change the whole character of the Poor Law, and must accustom the whole population of England to build upon help derived from the State. Leading men of both parties, such as Mr. Chamberlain and the present prime minister, have expressed their sympathy, to use the mildest term, with a policy which, on the view of the best known among its advocates, must cost the country at least £17,000,000 a year. This innovation, moreover, is merely one of many. The trade unions, which are already powerful, are demanding not rights, but privileges, and their demand is likely to be granted.

In plain truth, collectivism or Socialism is advancing with rapid strides; its ideas, if not yet carried out in practice, are to a great extent conceded in theory. The victory, indeed, of free traders at the elections gives from one point of view a false impression, abroad at any rate, of the condition of sentiment in England. No sensible man, of course, unless he be a statesman pledged to some doctrine of fiscal reform, can doubt that the electors have by an immense majority condemned as decisively as it is possible any protectionist policy. In so far they have maintained the doctrine of Bentham, of Cobden, and of Bright; but let no one suppose that this condemnation results from adherence to the old school of Liberalism, whose members believed heart and soul in the sacredness of individual freedom and the wisdom of *laissez-faire*. An English elector of to-day will not vote for protectionist members because, naturally enough, he prefers the "Great Loaf" to the "Little Loaf," and dreads any return to a tax on corn; but in other respects the average elector has rejected the dogmas dear to the old Liberals. He assuredly demands State aid and State interference at home. It is not at all certain that he objects to protection against foreign competition with native industry. It is this latent affinity of Socialism to protection which gives more strength to Chamberlain and the new Birmingham school than they are supposed to possess by observers who note nothing but the triumph of the Liberal Party.

However this may be, socialistic ideas have at last obtained full, perhaps excessive, representation in Parliament. This fact is important, but hardly surprising; what excites astonishment is that, among the well-to-do classes, the prospect of revolutionary legislation and revolutionary administration apparently arouses neither enthusiasm nor opposition. It were curious to examine into the causes of this political apathy, but to trace it to its source is a task which certainly cannot be performed at the end of a letter which is already long enough. My only wish is to discharge at this moment the humbler duty of directing the attention of your readers to a singular political phenomenon. All the signs of the day point towards the imminence of attempts, at any rate, to effect fundamental changes in the social life of England. This new Radicalism, with its vague aspirations and only half-formulated creed, touches the foundations on which our whole system of commerce and of property rests. Yet no one is excited, no one as yet avows alarm. Is this the calm of good sense and sound judgment, or the apathy produced by the conviction, imbibed from an experience of, say, a century, that changes which seemed large and revolutionary in their day have never shaken and have hardly modified the basis of English society?

AN OBSERVER.

THE NEW ITALIAN MINISTRY.

FLORENCE, February 15, 1906.

Uninteresting as are the details of ministerial changes in Italy, the late crisis has awakened such unusual excitement throughout the country, and is so seriously commented on by the Continental press, that a succinct account may be welcome to the readers of the *Nation*. The advent of Sydney Sonnino as Premier and Minister of the Interior, in company with Ettore Sacchi, acknowledged leader of the Radical party, and Pantano, a fervent Mazzinian and still a Republican in theory, is a notable event. Eight years ago, Sacchi and Pantano were the most formidable and successful opponents of Sonnino, then the supporter of Pelloux and his coercionary measures growing out of the disorders that occurred in all the great centres from Milan to Bari, from divers causes—here, famine; there, crying oppression of the peasants by the owners of the soil; general discontent with taxation, everywhere heavy and generally unjustly assessed. States of siege, bloodshed in Milan and in other cities, the arrest and imprisonment of the editors of all Liberal papers, were the measures resorted to with the sanction of Sonnino. Coercive laws were introduced in Parliament, and then the Obstructionists, none more determined than Sacchi and Pantano, commenced operations and rendered all discussion impossible. On this, Pelloux obtained the royal decrees which converted the obnoxious bills into law. Again Sonnino stood by Pelloux, and by deeds and words proclaimed the necessity for the intervention of the Crown when it was possible for a minority to hinder the discussion of measures proposed by the Government and likely to receive the sanction of the majority. Naturally, Sonnino was at that time the best-hated man in Italy; all his real services to the country forgotten or reviled. Real services they were, for when he undertook, between the years 1892-96, to reorganize the finances of the country, Italy was on the verge of bankruptcy—the Government discredited by the bank scandals, commercial and industrial depression offering apparently no resource. Setting his shoulders to the wheel, he succeeded in lifting the State coach out of the rut; by economy to the bone and merciless taxation, he restored equilibrium between revenue and expenditure, and gained a signal victory. The country, as a whole, breathed freely; honor was saved, foreign nations applauded. But the taxpayers, bleeding at every pore, hated the hand that had saved their country at their individual cost; and when the hour of vengeance fell, they added their stones to the hailstorm that assailed the unpopular minister! "The skies might fall, but never more could Sydney Sonnino sit on the ministerial benches." Yet, there he is, Prime Minister, Home Minister, acclaimed as a necessity by the country, and feebly opposed by the supporters of Giolitti and Fortis.

The *modus vivendi* with Spain aroused the hostility of all the wine-producers, vendors, and consumers of the country. Fortis declared that he would stand or fall with his colleagues—that, if a hostile vote censured the three real negotiators of the treaty with Spain (Ferraris, Rava, and Tittoni), he would resign. They were censured, but some sixty-four of the hostile voters affirmed their confidence in the general policy of the Ministry, and Fortis, in an evil hour, allowed himself to be persuaded to attempt the re-formation of the Cabinet, well aware that, in losing the three above-mentioned colleagues, he parted with the only men of worth, and would be unable adequately to replace them. His evil genius was, of course, Giolitti, who had used Fortis only as a stop-gap, and who, though restored to "boisterous health," was not yet inclined to return to the helm, as railway affairs were in a worse plight than when he abandoned the Ministry. In fact, no one would join the second Fortis Ministry—no one of any note or value. On which, after a crisis of forty days, he presented himself to the House with seven new and three of the old ministers, including, astounding to relate, Tedesco as Minister of Public Works—Tedesco, who had muddled all from the beginning, reviled and insulted Fortis and Carcano, Minister of the Treasury; moreover, with no solution of the railway problem, and only the promise "that the Government would present a set of measures which would lead to rapid results, and would unhesitatingly face all possible responsibilities."

The scenes of the three days that followed explain the phenomenon of a Sonnino-Sacchi-Pantano Ministry, which is welcomed by the country with as much satisfaction as surprise. On the second day, Fortis attempted a feeble refutation of the arguments brought forward by the chiefs of the Opposition, and at the close challenged Sonnino, "who appears to be the commander-in-chief of these diverse oppositions [cries of yes! yes! yes! from all sides of the House], to expound his and their ideas. My opinions I will explain when I know yours." Sonnino, accepting the double challenge of Fortis and (on the previous day) of Turati, Reform Socialist, did unfold his views, and the House listened to his lucid speech with breathless attention. He reviewed the history of the last five years: reiterated promises of reform, not one fulfilled, and no shame manifest when delinquencies were brought home to the sinners. He dwelt, as an instance of the insincerity of the Fortis Ministry, on the postponement of the railway liquidation. He next depicted the anarchy and chaos of all the administrations of the State; then dwelt on the Government and local administration of the southern provinces, and narrated the electoral scandals of the late bye-elections at Amalfi and Gaeta, where the outrageous interference of the Government and its agents had brought the communes to the verge of revolt, ending in the fortunate defeat of the Ministerial candidate. "The imposing necessities of the southern provinces demand immediate solution; but this can never be attained until we have a clear

idea of the moral and social as well as economic condition of those provinces, which are closely associated with the general, if gradual, reform of our system of taxation." Of his criticisms of the general corruption, of the anarchical condition of elementary instruction and of education in general, of military disorganization, no résumé can give an idea; but his animadversions will be remembered when he puts his hand to the helm, as will also his exposition of the great public services of transportation and communication — railways, trams, post, telegraph, telephone, etc.

He referred briefly to the question of universal suffrage in answer to several questions as to his present opinion, saying that his views remained unchanged, and proposed that, as a step toward the social reforms which universal suffrage is supposed to be alone able to secure, some of the most urgent should be at once initiated, so as to hasten the economic, moral, and intellectual progress of the neediest classes, especially those of the southern provinces and of the islands, which at present are the least represented in the National Assembly. Clearly, he was not going to be drawn into the shadow of a pledge to bring the question within the pale of present urgencies, though theoretically he accepts the principle, and in 1881 made a remarkable speech in its favor. In ecclesiastical policy he maintained his invariable position: neither persecution, provocation, nor petty warfare; respect for all creeds and opinions; loyal observance of the law of guarantees, and at the same time rigorous and vigilant maintenance of all the rights of the State, which ought to be fully able to provide for its own aims and intentions in the fields of justice, morality, and culture. The State, in short, must be capable of carrying out its own policy, and yet allow dissentients to labor freely to attain theirs. This part of the discourse was not at all to the taste of the Radicals or Republicans, the Socialists remaining indifferent. "What," he concluded, "is required of a Government to-day is the immediate initiative of positive reforms, and a severely correct conduct in political and electoral struggles."

Only one Deputy rose to defend the Government. Giolitti's self-defence was weak and continually interrupted and contradicted. The only other speech tending to elucidate the why and wherefore of the presence of Radicals in the present Ministry was Sacchi's, who gave his reasons for voting against the Ministry, while admitting that a Cabinet "all of one color is at present impossible." He had no fear for liberty "conquered and defended by a people imbued with a sense of its rights and duties." It is the practical use of liberty that is now necessary, its application to all the wants and energies of national life, whereas during the government of Giolitti and Fortis lethargy and paralysis of all activity have prevailed. He objected to the methods of military administration, to the application of the enormous funds appropriated, to the utter neglect of the tax reforms promised and possible without disturbing the equilibrium of the budget. A Liberal Government ought to defend its civil rights, maintain the glorious tradition of the State that abolished religious corporations, prohibit the revival of ecclesiastical mortmain, and fortify secular instruction. In the Home Department he demanded the cessation of Governmental interference in administrative elections—the support given to one local party against another; the entire liberty of provincial and communal action, alluding to the late elections at Turin. Any ministry which should succeed in reviving or rather assisting national energies instead of neglecting and putting obstacles in their path, would be welcome to him and to the nation at large.

The House which had, at Sonnino's suggestion, allowed all the chief men to speak, now clamored for the question, and the Minister accepted Flamberti's motion that "The House approves the declarations of the Government and passes to the order of the day." Silence was maintained while the roll of the Deputies was called, with the result—yeas 188, nays 221; a clear majority of 33 votes against the Government. The Ministry resigned at once and the King accepted their resignations and called upon Sonnino to form a new one.

As the total 221 nays belong to all parties—the most numerous, Conservatives and Centre, amounting to not more than fifty—a coalition ministry was necessary. The difficulty in forming one lay in the choice of the representatives of the various non-Conservative parties, exclusive, of course, of the Socialists. Hence Sonnino's appeal, first to Sacchi then to Pantano, both of whom had refused several offers to form part of former ministries headed by Zanardelli, Giolitti, or Fortis. Why have they now accepted? Because they feel certain that, with Sonnino, they will be able to carry out some of the measures which they deem essential to national progress, neither of them imagining that they will be able to execute all or even a considerable part of their projects. They stand two Radicals in company with seven more or less Conservative colleagues. Guicciardini, descendant of the great historian, as Foreign Minister, will but follow the trend of his predecessors, maintain the Triple Alliance, and cultivate the cordial relations with France which already exist. Luzzatti, who has often figured as Minister of Finance, and now becomes Minister of the Treasury, is a stanch supporter of coöperation and popular banks. Paolo Boselli, another ex-Minister of Finance, as well as of Foreign Affairs and of Public Instruction, returns to this last unthankful office. Salandra, who returns to the Ministry of Finance, is recognized as capable and of high integrity; he was one of the stanchest opponents of the divorce bill which was so nearly carried by Zanardelli, and of which Sacchi is the zealous supporter. Carmine, well versed in finance and railway questions, is Minister of Public Works (may his good angel inspire him!). Alfred Baccelli, a young poet, chiefly known as his father's son, will have charge of Posts and Telegraphs. All these Liberal Conservatives are well known and are recognized even by their adversaries as men of worth, talent, culture, and experience.

There remain the Premier; Sacchi, the new Minister of Justice, and Pantano, the new Minister of Agriculture. Sonnino, born in 1847 of a very wealthy family, took his degree in law at Pisa in 1867, competed for and won a post in the Foreign Office, and was attached to the Italian legations of Madrid, Vienna, Berlin, and Versailles, observing and studying. He then returned to Italy, where he and his inseparable friend, Leopoldo Franchetti, devoted themselves to social questions, in company with Pasquale Villari, whose supreme merit is that of having been the pioneer in Italy of the study of distress and its remedies. The two volumes published by the friends after a diligent personal inspection of Sicily are treasures of accurate details, photographs of the awful conditions of the island, sapient suggestions of the remedies which the State, proprietors, and the people themselves might attempt with benefit. Sonnino and Franchetti published and edited a model weekly review, the *Rassegna Settimanale*, which had then no rival and has never had a successor. Assuredly both he and Carmine, the new Minister of Public Works, have assured themselves that the solution of the railway problem is possible; also that they are capable of performing what has now become a herculean task.

They will find no more active, ardent colleagues than the two Radicals, Sacchi and Pantano. Ettore Sacchi, fifty-seven years of age, entered the House in 1882 and enrolled himself under the banners of Bertani and Cavallotti, but, though inclined to the Republican faith, he has gradually grown to believe that all necessary reforms and measures are attainable under monarchy if its administrators are honest, active, and capable. His ideas of social and economic reforms are by no means inferior to those of Sonnino; and the fact that he has refused to enter former and so-called Liberal cabinets because he did not see his way clear to get in the thin end of the wedge, and that he did accept the offer made at once by the new Premier, proves that he believes in Sonnino's intentions and possibilities. The demand of some of his confrères that he should at once press the divorce question on the Cabinet is absurd. A coalition ministry must work out the questions on which they agree to agree, leaving for the time being those on which they differ.

The same remarks apply to Edward Pantano, whose acceptance of office has astonished many and utterly scandalized the holders of antediluvian prejudices who still survive in Italy. Born in 1843, he took his degree as surgeon and physician, but at once devoted himself to the study of sociology, in which he is an acknowledged proficient. A Garibaldian on the Volturno, he also followed the Duce in his pilgrimage through Sicily to the "bitter mount," where the hero's blood, shed by the King to whom he had given Sicily and Naples, so revolted his whole nature that during that King's life the very name of monarchy was repugnant to him. A believer in Mazzini and his doctrines Pantano was and is, but the absurdities and pretensions of the Republican party often disgusted him. Still, for liberty he always fought to the last ditch. In 1898 he and Sonnino fought as man to man. But, the fight over and victory won, Pantano returned to his garret study and elaborated his projects for emigration, taking part in all the discussions on agricultural and economic questions, showing real competency in tariff matters. Often selected as reporter on commercial and industrial questions, he was chosen to regulate several negotia-

tions with Switzerland and Austria. Some five years since, the Republicans at the congress of Ancona carried some absurd rules for the conduct of electors and elected, on which he quietly but publicly withdrew from the associatiou and from all official contact with his party. Ousted from his old college of Terni in 1904, chiefly through the hostility of his late comrades, he was elected for Giarre in his native Sicily. Bent on the passage of certaiu pet measures on emigration and other financial and social measures, he, who had refused all former offers, accepted after one night's reflection the invitation made by Sonnino in person at his beside, as he was ill.

The House is to be reopened on the first of March. Meanwhile, Sonnino has given orders for the cessation of the sequestration of telegrams; Sacchi has ordered the authorities to sequestrate no more newspapers save for violation of actual law, and never unless the cases are followed up by immediate trial. Six millions have been added to the ten already voted for the urgent necessities of Calabria.

J. W. M.

MADAME DE PRIE.

PARIS, February 17, 1906.

The history of the Regency which followed the reign of Louis XIV. will always be read in the Memoirs of Saint-Simon. There are no historical documents of equal importance on the Regency which followed the sudden death of the Duke d'Orléans, the Regent. At seven o'clock in the evening the Duke was at Versailles; he had just received a visit from the Duchess de Phalarso and the Marquise de Prie, but they had hardly entered the room when he called for help. A moment afterwards he fell, and he died at eight o'clock without having recovered consciousness. The young King was only thirteen years old. He had, on the advice of his preceptor, the Bishop of Fréjus, chosen the Duke de Bourbon, commonly called Monsieur le Duc, as his prime minister. He conferred the Regency immediately on the Duke de Bourbon. The Venetian ambassador wrote to his Government:

"The Duke de Bourbon loses no time in assuring himself of authority. He has laid hold on all the papers of the Regent and received the compliments of the ministers. I opine that this prince has not the talent or fertility of intrigue of the Duke d'Orléans. . . . If something is to be feared from this prince, it is his too condescending friendship for the Marquise de Prie, a lady of quality, but intriguing and grasping, who for three or four days has not left him for an instant and advises him on all matters."

This Madame de Prie has just been made the subject of a biography by H. Thirion. As she for some years enjoyed extraordinary influence with Monsieur le Duc, it may be said that her life belongs to history. She has not been treated indulgently by the historians, but all are unanimous on the chapter of her beauty. President Hénault says of her: "There could have been nothing prettier at the time she joined her husband, the King's ambassador at Turin." Saint-Simon says of her: "Madame de Prie was handsome, shapely, possessing an indefinable charm, of an extremely cultivated mind, with memory and the wisdom not to show it."

The Marchioness de Prie was not of noble origin. The Rioults were among the financiers who added the name of some estate to their family name. Her mother, Agnes Rioult, was the daughter of a receiver of finances in Poitou. She married Berthelot de Pléncuf, a powder-director of France, a financier who was already a widower and was thirty-five years old. As army contractor he had increased a fortune already very large. Madame de Pléneuf became one of the queens of Paris, and was notorious for her light conduct. Her daughter at the age of fifteen was married to the Marquis de Prie, colonel of a regiment and ambassador at the Court of Turin. He was allied to the first families of the kingdom. The Marquis had no fortune, and in 1717 he fouud himself in difficulties and remained alone in Turin. Madame de Prie returned to Paris without him. She had learned much during the five years she had spent in Italy; she had become acquainted with many diplomatic intrigues. She had, according to her husband's instructions, to pay court to the Regent, to the Abbé Dubois, to Torcy, to Rohan, to all the powers of the day. She made accidentally the acquaintance of the Duke de Bourbon at a fancy ball at the Opéra—at least, such was the version of the time; what is certain is that he immediately fell under her sway, and remained so to the end. She flattered his artistic tastes; she had herself painted for him by Van Loo; she patronized Rosalba. She was fond of Correggio, and induced the Duke to have good copies made of the famous pictures, "Io," Danaë," "Leda." She was a good singer, and propagated the taste for Italian music; she founded concerts; she helped the Duke in his embellishment of Chantilly. The Duke de Bourbon sunk a part of his gains at the time of the South Sea Bubble in Chantilly; he constructed the palatial stables which are one of the features of this princely domain. Madame de Prie was the soul of the great fêtes which were given at Chantilly.

Madame de Prie was of an ambitious nature; she was not occupied solely with trifles and amusements. She understood that there was something strange in her fortune; she was the daughter of a somewhat despised financier and of a woman without reputation; she had many enemies—those of her own family and those of the Duke de Bourbon; her own mother had taken a place among her bitterest adversaries. Her strength lay in the weakness of the Duke de Bourbon. The death of the Duchess, which took place in March, 1720, made her task easier; but she had to conquer the neutrality of the Dowager Duchess, a daughter of Louis XIV. and of Madame de Montespan. This Duchess, according to Walpole, did not cease to entertain a great aversion for the favorite of Monsieur le Duc, but for the public eye they preserved the semblance of friendship. The brothers and sisters of Monsieur le Duc were not of much account. After the death of the Duke d'Orléans, when the Duke de Bourbon seized the power, the first object of Madame de Prie was to separate the young King from his preceptor, Fleury, the Bishop of Fréjus. Louis XV. wept copiously when the separation took place, but he was soon afterwards taken to Chantilly, where he remaincd about two months.

"To gain the good graces of the young monarch, there was nothing to do but to exploit his love of hunting. Nobody could do this better than Monsieur le Duc. His forests at Chantilly and Hallatte abounded in big game, which was beginning to be scarce at Versailles. . . . Monsieur le Duc's packs had a quasi-European reputation. He was himself one of the first huntsmen of the kingdom. In proposing to the young King to devote two months to Chantilly, he satisfied his most ardent desires."

Meanwhile, the enemies of Monsieur le Duc, the ex-minister Le Blanc, Belle-Isle, and their friends, were shut up in the Bastille, and their trials began. We need not go into the details of this. Monsieur le Duc and Madame did not, however, feel quite assured of their power; they were still afraid of Fleury's influence, and set over against it the Marshal of Villeroy, who was eighty-three years old and was living in retirement in his Lyons domain. Villeroy's return to favor was of very short duration. Madame de Prie had all the ministers in hand—Maurepas, La Vrillière, Breteuil; she centralized everything, had two secretaries, and treated herself all the more arduous questions. She was the fountain of favor, gave to her husband the government of Brittany, sent Richelieu as ambassador to Vienna; she made all the lists for the King's journeys, especially for the visits to Chantilly.

The time came when a wife was to be found for the Kiug. It was resolved between Monsieur le Duc, Madame de Prie, Villars, and a very small number of friends that the young Infanta, who was destined at first to become the wife of Louis XV., should be sent back to Madrid. The Spanish marriage had been the Regent's project; it had been accepted by Philip V. in the secret hope of bringing himself nearer to the throne of France. The Duc du Maine, the Count de Toulouse, were in favor of it, out of hostility to the house of Condé. The situation of the young Infanta was ill defined; she had been enthusiastically received in 1723, a household had been formed for her; but she had no regular, recognized title to the hand of the King. Monsieur le Duc was the enemy of the House of Orléans, and consequently disliked the Spauish marriage; he looked in vain in Germany, in England, for a princess; in the end his choice fell on Maria Leczinska, whose dethroned father was living quietly in Lorraine. Madame de Prie did not think her dangerous to her influence. On the 27th of May, 1725, the King announced publicly after dinner his marriage with the Princess Maria, almost unknown at the time. Madame de Prie took care to be represented to her as the instrument of her fortune, the devoted friend in whom she could have perfect confidence, and who would help her in all her difficulties. She named all the ladies of the Queen, herself at the head of them, Mesdames de Nesle, de Ruppelmonde, de Matignon, the Duchesses of Egmont and of Villars. Madame de Mailly was chosen for the important post of *dame d'atours*. Madame de Prie accompauied Maria Leczinska in her triumphant journey through Metz, Verdun, Sainte-Ménehould, Châlons, and Foutainebleau.

The King and Queen of Spain were highly offended at the treatment accorded the Infanta; they had been brutally offended in their hopes and their pride. All the enemies of Madame de Prie and of Monsieur le Duc took advantage of it; the people re-

gretted the Infanta and did not approve of the marriage of the King with a penniless Polish noblewoman. Monsieur le Duc was unpopular, the treasury was empty. He was accused of speculating and enriching Madame de Prie. His enormous fortune might have placed him above the accusations of his enemies; it was not the same for her and her friends, the Brothers Pâris, the great financiers of the time. M. Thirion, however, takes her part, and tries to exonerate her.

The Duke decided to abandon the ministry. He left Versailles and went to Chantilly, where Madame de Prie followed him, as well as the Dowager Duchess of Bourbon. He received there a letter from Fleury, the Bishop of Fréjus, who had returned to favor, informing him that the King had taken the resolution to govern "by himself." Madame de Prie's position at Chantilly became untenable, as the Dowager Duchess would not see her. The disgrace of the Duke was complete; his mother accused him of having lost every thing by following the advice of Madame de Prie—"une gueuse," says Barbier in his Journal, "to whom she had taken the liberty to say *ses petites vérités*." The favorite left Chantilly and returned to Paris; by order of the King, she was exiled to the château of Courbépine, near Bernay. The Duke de Bourbon was ordered to remain at Chantilly. Madame de Prie did not survive her downfall a single year; she died at the age of twenty-eight years. Some people would have it that she poisoned herself slowly. The Venetian Ambassador, Morisini, announced to the Senate of Venice the death of Madame de Prie "nel fior di gioventù e di bellezza." M. Thirion does not seem to us to have exculpated his heroine from the accusation brought against her; she was really an adventuress. She was intelligent, clever, and had the perilous advantage of ruling for several years a prince of a feeble mind, who had nothing left in him of the qualities of his illustrious ancestors.

Correspondence.

MR. GOLDWIN SMITH'S VIEWS ON IRELAND.

To the Editor of The Nation:

Sir: In your review of my 'Irish History and the Irish Question,' you say that my views are "markedly anti-Irish and anti-Catholic." You do me a great wrong.

My first essay, 'Irish History and Irish Character,' to which the present is a sequel, was written specially in defence of Irish character, showing that its supposed faults were not native, but the effects of a calamitous history. That essay, I am assured, had its effect at the time on the tone of the discussion, even in the House of Commons. This second essay has a not less friendly object, though, in common with Bright and many other hearty friends of justice to Ireland, I dissented, in the interest of both kingdoms, from a policy which would break their union.

To the conduct of the Irish priesthood in Ireland's dark hour I have tried to do full justice; and I believe you would hardly find stronger language than that which I have used in condemning the Penal Code.

To the aims of Philip II., Jesuitism, the Inquisition, and the *dragonnades* I have no doubt shown myself markedly opposed. To Catholics, in any sense save that of difference of conviction, I never have. Nobody could more heartily advocate Disestablishment than I did. I have numbered among Catholics some of my most valued friends, among them a principal of Maynooth.

Is a writer disqualified from dealing with the Irish question because, though he has closely followed the discussion and been in communication with those engaged, he has not been constantly resident in Ireland? Is not the question British as well as Irish? Slips on minor points there might be. To guard against these, my manuscript was sent to Ireland for revision.

Yours faithfully,

Goldwin Smith.

Toronto, February 26, 1906.

[In self-extenuation we may say that we adopted a similar precaution, and that we procured our review from an Irish Protestant in Ireland.—Ed. Nation.]

ENGLAND'S LABOR PROBLEM.

To the Editor of The Nation:

Sir: I trust you will allow me a few words of protest against the exceedingly one-sided article on "England's Peril" by your London correspondent, "An Observer" (issue of February 8). The "pauperization of the poor" is not the great danger of England. Pauperization is always a great evil, but a far greater and deeper-rooted evil than a temporary more or less of pauperism is the chief underlying cause of pauperism, a cause which is also largely responsible for many other evils often treated as independent moral phenomena—as intemperance, the shirking of hard work, and the low grade of civilization among our working classes—viz., the inequitable distribution of wealth, of the rewards of social service. Do American readers know how large a proportion of our working people—not of the "unemployable" class, but decent, hard-working men, without whose services society could not go on for a day—have to provide for a family, and for many "rainy days," on eighteen to twenty-five shillings a week, often with several weeks' deficit through enforced unemployment? Is it not a mockery, a pharisaism, to harp upon the want of that "self-respect," that "energy and independence," which will shun the contamination of poor relief, in men—and their wives—who, underfed and ill-housed, find no place in their domestic budget for clothes decent enough to visit any public assembly on Sunday but the public-house, or for the expense of giving to their children any better influences than those of the gutter? Yet this independence is often found among them, even when other civic virtues are starved out. Is the efficient and willing and sober American workman produced under conditions like these? The English workman is intrinsically in no respect inferior to him, as his American employers testify.

If Americans wish to know the truth about English social conditions—or those under which pauperism is bred—let them read the sober and careful statements of investigators like Mr. Alfred Booth or Mr. Rowntree, let them read Mr. Chiozza Money's recent work on 'Riches and Poverty,' or Mr. J. A. Hobson's 'Problem of the Unemployed,' or any one of a number of other books lately written, not by Socialists or labor partisans, but by educated economists and sociologists. They will find a growing consensus of opinion that the problem of problems, that which includes in its larger scope almost all other pressing social problems, is just this: how by gradual reform so to modify and adapt our social organization, including the organization of industry, as to ensure to all who are born into our citizenship the training and opportunity to become self-supporting and independent, as civilized and self-respecting men, by efficient social service. That large numbers are at present without them, through no original fault of their own, is patent to all who have eyes to see and a heart to understand.

Most social factors are both causes and effects, and he is the wise man who can lay his fingers on the true causes. And the moral causes of pauperism are themselves to a large extent the result of removable economic causes. I admit that some of the remedies proposed for newly realized and pressing evils are but doubtful palliatives, often fraught with risk of even worse evils, at least for a time. But I have not the heart to raise the voice of the economist or the moralist—as it no doubt should be raised—without at the same time emphasizing the urgent necessity for that disinterested and energetic social reform which is the only effectual remedy. And, happily, there never was more serious thought and earnest effort in this direction than at present. We are living under new and still changing conditions, and are beginning to realize that an active and intelligent social evolution is the only safeguard against an eventual and truly perilous revolution.

Yours truly, H. J. Wolstenholme.

Christ's College, Cambridge,
February 22, 1906.

SWIFTIANA.

To the Editor of The Nation:

Sir: The Very Rev. J. H. Bernard, Dean of St. Patrick's, delivered here in Dublin, a few days ago, a brilliant lecture on Jonathan Swift. In the course of it he mentioned two facts connected with the great Dean of St. Patrick's previously unknown to me, and a third previously unremarked. It may be of interest to some of your readers to note them.

The weak point in the evidence in favor of Swift's marriage with Esther Johnson has hitherto been that there was no written statement concerning it until very many years after his death in 1745. A few months ago, amongst Archbishop Wake's letters preserved in the Library of Christ Church, Oxford, one was found to the Archbishop from Dr. Evans, Bishop of Meath. It is dated July 27, 1723. In it he refers to Vanessa's discovery of the Dean's marriage to Stella, and Vanessa's death. This contemporary reference strengthens previous evidence of a marriage, which no one supposes was ever more than one by word of mouth.

Until last November it was presumed the name of Lemuel Gulliver, "author" of the

'Travels,' was an invention of Swift's. There has been discovered in the muniment room of Westminster Abbey a bundle of law papers relating to an action during Swift's lifetime by one Lemuel Gulliver of Westminster, against a certain Peter Swift of Longdon in Worcestershire. Longdon is less than twenty miles from Goodwich, of which parish Swift's grandfather was vicar.

Swift's guess concerning the planet Mars is very curious. In 'Gulliver's Travels,' *Laputa*, Chapter III., occurs the following passage:

"They [the Laputans] have likewise discovered two lesser stars, or satellites, which revolve about Mars, whereof the innermost is distant from the centre of the primary planet exactly three of his diameters, and the outermost five; the former revolves in the space of ten hours, and the latter in twenty-one and a half."

This was written in 1726. The existence of two satellites to Mars was not discovered until 1877, by an observer at Washington. Swift's imagination as to the periods of their revolution is strangely near the truth —10 and 21.5 hours; they revolve in 7.5 and 30 hours. His guess as to their distance from the centre of Mars is not so near—3 and 5 of the diameters of Mars. Their actual distance is 1.3 and 3.4 of the planet's diameter.—Very truly, ALFRED WEBB.

DUBLIN, February 20, 1900.

AN INNOVATION IN HARVARD ENTRANCE REQUIREMENTS.

TO THE EDITOR OF THE NATION:

SIR: An interesting change in the matter of the admission examinations has just been announced at Harvard. In future, instead of consolidating these at the close of the last two years before entrance, and granting no credit unless six or eight points are made, candidates will be free to take their examinations when they please, and will be credited with them as they are passed, regardless of the number. A candidate may then enter whenever the requisite points are registered in his favor.

This new departure will permit an intending Harvard student to be examined for college in a subject in the same year in which the subject is completed in the secondary school, and will avoid the necessity of warming over or keeping warm subjects in which lingering destroys interest, produces mental nausea, and thus prohibits a genuine advance. Besides, by stimulating an early decision in selecting a college, and obviating the prolonged final "cram," it will tend to give greater continuity and purpose to education. Hitherto, boys and parents have been rather encouraged to postpone a decision, because, as they see it, nothing is lost by waiting; and when at last a decision is made and quick results are needed, there are effective agencies in abundance through which they can be obtained. The boy who henceforth elects to go to Harvard will, if he makes up his mind betimes, get his reward in being allowed to carry forward his work naturally without congestion at the close.

An objection may be urged on the ground of the importance of the final review in mathematics, of which the elements need to be fresh in mind, in case the subject is included in the boy's college course; but this is a detail which the self-interest of the secondary schools may be trusted to provide for.

The full practical benefit of the improvement cannot, however, be realized until other institutions adopt the same plan. Secondary schools do not devote themselves to preparation for any one institution; every class contains boys destined for Harvard, Yale, Princeton, etc., side by side, and the schools are for the most part organized on the class basis. The requirements of the less enlightened institutions therefore determine the curriculum. If Columbia and Bryn Mawr insist on concentrating the examinations in the final two years or less, then the secondary schools face the alternative of chaos or congestion. A pretty situation may arise a few years hence when a boy or a girl with a Harvard entrance certificate applies for admission to some college that has hitherto gladly accepted this evidence of fitness: will inquiry be made as to the date when the respective credits were earned, and reëxamination in part or whole required? There is no telling; in the matter of college entrance you must never call a thing impossible just because it is irrational or absurd. At Vassar a ruling was recently made that a girl who may have passed the matriculation examinations of Johns Hopkins must demonstrate her fitness anew by undergoing the tests as applied by the college entrance examination board!

The Harvard move interests me, however, especially in its ultimate possibilities, for it may betoken a tendency on the part of the colleges to get off the neck of the secondary schools. The hopelessness of genuine progress lies, to my thinking, in the deadly fixity which the colleges have imposed on preparatory training. To be quite outspoken, I hold that a committee of college professors is not a proper body to exercise unlimited authority over secondary education. They are, as a rule, men of academic prepossessions and limitations, who do not, for the most part, come in contact with boys at all until their wretched prescriptions have materially harmed them; and, even then, their contact is largely at long range, through certain imperfect and precarious "feelers" called Instructors or Assistants. Fixity of the kind now insisted on is an effectual bar to progress; the situation has crystallized far too quickly. In recent years there has been a genuine and unmistakable improvement in elementary education: would it have occurred, if, to return to my cervical figure, a committee of secondary schoolmen had forged a tight collar for the submissive elementary school neck?

Let it not be supposed that I urge mutual independence of the several educational units; just the reverse! Our need is for intimate, vital, organic connection. But the so-called coöperation that we now have begins only after the colleges have prejudged the whole situation!

ABRAHAM FLEXNER.

17 BUCKINGHAM STREET, CAMBRIDGE, MASS., March 3, 1906.

POULTRY-RAISING, ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: The prescription for success with poultry, given by Mr. Robinson Smith in the last issue of the *Nation*, is, "Do the work yourself and take infinite pains." Is not that a rule for success applicable to any and every business?

As a side issue and as a diversion, poultry-keeping has been a study with me for the last eight years. The old adage about counting chickens before they are hatched seems to be as applicable nowadays as it was presumably in other days. A great many people, ignorant of the work, get the idea that, having kept a few hens successfully, they can keep a larger number with correspondingly larger profits. This is a mistake, and I have seen at least a dozen instances where city people have bought a small piece of land in the country, have invested money lavishly (on a small scale), and have been much surprised to find that their poultry did not pay.

Poultry can be made to pay, but in order to do this the owner must have a peculiar aptitude for the business, and must devote his personal, unremitting attention to it. He must also be a very careful student of the conditions under which he works: nearness to market, demands of that market, appropriate season for putting his wares on the market, advertising, exhibiting at shows, economy in feeding, and utilization of waste products. A hawk, a weasel, a neglected case of roup, a colony of rats, a smoking brooder lamp, or a thief at night may ruin a season's work. Somebody—an expert—must be on the premises all the time. It is true that the owner can hire a poultryman to take care of the plant, but his wages and keep will cost so much that the plant must be pretty large to make it a profitable investment. In order to pass on the qualifications of a good poultryman, the owner must be an expert himself. If the employee should happen to leave in a "huff"—and such things do occur —the owner must be capable of running the concern himself, or suffer great loss.

The ordinary hen will lay about $2 worth of eggs a year, and it will cost about one dollar a year to feed her. When her season of usefulness as a layer is past, she may be put on the market, and she will fetch about enough to pay for her keep from hatch to laying period—about one year with most breeds. Properly to house and yard 100 hens will involve an original outlay of about $100. This does not include the cost of breeders and incubators.

It would seem, then, that 100 hens, one year old, should yield a profit of $100, and 1,000 hens should yield a profit of $1,000, and 10,000 hens should bring in $10,000, and so on. But the fallacy lies in applying mathematics to hens. In mathematics there are no accidents, all the conditions of the problem are known and accounted for; while poultry-keeping is full of accidents and conditions which are constantly arising and which cannot be foreseen or calculated on in advance. Application of mathematics to keeping hens has caused many a broken heart and broken bank account. Poultry can be kept profitably and on a large scale by an adept in the art, who is willing to devote his time vigilantly and unremittingly to that business. The reason why so many people fail to make poultry profitable is because they don't know how and because they have not the patience.

On the other hand, perhaps my experience with a small flock of about fifty birds may be interesting. I selected one breed and bought the best that money could buy. I laid out about $300 for house, yards, incubators, brooders, etc. I kept an accurate account of receipts and expenditures, not counting, however, chickens for table use or eggs consumed by the family of five persons. At the end of three years the flock had repaid me for my original expenditure. During the following four years they gave me a profit of about $500 in all.

Later, I sold the place, shipped my flock to a friend in the East, and stored my brooders and incubators. But the points for consideration are, in my opinion, that I did all the work myself; I selected one breed and exhibited at shows successfully and advertised. I sold eggs for hatching at $4.00 per setting, and I sold single birds as high as $35.

I took the thing up as a hobby and as an amusement, and also for the improvement of my health in outdoor work. The hobby paid me at the rate of about a hundred dollars a year; it furnished me an agreeable and healthful diversion from other work of a different character. To any person having a portion of the day at his disposal, who loves animals and outdoor life, I can confidently recommend poultry-keeping—on a small scale.

E. L. C. Morse.

Chicago, March 3, 1906.

A LAPSE CORRECTED.

To the Editor of The Nation:

Sir: In your review of my 'Washington and the West' (containing Washington's Diary of 1784), printed in your issue of November 30, 1905, the reviewer stated: "The diary was printed by Sparks, but not in full." I have a letter from the reviewer in question which reads: "Sparks did not publish it, and I was therefore at fault in so asserting. It was a case where I depended upon memory, and my memory misled me. I owe you an apology."

I think you owe it to all concerned to give this statement as wide a circulation as you gave the error. Had the remark been true, there would have been little reason for the book.

Faithfully yours,

Archer B. Hulbert.

Marietta, O., February 26, 1906.

Notes.

Fox, Duffield & Co. have in press 'The Book of Tea,' an interpretation of Japanese life by Okakura-Kakuzo, and 'Reminiscences of My Childhood and Youth,' by Georg Brandes.

From Macmillan we are to have 'The Blackmore Country,' illustrated, by F. J. Snell; and a new edition, with supplementary essays, of E. G. Hardy's 'Christianity and the Roman Government,' under the title, 'Studies in Roman History.'

Messrs. Putnam have in preparation 'Studies in Socialism,' by Jean Jaurès; 'A Short History of Freethought, Ancient and Modern,' by John M. Robertson; and 'Notes on the History and Political Institutions of the Old World,' by Edward Preissig.

'Personal Recollections of Johannes Brahms,' by George Henschel; 'Alterations and Adaptations of Shakspere,' by Frederick W. Kilbourne, and 'Our Common Wild-flowers,' by Alice M. Dowd, are announced by Richard G. Badger, Boston.

The Oxford University Press (H. Frowde) has nearly ready Matthew Arnold's 'Merope,' edited by J. Churton Collins; to which is appended R. Whitelaw's translation of the "Electra" of Sophocles. If favorably received, this popularizing volume will be followed by others "containing some leading Greek tragedy in an acknowledged masterpiece of translatiou, edited in the same manner."

By inadvertence, in noticing last week the two latest issues of the Newnes "Art Library," we misnamed the American publishers, who are Messrs. Frederick Warne & Co.

The Graphical Society, which solicits subscribers at 30 marks annually, will reprint woodcuts and engravings, small books with their texts, especially blockbooks and the oldest illustrated books, series of sheets having historical or artistic connection, and works of individual masters. Each separate publication will appear in book form and be complete in itself. The editorial committee is made up of such connoisseurs as Dr. Max Lehrs, Dr. Max J. Friedländer, and Dr. Paul Kristeller. The honorary committee also abounds in the names of European museum directors and patrons of art. Evidently the new society starts under learned and distinguished auspices. For immediate publication are proposed, among many titles: 'Biblia Pauperum,' the unique Heidelberg example of this fine blockbook; the Lübeck Dance of Death, 1498 (also unique at Nürnberg); the works of Giulio and Domenico Campagnola; Boccaccio's 'Ninfale Fiesolano,' Florence, fifteenth century; the oldest illustrations of the 'Trionfi' of Petrarch, on wood and on copper; Beham's Bible woodcuts, and Adam Elsheimer's etchings. The Society's business will be transacted through the publishing firm of Bruno Cassirer, Derfflinger Strasse 16, Berlin, W., to whom application for membership and subscriptions should be sent by April 15, proximo.

The paintings of old masters in possession of the German Emperor and King of Prussia are to be published for the first time under the direction of Wilhelm Bode, Max J. Friedländer, and Paul Seidel (Berlin: Richard Bong; New York: Lemcke & Büchner). There will be 72 large photogravures, 130 illustrations in the text, and 200 pages of letterpress. The issue will be in twenty-four parts at five marks each.

Another one-volume edition of 'The Poetical Works of Lord Byron' (Scribners) follows close upon that in the "Cambridge Edition" (Houghton, Mifflin & Co.), edited by Paul E. More. The later, "the only complete and copyright text in one volume," proceeds from Ernest Hartley Coleridge, and differs from the American in arrangement, as in some other particulars, one being the index to first lines, which is alphabetized for *A*, *I*, and *O* in a manner somewhat old-fashioned, and makes an indexical comparison for fulness between the two collections by no means simple. The American index of titles, likewise, must be collated with Mr. Coleridge's classified tablo of contents. Finally, the newer letterpress is rather faintly, though very clearly, printed. The English type page is slightly shorter than the American, as well as narrower, but the number of folios is nearly identical; as the English margins are larger, it follows that the type employed is slightly smaller. The text is authoritative.

It seemed timely, amid the great free-trade electoral campaign just closed across the water, to bring out on behalf of the losing side a new edition of Disraeli's political biography of Lord George Bentinck (London: Constable; New York: Dutton). It opens on the eve of the repeal of the Corn Laws, of which it gives the Tory view. Bentinck forestalled Chamberlain in thinking that England's commercial policy should be not free trade, but reciprocity. Mr. Charles Whibley, in his introduction, now looks to see Chamberlain "play the part then played by Lord George Bentinck. . . . He too will fight the battle of the manufacturers and the Colonial farmers. . . . Once again the Free Traders will rest their case not upon facts, but upon sentiments. Once again we shall hear an echo of Disraeli's saying: 'Protection is not a principle, it is an expedient.'" Mr. Whibley further quotes a speech of Lord John Manners in 1846 presenting the Chamberlain scheme, and congratulates the present Duke of Rutland on witnessing "the approaching triumph of a cause which has been neglected for more than half a century." This prophecy is now a little blighted.

Mr. S. M. Crothers's 'The Pardoner's Wallet' (Houghton, Mifflin & Co.) is a collection of semi-humorous moralizing essays. The title is derived, as the reader will surmise, from Chaucer's "gentil Pardoner," who, in the fourteenth century, rode straight from the court of Rome, "his walet . . . in his lappe Bretful of pardoun." A title that needs a note of explanation is, in our eyes, one of the minor unpardonable sins. Even after Mr. Crothers has explained that he intends to offer "suggestions concerning things pardonable," his essays cannot all be said to have any relation to their general title. Those on Saint Francis and on Hawthorne, for instance, would be in place in any volume of serious papers. All the essays are well written, and the pardonable sins, the prejudices, the unseasonable virtues, the fallacies of the peacemakers, who, according to Mr. Crothers, are always middle-aged or elderly and forget the ever recurrent militant temper of youth, are treated with a light hand. This sort of essay is not at all easy to write. Few readers can stand more than a few pages of humorous moralizing; and to turn out a perfect example of this kind of writing, one must have the genius and temperament of a Stevenson. But Mr. Crothers is always readable, and peculiarly ready with those apt illustrations which are usually the most attractive ingredient in this sort of literature.

Joel Benton has gathered together, under the title of 'Persons and Places' (The Broadway Publishing Co.), a group of short essays, several of which have been in print before, in the *Bookman*, the *Unitarian Review*, and other periodicals. Most of the papers are not of serious importance, but Mr. Benton has evidently devoted much

care to the one which deals with the poetry of William Cullen Bryant. The hurden of his thought is a complaint that Bryant dwelt excessively on the theme of death. "The question which ohtrudes itself is whether so much of the charnel-house at all times and seasons is not a serious defect in poetry. . . . Will the nohlest thought, even, and the perfection of rhythm and rhyme, make the atmosphere of the graveyard permanently dear and popular?" Unquestionably Bryant did not write for all classes of readers, and in all moods. He can sing "Omnes eodem cogimur" with Horace, but the playful hadinage with Lyde or Lydia, Pyrrha or Chloe, did not fall within his chosen field, and he had a right to choose his field. The question for the critic is his skill in cultivating it after it was once chosen, and, therefore, we think that the general tone of Mr. Benton's paper does the poet injustice. In large measure, however, he counteracts his own criticism with the question, "Who has not, indeed, heen deeply indebted to him, if he reads poetry at all, for an immense contrihution to his pleasure?" The gloom and odor of the charnel-house cannot be a peculiarly distinctive feature of any hody of poetry of which such a question can appropriately he asked. Two other papers are marked hy a very kindly feeling towards Thoreau, an attitude which we take to be far more prevalent than the author seems to suppose.

Miss M. Louise Greene's 'Development of Religious Liherty in Connecticut' (Houghton, Mifflin & Co.) is a welcome and creditahle addition to the small list of valuahle works on American ecclesiastical history. In so far as it seeks to show the connection between religious movements in Connecticut and similar movements elsewhere, particularly in Massachusetts, the work is constructed on hroad lines, though we think that the development of dissent in England and the transplantation of it to Holland and America receive rather more than proportionate notice. The chief hones of contention in Connecticut were, of course, the Half-way Covenant and the Sayhrook Platform; and to the development of these great statements, and of the controversies which centred round them, Miss Greene pays detailed and patient attention. One marvels, indeed, at the structure of injustice and oppression which the oligarchy of the orthodox huilt up and long maintalned; at the harsh and cruel treatment of dissenters, from Episcopalians to Quakers and Baptists; and at the slow spread of toleration. We must confess to not findlng Miss Greene's treatment everywhere sympathetic: she does not always make one feel that the controversies which she is tracing were really worth while, or enahle us to understand why the men who engaged in them thought them, as they did, so supremely important. Her account of the "Great Awakening," for example, is distinctly cold, and that of the work and influence of Jonathan Edwards a bit superficial. On the other hand, Miss Greene is neither partial nor hostlle, and her work, if it errs somewhat in feeling, is well stored with facts. The bihliography lists the principal authorities, including much contemporary material hitherto little used. It is rather inconvenient, however, to have the references to authoritles massed at the end of the volume, with only those classed as "explanatory" given at the foot of the page.

'A Canadian Girl in South Africa' (Toronto: W. Briggs), by E. Maud Graham, is a hright and interesting account of life in the Orange River Colony during what may be termed the reconstruction period. The author was one of the forty Canadian ladies who volunteered in 1902 to teach the children in the Concentration Camps. Her first station was at Norval's Pont, where there were some thirteen hundred children, all of whom but the hahies went to school. Her pictures of these Boer children, their hrightness and affection for their teachers, are very attractive, while the account of the teachers' relations with the parents shows that, during the year after the close of the war, a kindly feeling hetween Dutch and English prevailed. The divisions of the present day are largely due, in her opinion, to the unavoidahle delays in paying the war claims, the inefficiency of many of the English officials, and the educational crusade of the *predikants*, disgruntled hecause of the gradual stoppage of the Government grant for their support. The teachers themselves were instrumental in promoting and deepening this good feeling through their games and entertainments; the hostile factions at Kroonstad, for instance, where Miss Graham closed her service of twenty-five months, were hrought together hy means of field hockey contests. In the closing chapters, she treats hriefly of Kafirs and lahor, education and farming. Her style is simple and unaffected, and the narrative is hrightened with frequent humorous touches. Many reproductions of the author's photographs add to the attractiveness of the volume.

Volume XVI. of the "Harvard Studies in Classical Philology" has two papers of rather more than the usual importance. The first of these, hy Chandler R. Post, deals with the dramatic art of Æschylus, and has won for its author the distinction of the Charles Eliot Norton fellowship in Greek studies. While the purpose of the thesis is to trace the development of the dramatic art of Æschylus in the strictly technical sense of the term, it is still a paper which any intelligent student of the drama from a more purely literary point of view may read with ease and profit, even though he may not grasp the meaning of the few Greek lines interspersed here and there. The paper might well have sought a more popular channel of puhlication. The second of the papers referred to is a very searching discussion of the nature and origin of Indo-European inflection. No one hut the specialist would he ahle to follow the discussion as a whole. Suffice it to say that it manifests a commendahle lack of that "cock-sureness" in matters heyond the range of direct historic evidence which sometimes mars philological investigation. In view of recent recriminations in the more important field of athletics, it is refreshing to note that this contribution to a Harvard puhlication is the work of two Yale scholars, Professors Hanns Oertel and Edward P. Morris.

Students of Shakspere and his Italian sources will be interested in a tiny volume published by Sansoni in Florence, with the title 'Romeo e Giulietta.' It contains, after a hrief and scholarly introduction by Cino Chiarini, the *novelle* of Luigi da Porto and Bandello, and Professor Chiarini's prose translation of "Romeo and Juliet," followed hy a few notes. This version, which seems to he the fourth made in Italy in the last half-century, is a careful piece of work, and reads surprisingly well, except in some of the speeches of *Mercutio*, where an adequate rendering is impossihle. Professor Chiarini had previously made himself known as a translator hy his version of the Tale of the Oxford Scholar, from Chaucer, and of Carlyle's 'Dante and Shakspere.' The dainty hut inexpensive little hook is dedicated to Dr. Furnivall.

"Winning the West" is the felicitous title of an account of Governmcnt irrigation work, in the *National Geographic Magazine* for February, hy C. J. Blanchard, engineer United States Reclamation Service. He describes the most important of the thirteen projects now under construction, and summarizes the three years' work of the Service. Seventy-seven miles of main canals, some of which are the size of small rivers, fifty-four miles of distrihuting canals, and 186 miles of ditches have heen huilt, together with 125 miles of road and 150 miles of telephone. The remarkable transformation of the country resulting from this work is illustrated hy the fact that a small tract in southern Idaho, which two years ago was ahsolute desert, has now three towns with 120 husiness houses, three newspapers, one private and two State hanks. On the other hand, Roosevelt, in the Salt River reservoir site, a city with electric lights, waterworks, school-houses, stores, and churches, and a population of nearly 2,000, will be suhmerged more than 200 feet when the dam is completed. It is estimated that the reclamation of the irrigable desert land in the West will add to the taxahle property of the nation $2,350,000,000, and provide farm homes for 600,000 families. The address of Chairman Theodore P. Shonts on the Panama Canal contains little that is new or of value, heing largely taken up with a general denial of the charges of johhery, immorality, and inefficiency on the part of those engaged in its construction. More interesting is the account, by Capt. Geo. S. Gihhs of the Coast Survey, of transportation methods in Alaska, in the course of which he remarks that while the introduction of the reindeer has improved the deplorahle condition of the Indians, these animals will never become an important addition to the transportation facilities of the country. But the dog plays a part in the Alaskan life that is indispensahle, and for which there is no substitute. This number is illustrated, profusely and heautifully, with reproductions of most interesting photographs.

An entirely new move in the secondary-school world of Germany is the estahlishment of a semi-scientific Realgymnasium for girls in Berlin. The City Council has accepted a curriculum for such a school in range corresponding to the so-called "Reform" gymnasium, from the Lower Tertia to the Upper Prima. Hitherto only classical gymnasia have been estahlished for girls in Germany, and of these there are said to be now twenty-five in all.

Tempora mutantur. The Sultan, who has

rather stubbornly resisted the introduction of electrical appliances in the empire, has recently granted the concession for the electrical lighting of the city of Jerusalem, and for a trolley system in the sacred precincts, which is to be practically an interurban road, extending to Bethlehem, Bethany, and probably even to Jericho and the sacred sites that mark the tomb of Moses. The plans include even a further extension to Amman, where connection will be made with the railroad that is being built from Damascus to Mecca. Damascus also is to receive a complete system of electrical street cars, the power to be supplied by the historic Abana River, generally known by the name of Barada. Beirut, the most progressive and modern city in Syria, is now also moving to get concessions for electric lighting and cars. A number of religious journals on the Continent are protesting against this "desecration" of sacred places, deploring, *e. g.*, that the Jerusalem-Jericho track must go directly over the Mount of Olives. This last-mentioned road, and probably the others, too, at any rate will be built by a German company.

—The illustrated magazines for March signalize "the first and dubious signs of spring," as Livy would put it, by a copious supply of out-door literature. *Scribner's* opens with the record of an automobile tour of 1,300 miles "through five countries, across twelve frontiers, and over five Alpine passes," from the pen of Henry Norman, M.P., and copiously illustrated by the author's own camera. Incidentally, the photograph of the winding road up the Stelvio pass demonstrates with unusual force the possible mendacity of the camera, exactly reversing, to the eye, the direction of the incline. Following Mr. Norman, Frederick Van Beuren, jr., essays with fair success to put into verse the geologic birth and growth of the Red Cañon. We must object, however, to "the shriek of the grinding ice." Ice may grind and ice may shriek on due occasion, but the conditions precedent and the audible consequences are essentially separate. N. C. Wyeth comes next, describing "A Day with the Round-up," with his own drawings, several of which are reproduced in the vivid colors so familiar to readers (or should we say *spectators?*) of the descriptive literature of the Southwest. Even the stories, for the most part, have a distinctive out-door flavor. In separate titles, if not in comparative space, *Harper's* is not far behind as an open-air number. "A Night's Ride with Arab Bandits," "In Western Camps," "Ibex Shooting in the Mountains of Baltistan," and "A Colorado Glacier" are among the titles. Philip Verrill Mighels offers a poetic conceit on "The Desert," which the Creator, weary of the sins and carnage of the life filling all other parts of his creation, has made "as a place to be alone." Evidently the poet has not read the chapter by John C. Van Dyke on "The Life of the Desert." There are few places, if any, where the struggle for existence is more cruel and unceasing. The *Century*, too, opens with a paper in the same general field, route notes in Sicily, "The Garden of the Sun," by William Sharp. The illustrations are from drawings by Jay Hambidge, and picture chiefly incidents in the life of the natives (mostly out-door life) rather than the scenery.

—The *Century* has a paper of practical suggestions, by Sylvester Baxter, on "Art in the Street," with drawings by Jules Guérin and Malcolm Fraser. Guide-boards, lamp-posts, telephone poles, fire-alarm and police-signal boxes, letter-boxes, watering-troughs and drinking-fountains are among the various utilities, now generally a source of odious disfigurement to village and city streets, which might, as the writer contends, be so designed as to be a source of pleasure and satisfaction to the eye and an elevating æsthetic influence upon the community. In the same number Charles De Kay gives a general description of the architecture and decoration of the new New York Custom House. The feeling so universal among lovers of things artistic crops out in his comment that the architect has not seen fit to express, even in some allegorical manner, the position of free-born Americans in allowing themselves to be treated as slaves by the collectors of customs, for the alleged good of the country. Perhaps a typical trunk-searching scene might yet be depicted on one of those wall spaces upon which Mr. De Kay thinks that the art of painting should have some worthy recognition. The general result he regards as highly creditable to the architect, chosen by competition under the provisions of the Tarsney act, and as a full justification of the abandonment of the old method, "when Government buildings were designed at Washington by the gross, and carried out without a thought of adaptability to the climate or surroundings, not to speak of beauty as objects of æsthetic pleasure."

—Students of comparative religion will be interested in Professor Bloomfield's account in *Harper's* of the recent discovery of portions of the long-lost Manichean Bible. These fragments were a part of the rich archæological treasure unearthed by Dr. Alfred Grünwedel at Turfan, in the extreme east of Chinese Turkestan, under the auspices of the German Government. They are over eight hundred in number, and are the sole known remnants of the literature to which they belong. During the past summer, Professor Bloomfield spent several weeks in Berlin, and had an admirable opportunity to examine the fragments with the constant assistance of Dr. Grünwedel himself and of Dr. F. W. K. Müller, of the Berlin Ethnological Museum, an eminent Orientalist of the younger generation. Biblical scholars will be interested to see the large Christian element which appears in these fragments. Indeed, in some passages Mani seems to be wholly identified with Christ, though elsewhere Christianity is vigorously assailed. Dr. Grünwedel has returned to Turfan to continue his quest, carrying with him a grant of 83,000 marks, and it is confidently to be hoped that large additions may be made to his already remarkable discovery.

—Prof. F. W. Taussig takes the leading place in the *Atlantic* with a paper on "Love of Wealth and the Public Service." He finds several motives which tend to hold capable men of business steadily to the work of money-making, regardless of need. Any man of energetic temperament feels that he must be doing something, and the man who is once inured to business habits really finds little else that he can do successfully. Again, there is the natural joy of accomplished ends, or the stimulus of success, as a recent educational writer has called it. But the play of these motives is crippled in the public service by the short tenure of office and the numerous checks and balances by which a jealous democracy insists upon guarding against possible abuse of delegated power. Professor Taussig recognizes that these checks are in large degree inseparable from democratic government, but still hopes that more leeway may in time be given for the exercise of unhampered individual initiative in executive positions, so as to make public service more tempting to men of great business capacity. Considered in the abstract, his position is plausible, but the removal of restrictions upon men in positions of trust will proceed somewhat slowly until the insurance scandals are forgotten. A. Maurice Low presents a glowing defence of the German Emperor against what he conceives to be the most cruel misinterpretation of motives, misconstruction of actions, and ridicule of purposes to which any great historical character has ever been subjected Mr. John Corbin's plea against the extravagantly pictorial stage of modern times as a vehicle for the presentation of Elizabethan drama, we have discussed elsewhere.

—In the *Quarterly Journal of Economics* for February, Prof. Adam Shortt contributes a paper on Canada's anti-dumping policy, which throws unexpected light on the true inwardness of that unique piece of legislation. Canada is the only country which has actually legislated against dumping. Her tariff act contains a clause by which articles that are sold in Canada at less than the market price in the country of exportation, are subjected to a special duty, equal to the difference between the market value and the selling price. This affects, of course, chiefly the United States, and especially such articles as pig iron, steel rails, girders, and the like. But other articles also, including some that come from Germany, are affected by the provision. Now the natural explanation of this sort of thing is that it is a protectionist device, meant to prevent the wicked foreigner from underselling. In fact, however, it is in Canada a device not of the protectionists, but of the free traders. It appears from Professor Shortt's account that the protectionists had set up the practice of dumping as justification for demanding a general increase of duties. The liberals, as a means of stealing the protectionist thunder, adopted the anti-dumping duty—but stopped there, having a plausible ground for saying the only real difficulty had been met. At all events, Canada gets a tidy revenue out of extra duties imposed on articles that are sold in Canada at what our monopolists euphemistically call "export rates." The administration of this system calls for the maintenance of special agents to keep watch of prices in American cities, and seems to be carried on with a good deal of discretion. Information is treated as confidential; and when the Government of Australia applied to the Canadian Government for points as to dumping, the Canadian Government refused to comply with the request. We note also, in the same issue, Professor Ripley's article on the trunk-line rate system, which he de-

scribes as a distance tariff, and adduces as indicating the principle on which railway rates in general should be adjusted. The instructive map which accompanies his article certainly makes it plain that the trunk lines have in fact worked out their competitive problems on the principle of distance.

—In the interest of economic government in the Philippines, a scheme of consolidation of bureaus has lately been carried into effect. One of its results is to incorporate the Mining Bureau with the Bureau of Government Laboratories, the new organization to be known as the Bureau of Science, of which Dr. Paul C. Freer, formerly of the University of Michigan, is director. Hitherto, there has been some confusion and tendency to duplication in scientific work and publications at Manila (though far less than at Washington). Henceforth, separate bulletins will not be issued at irregular intervals, but all scientific papers will be published in a new journal to be known as the *Philippine Journal of Science*. The agricultural, forestry, and health branches of the Government service will, of course, continue the separate publication of bulletins for popular circulation. The subjects covered by the new organization of the Bureau of Science and to be especially treated in the new journal are: researches on biological subjects, including bacteriology, pathology, and allied branches of the science relating to medicine, botany, and zoölogy; on chemistry, including topics relating to the natural products of the Philippine Islands, to analytical and synthetical work, and to physiological and biological chemistry; researches relating to the fields of serums and prophylactics and on mineralogy, geology, and palæontology, including investigations of the mineral resources and mining operations of the Philippines. Ten numbers a year will probably be the minimum of issues of the *Journal*. The subscription price will be $5 per year, single numbers 75 cents, and reprints of papers 25 cents, remittances to be made to the Director of Printing, Manila, P. I. The publications by the Philippine Bureau of Government Laboratories during 1902-1905 number thirty-six bulletins, the majority of them biological or pathological studies of tropical diseases affecting the human family or of the animal plagues which have wrought so much disaster in the Philippines. There are also some noteworthy additions to the knowledge of Philippine botany by Elmer D. Merrill, various chemical researches into Philippine products, and studies in Philippine ornithology. These bulletins have heretofore been sent free on application, and some copies of them are still available.

—The title, 'Negro Humour,' of Mr. J. Graham Cruickshank's trim little volume issued at Demerara from the *Argosy* press would lead a North American to expect something more comic than he will find. These "sketches in the market, on the road, and at my back-door" are "impressions," a term which the author himself applies to the chapter on Bridgetown, Barbados. They are delicate vignettes, little studies artistically rendered; and the humor is more in the writer's sympathy and insight than in the sayings and doings of the people of color. Indeed, this class is so intermingled in action and conversation with two others—the "Sammies" (East Indian coolies) and the "Potagee"—that one does not readily differentiate them by the test of humor alone. This, however, is a small matter, and anybody may profit by reading these glimpses of British Guiana, Barbados, and Jamaica. One character, "Old Gordon," has a sketch to himself, of some historical value; and the chapter on Wakenaam is economically instructive, as it makes a faithful but not unkind comparison of the negro's status before and since emancipation. Mr. Cruickshank furnishes a glossary, which is needed. His text is pleasantly interspersed with colloquialisms, used to heighten the local color, like "upperside the potato field," "face well and wrinkled," "middle-day," "in the crop." One will not laugh over this book, but it is none the less agreeable.

—The annual art competition of the leading newspapers of Tokio and Osaka shows the results of the war and what are the thoughts uppermost in the minds of the people, though rather to the detriment of pure art. In the bundle of newspapers published on New Year's Day in these two great cities, imperial and commercial, we find that, in ten of the multiple editions of forty or fifty pages each, five of the illustrated supplements are mechanical rather than artistic. The Emperor in one and Togo and Oyama in another appear in colors and gold. There is a sheet of portraits in half-tones, of twenty-two princes, generals, admirals, and statesmen, while another is occupied with views of the chief palaces or Government buildings of the world. The *Illustrated Nippon* contains pictures of pretty women and notable landscapes, one of these being the great double or twin rocks, linked together with the ceremonial rice-straw rope, and the larger crowned with a *torii*, to see the sun rise between which tens of thousands of people, gathering at New Year's Eve, assemble on the seashore and neighboring hills near Isé. One journal issues the sign-manual of a famous calligrapher, of slight interest indeed to an Occidental, but as full of suggestion to a Japanese as a new fishbone would be to Agassiz. This finishes the inventory of black and white. A map of Tokio in colors and a sheet of pictorial postal cards with mirth-provoking suggestions of the funny situations caused by the jostling of old and new, foreign and native customs and notions, add variety to the New Year's gifts of enterprising newspaper publishers. The color sheets are gems of artistic skill, and each one is signed by the artist's name. One, a glory in deep purple, with a spring-like background of flower-decked meadow and blossoming trees, shows a young girl, holding in one hand a white dove and in the other a sprig of pink blossoms. Another piece, twenty by twelve inches, representing a noble matron with her two young daughters in the coiffure and costume of five centuries ago, is a glory of harmonious coloring. The sprig of plum blossoms suggests the spring, for, according to the old chronology, New Year's Day came in February. One sees how difficult it is for art traditions to change with the almanac, for now the Japanese New Year's is that which the Western world keeps. Inferior to none in drawing, expression, and pose of the figures, though with appropriate moderation in tint, is another piece in color, depicting two lads on horses caparisoned in the olden style. The bamboo and plum tree in the background tell, by their symbolism, of life that has not yet reached the stadium which the pine tree always suggests. This exhibition of pictures set against a wall gives a true index of the national taste, temperament, and power of the art-loving Japanese.

RAILROAD PROBLEMS.

American Railroad Rates. By Walter Chadwick Noyes. Boston: Little, Brown & Co. 1905.

Restrictive Railway Legislation. By Henry S. Haines. The Macmillan Co. 1905.

Government Regulation of Railway Rates: A Study of the Experience of the United States, Germany, France, Austria-Hungary, Russia, and Australia. By Hugo Richard Meyer. The Macmillan Co. 1905.

These three volumes contain the weightiest contributions made in the last calendar year towards elucidating our vexatious problem of railroad transportation. While unequal in value, they each contain material which we could ill afford to lose. The author of 'American Railroad Rates' is at the same time a judge of the Court of Common Pleas in Connecticut and president of the New London Northern Railroad Company. The very juxtaposition of titles will probably affront the Grangerite, but an impartial survey of the book will demonstrate that this conjunction has not been without its happy influence. It has blended the knowledge of practical railroad administration with a judicial insight into the duties which common carriers owe to the public. Mr. Haines's book comprises the substance of a course of lectures delivered at the Boston University School of Law, and abundantly bespeaks the experienced railway expert. Mr. Meyer is assistant professor of political economy in the University of Chicago. His book sweeps a wider geographical horizon than the other two, and is fortified with a wealth of annotative footnotes. Unfortunately, the scientific detachment which might be expected from an academic investigator is sometimes conspicuously absent, and the strong brief which Mr. Meyer files in favor of the railroads betrays an unmistakable *parti pris*.

Judge Noyes gives at the outset an admirable exposition of the fundamental principles of railway economics. A student of transportation fresh from the perusal of Acworth's 'Elements of Railway Economics' would inevitably be tempted to draw "the deadly parallel" against Judge Noyes's introductory chapter on "Underlying Principles." But, in a footnote on page 20, and once again on page 66 in a similar reference, the tree from which the golden apples were shaken is indicated as "an admirable little book of high authority." In a court of literary ethics it is questionable whether this bare acknowledgment would constitute a *pretium justum*. If, however, his theoretical outline was appropriated from another, Judge Noyes has given it a dress even more suitable for American readers than the original. Those who believe on *à priori* grounds that railroad

charges should be based on cost of service, equal mileage rates, or on postal principles, will find the refutation of these proposed systems unanswerable. Equally excellent is the description of the actual process of rate-making, while chapter iv., on Classification and Tariffs, is the best account in short compass of that perplexing subject available for the general reader. The author has refused to allow his immediate business interests to blind him to the real evils inherent in our present transportation system. He frankly avows (p. 103) that "Rebates and other personal discriminations too often have driven the small manufacturer from the field and left it free for the corporate combination." On the other hand, he thinks that the present law, with such changes as are necessary "to bring within its provisions . . . private cars and terminals, . . . seems to go as far as any law can go to stop personal discriminations" (p. 121). But he further acknowledges that the existing law "does not effectively reach preferences created by the tariff [railroad], or discriminations which the published rates are formed to carry out" (p. 123). Conservative as Judge Noyes is in his plan for remedying the evils of the situation, his discussion of the problem is without any unfair bias. Or if any bias is evident, it is rather the misgivings of the jurist scrupulously fearful of any departure from the letter of constitutionality than of the railroad man willing to gain a doubtful advantage for his own profit. Of 'American Railroad Rates' it may be said that it is as a whole the best balanced book on the subject that the present controversy has evoked. Its comparative brevity—it contains only 260 pages—should commend it to the busy man who wants something more than a mere superficial presentation of the railroad problem.

'Restrictive Railway Legislation,' the title of Mr. Haines's book, is somewhat misleading. It indicates rather the goal to which his argument is directed, or the impulse from which his discussion took its rise. It is not fairly descriptive of the book's contents. Indeed, no name short of Essays on Railroad Transportation would cover the variety of topics with which it deals, for railroad construction, operation, organization, finance, rate-making, and legislation all come under review. On all these subjects Mr. Haines has something to say, although his discussions are very uncqual iu merit. Where he speaks as a technical expert, he is surest of his ground. Where he essays a theory of reasouable rates, he is weakest. Where, finally, he attempts a philosophic résumé of the underlying forces which have been operative in our railroad history, he attains a very high degree of success.

It will probably surprise many to learn that "the region westward from Massachusetts to the Mississippi River and southward to the Potomac and Ohio Rivers is now better supplied with railroad lines per square mile than Great Britain is" (p. 103), but Mr. Haines speaks here with the word of authority. So, too, his judgment is weighty where he concludes that "the provisions for safety upon our railroad system are not up to the standards abroad, and that they have not kept pace with the increasing speed of trains and density of traffic" (p. 132). Almost equally illuminating is his comparison of English and American methods of railroad financiering, especially his unfavorable contrast of our judge-made receiverships with the English procedure for the protection of debenture holders. The practical railroad man is equally in evidence in his history of the formation of rate-sheets and in his significant disclosure of methods of according disguised rebates, as, for instance, by recognizing the switching tracks of an industrial concern as an independent railroad company, and by allowing large arbitrary percentages of an alleged joint rate (pp. 151, 152) to this pseudo-carrier.

His most unsatisfactory chapter is the one in which the question is raised, What is a reasonable rate *per se*? Instead of taking Judge Noyes's wary though indefeasible position that reasonableness is always a comparative matter, and that it is about as easy to demonstrate that a certain river is deep *per se* as that a specific rate is reasonable *per se*, Mr. Haines attempts a solution of the question. He shows in the first place that *à priori* contentions for basing rates on the value of railroad property or on the cost of affording transportation service are simply inapplicable to the fixing of specific rates. His negative contention is undeniable. He proceeds to find the essence of reasonableness in a compromise rate which affords a margin of profit both to shipper and to carrier. If all traffic were non-competitive, he thinks this test would be all-sufficient. When, however, shippers at competitive points obtain relatively lower rates than are exacted from the shippers at non-competitive points, the further question arises whether the low competitive rates are reasonable from the standpoint of the shippers who pay the higher rates. Here Mr. Haines, in his economic casuistry, distinguishes between natural and artificial competitive points. Where the shipper has a choice of water or rail routes, the low rate he obtains is no injustice to the shipper who must pay high non-competitive rates. But where the shipper at a junction point of competing roads obtains a disproportionately lower rate than the local shipper served by a single carrier, the rate is unreasonable, so Mr. Haines thinks, and should be adjusted by pooling or statute to the higher level of local rates. It may be observed that the distinction here drawn by the author has been disallowed as a proper construction of "the long and short-haul" clause of the Interstate Commerce Act by the Supreme Court in the Alabama Midland case (168 U. S. Rep., 144). But the chief fault to be found with Mr. Haines's criterion is that it really fails to determine anything with precision. If any rate, with the exception noted above, that affords a margin of profit to carrier and shipper is reasonable, there is an infinite number of rates reasonable *per se* for any given railroad service. Even this fails to indicate adequately the looseness of the criterion suggested. If ten shippers at a given point contiuuously ship the same commodity over a certain line, the rate is presumptively reasonable. A lower rate might enable fifteen shippers to forward the same commodity over the same line. Now if the increase in the volume of traffic makes the new rate a paying rate to the carrier, this again will be a reasonable rate. Or, the carrier might double the original rate so that five of the original ten shippers might be no longer able to stand it, and yet the lessened service required of the carrier might make the new high rate a profitable and hence a reasonable rate conformably to Mr. Haines's specifications. Where such latitude is possible, the rule proposed becomes practically useless. One might as well define a reasonably pleasant day as one unattended by a blizzard or a cloud-burst. Having attempted a profitless task, Mr. Haines makes a bad matter worse by a futile attempt to allocate particular railroad earnings to specific transportation services. This culminates in the allegation that, in 1902, permanent improvements ($42,000,000) and the reserve fund ($105,000,000) were provided from "other sources" than "receipts from passenger and freight service" (p. 191).

For his lapses in the discussion of reasonable rates, Mr. Haines amply atones in his two concluding chapters. Here his tone is philosophical, and the breadth of his handling of the historical factors which have controlled our public policy in railroad matters, is most admirable. Particularly significaut is his showing that the legal prohibition of pooling has had for its result the very consequences the legislators were so anxious to avoid—namely, the consolidation of great lines into greater "systems." Apprehension is now aroused over "the anticipated consequences of unrestricted combination, and it is mainly to remedy abuses of this character that there is now a popular demand for the further regulation of railroad affairs by legislation" (p. 329).

Professor Meyer's book contains in Part I. an analysis of Government fixing of railroad rates in Europe and Australia, and in Part II. an historical exposition of the setting of railroad rates in the United States. He narrows the railroad problem in this country to the question whether the Government should prescribe rates for the purpose of guaranteeing their relative reasonableness. Extortionate rates, he contends, are out of the question when the returns on actual investments in our railroads do not exceed 5.5 per cent. even in times of abounding prosperity. And secret rebates, he asserts, are in no wise rendered less likely, but rather more likely, when the rates are set by the Government instead of by the carrier. In general, this author concludes that Government-made rates arrest the decline in transportation charges, and, by gravitating towards a mileage basis, prevent the development of a volume of traffic sufficient to secure the highest attainable efficiency in railroad service. In Germany, for example, the uniform haulage charge per ton-mile apportions trade, he thinks, iu a mechanical way, and actually discriminates unjustly in favor of those districts with waterways as against those without this means of relief (p. 47). The comparative rigidity of the rates on Prussian state railways he illustrates by showing that while general prices in Germany fell between 1880 and 1899 by 17.6 per cent., railway charges fell in the same period only 14.7 per cent., while in the United States the corresponding decline was 24.3 and 41.7 per cent., respectively (p. 93). The mileage basis which Governments adopt in the setting of rates is due not so much to considerations of cost as to the necessity of having

some hard-and-fast rule of action admitting the exercise of no discretion. The significant utterance of Von Miquel (p. 456), regarding the necessity of having "the stone wall of a system" if effectual refuge was to he had from the jealousies and conflicts of local and sectional interests, points to the reason why Government-made rates must he inelastic. This same rigidity in rates is found by Professor Meyer to exist in republican France and in socialistic Australasia. In the latter country he finds the absence of the "basing-point system" responsible for the undue concentration of population and trade in Adelaide, Melbourne, and Sydney. To the same cause he attributes "the ridiculously low average of the train load in Australia—seventy-four tons in New South Wales" (p. 198).

Part II. recounts the experience of the United States in the matter of railroad rates. Professor Meyer is an uncompromising protagonist for the railroads. But if one makes allowance for this personal bias, there is much to he found in the volume of the first order of importance. Abundant illustration is afforded of the danger in every country that railway rates may become the football of sectional politics. Professor Meyer is undoubtedly right when he says (p. 278) that "in every large country there is a constant tendency toward interprovincial protection, which is effectually counteracted only by the absence of opportunity for its realization." He is also interesting, if not absolutely conclusive, in his description and defence of the "basing-point system." The contention set up—that it creates a multitude of interior distributing points, and thus curtails what would otherwise be a monopoly of seaboard cities—is ingeniously developed. In his latter chapters, where he turns his artillery on the decisions of the Interstate Commerce Commission, it must be admitted that his fire is very damaging to that body's prestige.

Notwithstanding the hard work which the volume embodies, the final verdict must be that it is the plea of the advocate, not the deliverance of the impartial judge. With all his abhorrence of Socialism, the author's temperament is emphatically that of the typical Socialist. He can see only one side of the case. He cannot always resist the temptation to fling mud. A decision as to milk rates, he remarks *obiter*, "decided how much milk from cows fed on brewery swill the people of New York must consume" (p. 385). His unfortunate allegation that the absence in Germany of group rates on milk accounted for the 14,000 cows stabled by the Von Bolle firm within the city limits of Berlin (p. 387) has proved to be wholly untrue. Moreover, one can but suspect something like chauvinism in his virtual plea for non-interference with rate-fixing when a railroad president like Judge Noyes explicitly asserts that "existing remedies afford the shipper inadequate relief from unreasonable charges"; and that "it *is* important that the shipper should have an opportunity of presenting the justice of the charge complained of, in an expeditious way, to a disinterested tribunal."

In the matter of remedial legislation, Judge Noyes and Mr. Haines seem to agree in upholding what may fairly be called the railroad position. This is, in brief, that the separation of legislative and executive functions decreed by the Constitution makes it legally impossible that one and the same body shall exercise both the power to pass on the reasonableness of existing rates, and the power to set rates for the future. The former is alleged to be an exclusively judicial function; the latter, an exclusively executive or administrative function. If this contention be valid, the courts must be entrusted with some part of the work connected with rate-fixing, over and above their right to take cognizance of any rate alleged to be confiscatory. It behooves a layman to tread warily in this maze of constitutional law, but we may venture to suggest that when the Board of General Appraisers is given the power to determine the value of any import, and when no appeal may be taken from their decision to the courts, it looks very much as though what the railroad men describe as an exclusively judicial function, to wit, the determining the reasonableness of appraisal, were being performed by an administrative body. It may also be suggested that when the courts enjoin upon a carrier conformity to a certain published rate-schedule, the courts seem to be doing something akin to setting future rates. Whatever the validity of the railroads' contention in this particular matter, the ultimate settlement of our transportation problem must depend on the recognition of several cardinal truths. These are: that the same tribunal cannot act successfully in the dual rôle of inquisitor and judge; that public opinion will not rest in a system of legal appeals that so protract litigation as to defeat the ends of justice in the matter of railroad charges; and that nothing is to be gained in the long run by attempting to shelter the administrative fixation of carriers' charges from judicial review in the cold clear light of reason and of law.

GREENSLET'S LOWELL.—II.

James Russell Lowell: His Life and Work. By Ferris Greenslet. Boston: Houghton, Mifflin & Co. 1905.

In the course of a microscopic examination, aided, one might say, by the Röntgen rays, Mr. Greenslet shows that Mr. Lowell's prose was akin to his conversation and his letters—"struck off," as he himself says of Dryden, "at a heat, in the best mood of his talk." Many of the essays were, in fact, primarily lectures, or talks, with all the *négligé* of expression which in conversation is rather a virtue and a charm. Hence, various blemishes—looseness of structure, discursiveness at will, imperfectly coherent paragraphs, an occasional ragged or ill-sounding phrase, an occasional ebullience of metaphor. Lowell wrote too often in haste and with impatience, and he did not use the file. He permits himself to dart off in pursuit of the whim or suggestion of the moment or in search of a purple patch which he had stored from his wide reading. All these blemishes may, in fact, be detected and may bar Lowell's style from the title of Attic; but they are blemishes rather for the eye of the literary expert, and it is surprising how little they detract from the gusto and allurement of his manner for the unprofessional reader and the layman.

An old friend of Lowell's tells us that he was "as indifferent about style as a man ought to be." On the other hand, in one of his own letters, Lowell regrets that his style is becoming old-fashioned; that it is already a thing of the last century. This does not look like indifference, though the regret is certainly superfluous. There are many varieties of good prose, and Lowell's had the supreme merit of sincerity. It expressed and fitted perfectly his rich personality and many-sided endowment. If his style was not Attic (and why, indeed, should we all atticize?), it was certainly not Asiatic—nothing was there for mere decoration. His teeming metaphor and illustrations were his natural and inevitable expression. He opened his mouth, and that kind of jewels simply fell from his lips. But this easy opulence does not in the least imply entire want of discipline or indifference to his art. No one understood better than he wherein consisted the hidden harmonies of rhythmical prose—he gives a perfect definition of it in his essay on Milton's 'Areopagitica'—and no one could better illustrate these harmonies when the mood and the occasion fitted. He knew perfectly well that the diction of elevated thought and emotion is naturally rhythmical, moulding itself upon the inner waves of feeling and of thought; and the best of his later public addresses exhibit a very noble style, worthy of the weight and dignity of the matter which it clothes. The address on Democracy and the Harvard Anniversary address, which reach quite beyond the range of the mere man of letters and enshrine the ripe wisdom of the thinker and the statesman, contain sentences that remind one of the music of Sir Thomas Browne or the large discourse of Burke. They have the same grand air, and are engendered of a similar mood of reflection and lofty imagination. Such cloth of gold is not ordinarily "tailor-made" for every-day wear; but it will never go out of fashion when worn by kings. Shall we forget Bach and Beethoven and Haydn because Wagner is now all the rage?

There is another feature which is noticeable in the addresses, and, to a less extent, in the essays on literature. In his witty and amusing account of a meeting with Landor Lowell mentions an epigram which that explosive personage once hurled at Wordsworth: "One may mix as much poetry with prose as one likes—it will exhilarate the whole; but the moment one mixes a drop of prose with poetry, it precipitates the whole." This is, in the main, strikingly true. Lowell often mixed the fatal drop of disillusion with his verse; and, on the other hand, he most felicitously exhilarated his prose not only with the colors of fancy and humor, but with the gleam of poetry. In the address given before the Wordsworth Society, he speaks of Wordsworth's poetry as "the Chartreuse," dedicated to the "Genius of Solitude," to which pious souls retreat at intervals for "communion with things that are heavenly." As criticism, the thought is absolutely just and felicitous, while the paragraph which enshrines the comparison contains the material of a sonnet expressed in rhythms more exquisite than the mechanic grind of many a sonneteer. Thus does Lowell take unfair advantage of the more pedestrian

essayist, and handicap him by the charm of his genius as well as by his humor. He allures and compels the attention of his reader, whatever may be the intrinsic merits or defects of his conclusions.

As to the final value of his criticism, it must be admitted that it was in some slight measure amateurish—that it lacked a little in system, in method, and completeness; he did not always verify his memories or weigh his judgments. He was not exactly the painstaking analyst, bent on reaching the heart of his subject and reporting the *vérité vraie* in its totality. He gives us rather a series of impressions, views and observations as they come into his mind. But when all is said about method, the worth of the critic depends largely on his own mental furniture—his knowledge of art, of books, of history, of mankind, the quality of his insight and divination. We listen to him for what he has in himself. He carries away from his author no more than he brings. If we are to see things through his eyes, he must be much more than a mere cicerone. He may have all the method you please, and yet be as unprofitable as a stamp-mill without ore and water, or a ship without freight. He may be as jejune and unprofitable as the forced green fruit of many a Ph.D. in literature, constrained, poor fellow, to bring his wares prematurely to market. *He* has method—fresh from the laboratory, modelled on Ste.-Beuve's, and he lacks only matter and manner.

Lowell, on the contrary, carried an enormous freight of learning, of observation, and ideas, and he applied it, as a rule, with taste, good sense, keenness, and penetration. His resources were exuberant, and spent with a brilliant prodigality. His range of illustration covered nearly all that was most precious in the great literatures. Even his Greek, in which he was too modest, enabled him to divine what M. Bréal, with the wider sweep and *netteté* of his learning, has lately been enforcing—that Homer *archaizes*, and that we must not take too literally his pictures of manners and customs. All this wide realm of gold he levies on with the lightning dart of Ariel. Whatever he appropriated, he lit with the sparkle and colors of wit and fancy and imagination. Hence, if he digresses, we can follow him with cheerful resignation. The more pedestrian essayist may lead you along a straight path under a dull sky. Lowell is a companion who gives you the effect of travelling in the morning sunlight when the dew is on the grass. If you ramble a little, it is in the edifying and delectable society of a man of genius.

Notwithstanding the breadth of his culture, he had his blind sides, as Mr. Greenslet remarks, and he nursed some hearty prejudices. The superfluous heat of these makes itself felt, for example, in the essay on Carlyle and "On a Certain Condescension in Foreigners." He professed not to understand Browning; and Swinburne, for other reasons, was a pet aversion. With the French people and with a certain school of French literature he had very imperfect sympathies. Zola formed a convenient nadir of comparison—a standard dweller in the bottomless pit. For the great qualities of his genius, as well as for Swinburne's, he had really no eyes. It is easy to discern the root of this severity. He had fixed his mind exclusively on a certain side of their defects, and, as he says in one of his letters, "A man should never write what his daughter may not read." A good rule, perhaps, if we remember that daughters are of various ages, and that in time they grow to reach years of discretion. Mrs. Browning shed tears for "la Dame aux Camélias," and Thackeray felt obliged, as an editor, to decline one of her sonnets in the interest of English *virgines puerique*. Yet one can hardly distrust Mrs. Browning's instincts in these matters. Hence we must occasionally make allowance for Lowell's chromatic aberration and for his personal equation. The Puritans did not exactly see life whole.

In his own fashion and generation, Lowell was a preacher, and kept up the traditions of his father's family; all his life long, as he himself confesses, he "could not get out of the pulpit." He keeps to the pulpit often in his poetry. It fitted his mystical tendency to profess his faith in the unanswerable formula, "I have felt"—which is, indeed, the summary of his creed nobly uttered in the closing verses of "The Cathedral." Though capable of admirable generalizations and comprehensive views in politics and social questions, he had no taste for metaphysics. The mystic in him was afraid of Darwinism and of modern Science, and so he pictured it as the black demon in the poem of "The Old Téméraire"—not imagining that the true theologian might meet the scientist halfway in the tunnel where they search and dig for a comprehensible cause of things. "I am a conservative (warranted to wash), and keep on the safe side—with God as against Evolution"—a declaration as whimsical in substance as in manner to all whose fascinating task it is to disentangle the web that is woven on the loom of Time, as well as to those who hope to find a Weaver. With this attitude it is worth while to contrast the lofty resignation of Matthew Arnold's psalm, "In utrumque paratus." So conservative was Lowell as an editor, Mr. Greenslet informs us, that he struck out of an article of Thoreau's the following sentence referring to a pine-tree: "It is as immortal as I am, and perchance will go to as high a heaven, there to tower above me still." This act of editorial despotism drove Thoreau to open rebellion, and to secession from the *Atlantic Monthly*.

Mr. Greenslet weighs accurately in his delicate balance the merits of Lowell's letters as literature. They bear comparison with the very best, though "we shall never find in them quite the edge, the unity and distinction of Gray's, of FitzGerald's, of Stevenson's." From another point of view, they are an unusually complete revelation of an engaging and many-sided personality—an unreserved confessional which discloses only virtues and charms. For Lowell had in his soul no dark chambers and skeletons to conceal. There are some people who outstay their welcome in this world, and whose persistent survival adds inscrutableness to the mysterious ways of Providence. There are others whom we should wish to live to the age of Methuselah so that their graces and virtues may hasten the millennium; and Lowell was one of these—one who could never have been in danger of degenerating to a Struldbrug. Ariel, with a spice of Puck, adjusted to the conscience and the backbone of a line of Puritan ancestors; a sincere democrat who was never more at home than in the society of grandees; a poet who had an abnormal passion for paying his debts; a contented bookworm and a successful statesman—these are some of the fascinating opposites which emerge and blend together in Lowell's character. He had the gifts that dazzle, the traits that allure and win, the powers that command respect and admiration. All these show in his correspondence, and account for his friendships. You find there the winking, beaded bubbles of his effervescent, irresponsible talk; you light on a letter which, for its whimsicality, might have been written by Lamb, or, again, upon a masculine declaration like this: "My opinions do not live from hand to mouth; and so long as I live, I shall be no writer of birthday odes to King Demos any more than I would to King Log; nor shall I think *our* cant any more sacred than any other." And so the reader, when he has finished the last letter, feels that he has parted from a friend; he renews that old sense of bewilderment at the wastefulness of Nature, which carelessly deflowers and unmakes a growth so rare and beautiful and strong. In this feeling, stranger though he be, he will have rendered precisely that tribute which Lowell always craved: "I would rather be loved than anything else in the world."

FURNITURE OF WINDSOR CASTLE.

The Furniture of Windsor Castle. By Guy Francis Laking, M.V.O., F.S.A., Keeper of the King's Armory. Published by Command of his Majesty King Edward VII. London: Bradbury, Agnew & Co.; New York: Dutton. 1905. Pp. xx., 200; also 47 plates.

This book is a very handsome quarto, and there are certain indications that it forms part of a series, proposed or already begun. Thus, on the bastard title is printed in red "The Royal Collection," this being quite separate from the title of the book proper. In another place there is mention, as if it already existed, of a book on the armor of the royal collection. Again, it is announced in the introduction that the "splendid clocks, the interesting series of bronzes, the fine porcelain, and the decorative objects generally will be dealt with in forthcoming volumes." It would seem, then, that everything in the Windsor collection, except the paintings and statuary, is to be described in the series of books which will be of value for their plates at least, if for no other reason. It is quite well known that there is much magnificent porcelain at Windsor, and also well known that it is almost impossible to get sight of it—wholly impossible to study it with any thoroughness. The castle is essentially a residence. No pains have been taken to separate from the private apartments those halls and corridors which must of necessity contain the greater part of the splendid royal collections. You can get admission to the private dining-room of the sovereign almost as easily as you can to the great corridors lighted from the court, in which are arranged cabinets full of as fine portable objects of decorative design as there are in the world.

Now we have in the book under considera-

tion nearly fifty separate pieces of furniture of very great beauty, and presented in excellent photogravures of delicate tint. With this presentation the only not favorable comment that one can make is that nearly every piece is presented so exactly in front face that appearance of thickness, depth, solidity—what you will—has been taken from them. Once in a while, as in Plate 28, the sideboard is so open, with its supporting feet and braces so plainly visible in perspective, that we understand the piece to be thirty inches deep, more or less; but that plate is immediately followed by a great wardrobe of seventeenth-century French work—a splendid piece of the early style of Louis XIV., as to which there is no such certainty. It might be a mere pair of doors pinned against the wall but for the suggestion of a retreating member at the top. The purpose of this choice of a straight front view is undoubtedly to show in great perfection the minute detail of these pieces; and in the case of that very wardrobe, Plate 20, it is so that the author and publishers would proceed in the case of a book prepared for the daily use of the workshop. Books are made in great abundance and at great cost for the obvious and confessed purpose of furnishing designs which can be readily appropriated, and these designs are given as much "in elevation" as possible, in order that the dividers and the scale of the draughtsman may be applied directly to the piece, and the act of "conveying" the design may be simplified. But why the compiler of such a stately publication as this should have failed to see, in his magnificent armoires and commodes, objects having thickness or depth, as well as height and width, it is hard to understand. It is only fair to say, however, that the magnificent French book dealing with the furniture in the Louvre and published about 1901 gives the greater number of its splendid specimens in this same precise and non-descriptive way.

The plates and the text of the Windsor book are divided into groups. Thus, furniture, English and Continental, is kept apart from French furniture, and the first division is of this non-French work from 1640 to 1700, the second of English furniture of the eighteenth century; the third, of that of the nineteenth. One chapter with three plates is devoted to tapestried hangings, four chapters are devoted to French furniture of the times of Louis XIV., XV., XVI., the nineteenth century, and so on. There is, however, no very exact classification. Thus, Plate 13 (inserted curiously out of its numerical order) is devoted to the throne of the King of Kandy, which, although said to be partly Dutch in its conception, is yet wholly Oriental in the enrichment. It is covered with plates of pure gold and of silver-gilt, embossed and chiselled in the most elaborate fashion; the arms are wrought into the semblance of grotesque lions, and a prodigious frieze of amethyst "crystals" and white sapphires adorns the back, while other amethysts serve as eyes for the savage creatures, and "a large pear-shaped white sapphire" is set in the back just above the head of the occupant of the throne. These explanations come from the description at page 14, where also the dimensions are given, the place of manufacture, and the time and place of seizure by the British forces. And in the way of further study of Oriental art, though of a more grave and significant character, Plates 17, 18, and 21 present three very fine Japanese lacquer cabinets, which are mounted on very respectable and even appropriate stands of European make. These Oriental pieces have escaped the destructive repair which other parts of the collection have undergone, as the text confesses.

Plates 31 and 42 represent a class well known to those who have studied French furniture of the eighteenth century as made up in Europe from panels and planks adorned with Japanese lacquer-work of the richest sort, and much good taste is shown in such pieces—more than would have been thought possible—in an accommodation of the black and gold or dull green and gold landscape decoration of the surface to the less refined European adornment. Plate 39 is a beautiful sideboard of the style of Louis XVI., with lacquered panels of exquisite character. We note three other pieces of similar character, in which what are more probably Chinese panels are inserted in a European-made frame.

Of European design unmodified by strange influences the most important piece would seem to be the ebony cabinet in Plate 1, and the most historical piece King William the Third's writing-table shown in Plate 8; though one learns with regret that this table had almost gone to pieces from neglect and careless handling, and that a very complete overhauling was necessary not long ago. Its whole surface is inlaid with marquetry of a very delicate sort, and it bears a cipher of the combined initials of William III. and Mary II., though this is not seen in the plate. There are several pieces of silver furniture presented to William and Mary by the citizens of London or by special bodies of merchants and the like, and some of them are of great beauty. Then there are Boulle cabinets and sideboards, some of them announced as of English work made under the influence of André Charles Boulle and his associates; and one piece at least, a really splendid object, from the great master's workshop. A sideboard announced as English is itself a wonderfully delicate specimen of the famous inlay, introduced by Boulle, of tortoise shell and sheet metal. There are two or three pieces of Louis Sixteenth furniture, in addition to those with Japanese ornamentation, as explained above. A writing table, Plate 35, is a beautiful piece of marquetry; a cabinet, Plate 45, is one of the more pompous pieces of the revived classic style, and another cabinet, Plate 40, is as fine in detail, and contains magnificent plaques of painted porcelain from Sèvres. A similar piece is shown in Plate 41, and the long description of this includes the statement that it was purchased in 1827 for two hundred and ten pounds sterling. It would be a pleasure to see it at auction in Paris to-day; and it would be dangerous betting that it would reach a lower price than a hundred thousand francs; so incredibly great has been the increase in money value of fine pieces of this epoch.

Only three tapestries are given, but those three are fine, and finely reproduced in the photogravures. One is Flemish, one is English of the seventeenth century and of the Mortlake works, and the third is a really splendid piece of Gobelins, "Jason Sowing the Dragon's Teeth," one of a set of six.

In this way the book affords a museum of splendid furniture which, even without printed descriptions or other assistance to the student, would have its unquestioned value. The text exists, however, and, although it claims no great learning and displays no great acumen in the description of the pieces, it still gives information that is worth having. The author, not of necessity and because of his post a judge of works of decorative art, goes afield sometimes to gather information concerning the pieces in his charge, and is often right and instructive to his readers, though again he makes odd mistakes. On page 104 there is an effort made to explain Boulle work, that is, the famous inlay process, and the puzzling terms connected with it are explained without error and with sufficient fulness. Of the mistakes, it is hardly worth while treating at length. What is really noticeable in the text is the description of the extraordinary wastefulness that has marked the treatment of the precious contents of Windsor Castle from the first, almost down to the present day. This need surprise no one. What has been said of the very domestic character of the English royal residence accounts for much of it. The succeeding sovereigns or their lord chamberlains, or their mistresses of the robes, or their stewards, have felt free to refurnish in the newest style, and the older pieces have been stored away in cellars or garrets; or, in a thousand unrecorded cases, have been simply carried off. It is probably considered no theft to appropriate a disused and perhaps defaced piece of furniture found in a royal store-room. Accordingly, it appears that not one piece of furniture, of hangings, metal-work, or the like, which was mentioned in the inventory of 1547, in the reign of Edward VI., is now to be found. Again, we are told in the introduction, that "no true Jacobean furniture" exists in Windsor Castle, and it appears that by this is meant furniture of the reign of James I., as is technically correct. Moreover, though King George IV. (1820-1830) had careful inventories made of the contents of this and the other royal residences, the greatest difficulty is now experienced in identifying the various objects mentioned. It appears, too, that nearly £180,000 were spent, in 1830, for renovating these and other royal possessions; and that alterations of the most serious description were made in very many important pieces—"in almost every piece," says our author. It is some slight consolation to be told that "some of the finest of the later French examples escaped the general renovation."

It is evident, then, that Windsor Castle is not a museum of works of art in the strictest sense. There has been too much repairing and remaking, and the placing of marble slabs on pieces never intended to receive them, and the planing off of rude ancient paintings on the insides of doors to replace them with pasted paper of a crudely colored sort. It follows that if the contents of Windsor Castle were offered, *en bloc*, to the Victoria and Albert Museum, that would probably happen which would certainly happen if they came into non-English hands—they would be accepted with the proviso that minute examination and unlimited overhauling should be allowed. Your Jacobean cabinet would

need be looked at very closely before it was labelled or catalogued in accordance with the first description.

Heretics. By G. K. Chesterton. John Lane Co. 1905.

A heretic, if we go back to etymology, is really only a man who makes a choice. The word acquired its present coloring in the days when those who controlled the thoughts and beliefs of men admitted no power of choice. Not to conform was to be persecuted in this world, and damned in the next. But since nonconformity was in that remote past a sign of exceptional intelligence, however sinfully applied, the modern man who thoughtlessly rejects the fetters of doctrine calls himself a heretic with a silly, deprecating smile, as though the name had not long ago lost all its distinction. If you want to be really distinguished in these days you will be doctrinal. For that you will need all your courage and a rare strength. It has always been the peculiar distinction of Mr. Chesterton's position. He goes forth to war, not for any new-fangled counsel of perfection of freedom of will, but for the good old commonplaces, the fruit of the accumulated wisdom of the ages. Any one can champion a Superman, for his theory will never be put to the test of practice; or the advantages of cosmopolitanism, since we all remain firmly planted in our limited parochial interests and shall so remain. But it takes real eloquence to argue that we had better ignore Irish paganism and keep Christmas, thankful that we have a real live tradition no more vulgar in the fashion of its observance to-day than the Olympian Games were vulgar in the sixth and fifth centuries B. C.

The essential weakness of the present age, as Mr. Chesterton envisages it, is really nothing else than that which distressed Socrates in fifth-century Athens. Everywhere he sees, as Socrates and Plato saw, men trying to secure for themselves and their children something whose good they cannot define.

"The modern man says, 'Away with your old moral formulæ; I am for progress.' This, logically stated, means, 'Let us not settle what is good; but let us settle whether we are getting more of it.' He says, 'Neither in religion nor morality, my friend, lie the hopes of the race, but in education.' This, clearly expressed, means, 'We cannot decide what is good, but let us give it to our children.' . . . I see that the men who killed each other about the orthodoxy of the Homoousion were far more sensible than the people who are quarrelling about the Education Act. For the Christian dogmatists were trying to establish a reign of holiness, and trying to get defined first of all what was really holy. But our modern educationists are trying to bring about a religious liberty without attempting to settle what is religion or what is liberty. If the old priests forced a statement on mankind, at least they previously took some trouble to make it lucid. It has been left for the modern mobs of Anglicans and Nonconformists to persecute for a doctrine without even stating it. . . . I revert to the doctrinal methods of the thirteenth century, inspired by the general hope of getting something done."

Heterodoxy has always meant simply "the other man's doxy," and Mr. Chesterton's heretics are a few distinguished contemporaries who do not agree with him as to fundamentals. First, Mr. Kipling. His peculiar self-deception, says Mr. Chesterton, lies in thinking that he is writing for the glory of militarism, when what he really admires is discipline, the sort of organization that is quite as admirable in a department store as in the War Office or a camp. Mr. Kipling, then, if he really knew himself, would see that it would be more logical to stick to the praise of the engine-room or works of irrigation than to exhaust his vocabulary in glorifying the truest possible sign of the decadence of his nation, its militarism, its dependence on armies and the most modern make of gun instead of on the courage of every individual citizen. Another weakness is his cosmopolitanism. He "thinks of England as a place." He knows it "as an intelligent English gentleman knows Venice." But he has not "the patience to become part of anything. . . . And under all this vast illusion of the cosmopolitan planet, with its empires and its Reuter's Agency, the real life of man goes on concerned with this tree or that temple, totally uncomprehended, totally untouched."

But it is Mr. Shaw who is the most perfect type of a self-deluded heretic; an unusual type in that he is thoroughly consistent. In fact, we know what Mr. Shaw will be saying thirty years hence much better than we know what any Cabinet Minister will be saying thirty years hence. His strong point is his readiness to "apply the Shaw test rapidly and rigorously to everything that happens in heaven or earth." His weakness is that he fails to see things as they are because he is blinded by the light of an impossible ideal, the Superman. He has never seen things as they are, because "this secret ideal has withered all the things of this world." "It is not seeing things as they are to imagine a demigod of infinite mental clarity, who may or may not appear in the latter days of the earth, and then to see all men as idiots." For it is the ordinary man, seen as he is, who is really the prodigy, "a wonderful and unnerving matter." Mr. Shaw, asking for a new kind of man, is like a nurse who has tried a rather bitter food for some years on a baby, and, on discovering that it is not suitable, does not throw away the food and demand a new food, but throws away the baby and asks for a new baby. There has been no better or more lucid criticism of Mr. Shaw than these few pages, in which the very man who, in his 'Quintessence of Ibsenism,' forbade men to have ideals, because they would blind them to the particular case, is shown to be unable to see men as they are because he is always comparing humanity with what is not human, a monster from Mars or the Wise Man of the Stoics or the Economic Man of the Fabians.

It is mainly Mr. Shaw's lack of humility that prevents his proper appreciation of man as he is. Mr. H. G. Wells, another heretic, is humble with "the clear personal simplicity of the old world of science." Like Mr. Chesterton, he has come to "the most dreadful conclusion that a literary man can come to—the conclusion that the ordinary view is the right one." His weakness is common to all who frame Utopias—an indifference to human psychology. In his ideal State he ignores the human soul as Plato ignored it in his 'Republic,' though Plato did not at any rate make the mistake of supposing that pure cosmopolitanism was possible for the race. In the case of Mr. Wells and his philosophy Mr. Chesterton again shows his own affinity to the Platonists in a long and careful refutation of Mr. Wells's assertion of a Heracleitean flux. Curious indeed that, after so many battles lost and won in the field of philosophic discussion, it should be possible for a Mr. Wells gravely to repeat the doctrine that All things are in a state of flux, and for a Mr. Chesterton to set himself soberly to prove that "it *cannot* be true that there is nothing abiding in what we know."

As a critic, not only of heretics but of various aspects and relations of life discussed in this volume, when he has finished off the heretics, Mr. Chesterton shows a definite advance in clearness and force. One fault is thrust on him by his peculiar championship of the doctrinal, an excessive use of those "paradoxes that sit by the springs of truth." One is driven to be startling as well as brave when one is asserting that two and two do not make five. He repeats himself with a fine carelessness, as though, having thought of a good illustration, one could not do better than go on using it; a practice for which there is much to be said in these days when every writer prides himself on a cheap variety of phrase and cannot venture to use so much as the same word twice in a sentence. No one can forecast Mr. Chesterton's future as a critic, and it would not surprise us if it should prove that the true vocation of all this abundant energy is something quite different from setting his contemporaries straight. Meanwhile he knows how to make men stop and look, not at some new and striking theory, like Mr. Shaw (that is easy enough), but at the more settled, more rigid views that are out of date, if perchance they may not, after all, be suited for yet another generation's wear. This is a restful thought at a time when we have been assured by one of the most brilliant of living writers that no truth, no moral generalization, should be allowed to live for more than twenty years. After that it is diseased, decayed, and should be discarded and replaced, which is "progress."

My Sixty Years on the Plains: Trapping, Trading, and Indian Fighting. By W. T. Hamilton. New York: Forest and Stream Publishing Co. 1905.

Indian fighting has always been so obvious and facile a field for the sensational newspaper romancer that one picks up anything new on the subject with a justifiable feeling of suspicion. In the narrative of "Bill Hamilton," however, we have a document of real significance. Born in the Cheviot Hills in 1823, the casting vote of his uncle, two years later, turned him with a company of twenty-five men toward America instead of India, to which twelve of the party had wished to go. The family finally settled in St. Louis, where the son received five years of schooling, but suffered seriously from chills and fever, so common a scourge along the river valleys of the Middle West in the early days. In his twentieth year a physician's advice started him over the plains with a party of independent hunters and trappers. The programme called for a year of this life, but the excitement of it fell in too harmoniously with young Hamilton's temperament ever to allow a return to the habits of a more settled civilization. As Indian

fighter, trapper, and trader his years have been spent, and at the advanced age of eighty-three he tells the reader that it is still his habit to spend a portion of each year trapping in the mountains, "thankful that he can still enjoy and appreciate the wonderful beauties of nature."

The alert reader, however, soon discovers that the fundamental motive does not lie in the enjoyment and appreciation of nature as these words are generally understood. Among those of his kind he would probably admit that to his own eyes an Indan's scalp was the fairest flower his hands had ever plucked; and it is as a psychological study of the attitude of the early trappers and traders toward the Indians that the book has its chief value. To Mr. Hamilton the Easterner, or Westerner either, who would halt at scalping a slain Indian or burning a heap of Indian bodies, as a warning to others unfortunately still living, is simply a weakling whose good opinion of his book or its author is not of sufficient importance to warrant concealment of the facts. And as he does not conceal, neither (apparently) does he exaggerate. The good Indian, in his creed, was the Indian whose valuation of his hunting grounds was not high enough to cause him to object to the presence of the paleface with his traps and guns, and who would raise no troublesome question, either of fact or of ethics, over the purchase of a ten-dollar skin for some trinket worth hardly as many cents. Of course, questions of freight and life insurance may fairly be considered to enter prominently into merchandise of this sort, but our author specifically asserts that over $7,000 worth of marten skins could be carried out of the wilderness on a single pack-horse, and as for danger to life the Indian certainly had the bad end of the bargain. In one chapter we have an amusing descrlption (written in perfect gravity, however), of the versatile mendacity with which "Bill Williams," leader of Mr. Hamilton's party, deluded and defrauded another white trader. As he knew Williams to be "the soul of honor," he ventured to ask for an explanation. "Diplomacy," was the laconic reply. It was sufficient for Mr. Hamilton, and long years of observation have convinced him that honorable merchants in general follow the same tactics.

Mr. Hamilton has nothing but contempt for alleged Indian prowess. The free white trapper could outclass him at every point at which the two came into conflict, and the end of the struggle was predestined from the beginning. The impenetrability of such a mind to any idea of Indian rights as against a white man is complete and unalterable. The believer in such rights has taken himself out of the realm of reality, he would say, and is a negligible quantity; or, to convey the thought in more familiar language, he would call him a d——d fool. From this type of man the Indian of the Western plains and mountains largely formed his idea of the white intruder, and that is why so many names of Indian tribes marked upon the atlases of fifty years ago no longer represent anything more tangible than the mouldering flesh and bones which have gone into the fertilization of the fields of the Western farmer of to-day. We may readily admire Hamilton's energy and resourcefulness, and admit that the harm was done, perhaps irreparably, before he came upon the scene; but it would be a pretty serious indictment of clvillzation to hold that there was not at the outset a less bloody possibility—a possibility which would have put energy and resourcefulness into the task of getting civilization into the Indian's heart and brain, rather that that of getting the scalp from his head.

James Macpherson. By J. S. Smart. London: David Nutt. 1905.

Voluminous as the literature of Ossianic controversy already is, Mr. Smart has fully justified himself for adding one book more to it. His survey of the subject is in many respects the best we remember to have seen. In a sense, his work contains nothing new, and he does not make for it any claim of orlginality. The opinions he sets forth about the writings and the puzzling career of James Macpherson rest almost wholly on the investigations of other scholars, to whom full credit is given. But Mr. Smart has mastered the material so well and shown so good a sense of its significance that his book passes out of the class of mere second-hand compilations, and becomes an instructive essay in the literary history of the eighteenth century. It will serve good purpose, we may hope, in disseminating sound doctrine on the subject with which it deals. For although Celtic scholars are now in substantial agreement concerning the nature of Macpherson's Ossianic poems, there is still much misapprehension about them in the minds of others, and Mr. Smart's book will doubtless be read by many who would never consult the notes in J. F. Campbell's 'Leabhar na Feinne,' or find their way to the articles of Dr. Macbain, Professor Stern, and Mr. Alfred Nutt.

So long as Ossianic discussion turned largely on the character and motives of Macpherson and his various friends and sponsors, there was little hope of reaching any satisfactory agreement. Men were too likely to take sides according as they were by temperament adherents of Macpherson or of Dr. Johnson. Still more fruitless were the arguments about the nature of primitive epics and the long patriotic wrangle about the nationality of Ossian, whether he was a Scottish or an Irish Gael. The only secure results, as Mr. Smart shows, have been obtained by comparing Macpherson's productions with the native poetry in mediæval and modern Gaelic, of which a large quantity has become accessible in the last generation. The result of this comparison has been to convince scholars that Macpherson's Gaelic is modern and sometimes bad, and that the metrical form of his pieces is utterly unlike that of the genuine Ossianic poems. Incidental evidence makes it practically certain that his Gaelic version was translated from the English of which it purported to be the original. The English "Ossian," in turn, was only slightly dependent for style or substance on the native ballads, and was about as much the work of Macpherson as 'Paradise Lost' was the work of Milton.

Mr. Smart not only gives an admirable statement of the chief arguments which have led scholars to these conclusions, but he also discusses their wider bearings. It is obvious that, with the English Ossian thus disposed of, much that has been written about the Celtic genius has ceased to apply. Matthew Arnold's famous essay was not entirely unaffected by the false, or at least one-sided, conception of Celticism to which Macpherson gave rise, and the tradition has been maintained by a series of Anglo-Celtic writers. Mr. Smart comments very sensibly on this tendency, and argues for a truer and more complete characterization of Celtic literature such as has been made easier in recent times by the publication of great numbers of native monuments of every period. His critical observations appear to us to be generally sound. He is also right, in our opinion, in taking issue with some of the ethnological doctrine promulgated by Renan and Arnold in their essays on the Celts.

Chopin, As Revealed by Extracts from his Diary. By Count Tarnowski. Translated by Natalie Janotha. Scribners. 1906.

George Sand et sa fille: d'après leur Correspondance inédite. Par S. Rocheblave. Paris: Calmann-Lévy.

These two books, of very unequal merit, give us the opposite sides of the miserable quarrel that parted George Sand and Chopin shortly before the composer's death. It is not easy to mete out even justice to the great French novelist, nor does either of these books attain that end; her defender claims too much, her accuser is that and nothing more. After all, the strongest chord of her life was her marvellous power of work and unsparing artistic conscience; its ever pressing spur was the constant necessity of earning money. Who can forget De Goncourt's delightful, if unsympathetic, picture of the eminent authoress at Nohant, finishing a novel at 2:30 A. M., and, without a pause, taking up a fresh sheet to start a new one? That was her life, and in it De Musset, Chopin, even her children Maurice and Solange, were only incidents. That she tired of Chopin, that she got rid of him, that she quarrelled with him, is true; but that she acted as a monster does not in the least follow. In her letters to Solange her consciousness of innocence is transparent. After the return from Majorca, for seven years she was Chopin's nurse, and only his nurse. The post was arduous, for it is beyond question that the Polish composer was of the most fretful and trying temperament. And when the break finally came, it is clear from the letters now printed by M. Rocheblave that it was owing to Chopin's interfering in the matter of the marriage of Solange to the sculptor Clésinger. Chopin was never in the secret of the circumstances that made George Sand, with perfect justification, take up an attitude distinctly hostile to Clésinger; and she, determined to defend the sanctity of her literary laboratory at Nohant, decided to have done with his interference.

Count Tarnowski's book is extremely slight; such new matter of Chopin as it offers is scrappy and not satisfactorily presented; his own comments disclose no extensive knowledge of his subject. On the other hand, M. Rocheblave gives us a skilful piece of bookmaking. The editing is restrained, even to the verge of prudishness. Many of George Sand's letters here given for the first time are well worth

reading. One extract only can be indulged in, one in which she sums up, precisely and delightfully, her whole attitude towards her wayward Solange. She writes to her reprovingly in June, 1858:

"Mais le beau Pâris de Troic, aux cheveux fusés, passe, et te voilà partie pour le pays des flûtes, des rubans et des grelots, affichant des airs de don Juan femelle, et disant avec de grands éclats de rire: 'Mon Dieu, que j'étais bête, hier, d'être bonne et raisonnable!' Pourquoi tout cela? Je l'ai dit souvent: Je l'ai mise au monde, je l'ai nourrie, fouettée, adorée, gâtée, grondée, punie, pardonnée; et avec tout cela je ne la connais pas du tout, ne pouvant jamais deviner ni comprendre pourquoi elle fait ou veut faire telle ou telle chose qui pour moi n'a pas sa raison d'être."

BOOKS OF THE WEEK.

American History in Literature. Compiled by Martha A. L. Lane and Mabel Hill. Boston: Ginn & Co. 50 cents.

The Nation.

NEW YORK, THURSDAY, MARCH 15, 1906.

The Week.

President Roosevelt's telegram of congratulation upon the extermination of the Moro band in Jolo is as inconsiderate as the Kaiser's famous dispatch to Krüger. From even the high Imperialistic point of view, the wiping out of the Moros was nothing more than a stern bit of disagreeable police duty, about which the least said the better. To refer to it as upholding "the honor of the American flag," is a painful misuse of language. We have yet to hear any one speak of that bloody work except with misgivings and disgust. It makes no patriotic appeal whatever. And even its description by Mr. Roosevelt as a "brilliant feat of arms" is open to grave question. From the army in Manila come bitter complaints that the sacrifice of our men was wholly unnecessary, while in military circles in Washington there is sharp criticism of Gen. Wood for flinging his troops needlessly against fortifications that might have been taken in a less spectacular and murderous fashion. And the stories that are beginning to come out about women and children being included in the indiscriminate slaughter have a strange relation, if they are authentic, to the "honor of the flag." We know what we thought and said of the Dutch soldiers in Java, sparing neither age nor sex. We know what a cry of horror would have gone up in this country if such a deed had been reported of Spanish troops in 1897.

Secretary Taft has long been thought to cherish the honorable ambition to become a member of the Supreme Court, and his nomination by the President to succeed Judge Brown would in itself be commendable. In point of age, as well as by attainments and services, Mr. Taft is well fitted for this important position on the bench. His vigor and industry give good promise of usefulness for many years. On the great questions which will probably come before the Supreme Court for adjudication, in one form or another, his opinions, so far as known, are conservative. He was a theoretical anti-Imperialist before becoming an Imperialist in action. As he has been opposing the President's extreme views—or, rather, extreme lack of views—on the railway-rate question, it may be inferred that he would stand firmly for the principle of judicial review of any legislative or administrative action tending to impair the rights of property. Considered merely as a judicial appointment, then, there is nothing to say against Secretary Taft's possible transfer to the Supreme Court.

A scruple, however, suggests itself when we look at the matter from the point of view of public business. Secretary Taft has two great pieces of work on his hands, Philippine Administration and Panama. The two might be described, respectively, as a big job and a big mess. We cannot imagine Mr. Taft throwing them over in weariness and disgust; yet that impression might go abroad. The effect upon the Filipinos especially might be unhappy. Mr. Taft has had their confidence in a marked degree. They have thought of him as their ardent and indomitable friend. Only the other day, after the Senate's cruel dashing of Filipino hopes, Secretary Taft announced that he had but just begun to fight for their tariff rights. Who would continue the battle for them now? The President is not disposed to risk anything by antagonizing the standpatters; would Mr. Taft's successor be so disposed? And would not his withdrawal from the scene signify a lurch still further downward into general indifference and neglect as respects our Philippine problem? These questions suggest the regrettable aspects of the case should Mr. Taft go to the Supreme Court. Politically, his definite taking himself out of the list of Presidential possibilities would have much significance. He has been a candidate—at least contingently. In Washington, it has for some time been believed that he was the most promising man in sight for the Republican nomination. If he should now end it all, the inference would be that the appeal of a judicial career had overborne the other temptation; or perhaps that to Mr. Taft, deeply pondering, a Republican nomination in 1908 had not seemed to guarantee election.

Congress has extended the time for the dissolution of the tribal governments of the Five Civilized Tribes in Indian Territory until the problems that are peculiar to that Territory are less serious. This "respite" from March 4, the date set some time ago for the extinction of tribal organization, is a significant recognition of the effectiveness of the modern Indian as a working statesman. In the opinion of Congress, the job of turning 80,000 Indians into United States citizens, and 31,000 square miles of tribal territory into a Western State, can best be carried on, for the present at any rate, by the surviving organizations, working in connection with the United States courts and the agents of the Interior Department. So, instead of turning the modern Red Jackets out to apostrophize the setting sun, Senator Clapp and the others have invited them to assist in impressing upon Congress the importance of such questions as continuing prohibition in the new State to be erected out of their lands, and to point out to the Republican leaders that, if they persist in joining Democratic Indian Territory to Republican Oklahoma, the two Senators to be chosen from the combined State will probably be lost to the party. One proof that the red man of the Indian Territory is not inclined to sit idly by while the white man and the Great Father at Washington dictate his fate, is that the Keetoowahs of the Cherokee Nation have organized themselves into a regularly incorporated society to continue certain specific work after the final dissolution of tribal government.

There is hardly a line of the Statehood bill as it comes from the Senate but accords with the views of an overwhelming majority in both houses of Congress and responds to a strong conviction in the country at large. The Senate has simply stricken out the matter in controversy, leaving that on which perfect agreement exists. Everyone concedes that Oklahoma and Indian Territory ought to be admitted to the Union as one State. If this is not done at the present session, it should at least be clearly understood that the reasons for non-action are purely political. The alleged "tactical" reasons for combining the two Statehood proposals in one prove on examination to be exceedingly vague; and even if they were cogent, the claim of justice for a Territory that has waited so long and made such great progress as Oklahoma would outweigh them. The House last year refused a bill which would have admitted Oklahoma-Indian Territory but kept one of the Southwestern Territories waiting, thereby making it certain that they would ultimately become two States. There was some reason in that. There is none worthy of being listened to for blocking legislation again this year. Pass the pending bill, and the two-State and three-State men can take up their old fight next year without the slightest prejudice. Nothing but "playing politics" can defeat so just a measure as this.

"Senator La Follette has broken the ice in the Senate," remarked a newspaper paragrapher, after the new member's maiden speech, "but skating is still good around his colleague's desk." The confirmation last week of two of

Spooner's appointments, which had been vigorously opposed on personal grounds by La Follette, is an event hard to reconcile with Senatorial courtesy as it exists. Of course, the wishes of individual Senators must occasionally be overridden, as in the case of Collector Crum at Charleston, for instance, but here we deal with two majority members in good standing. Again, the "particularly and personally obnoxious" argument was the ground for removal of an anti-Addicks postmaster in Delaware, a few years ago, and, strangely enough, was accepted by Henry C. Payne, for the benefit of whose former henchman Mr. La Follette's objections are now being swept aside. It must be acknowledged that the cases against the new Hongkong consul and the new Milwaukee postmaster were weak, because there was no proof of unfitness, and the factional difference was presented in its baldest light. Still, more frivolous objections than that have been deferred to in executive session. We fear that the "harmony" between Wisconsin's Senators is very like that of their respective followings at home, if we may gauge them from their newspaper organs. Both sides talk incessantly of burying the old differences, but whenever a specific issue arises they are at each other as bitterly as ever.

George E. Green of Binghamton, former State Senator, retains in undiminished vigor his "faith in human nature." From his point of view, this faith is abundantly justified. A few days ago George W. Beavers, former superintendent of salaries and allowances in the Post Office Department, pleaded guilty to conspiring with Green in order to defraud the Government in the purchase of time-recording clocks. Beavers was duly sentenced to the penitentiary. The virtuous Green, however, who had presumably conspired with Beavers, stood trial and secured acquittal. How much he owed to political influence no one can tell. Certainly, he is deeply indebted to many Binghamton friends who came on to Washington to testify that he is one of the nicest men that ever happened. Then, too, the members of the jury may have felt that Beavers was the man who really deserved punishment. Beavers was a systematic and energetic grafter; he took toll of everybody and everything that he could lay his prehensile fingers on. Green seems to have labored under the impression that if he wanted to do business with the Post-Office Department, he simply had to give Beavers a rake-off; on no other condition would Green's time-recording clocks have a chance. Green, like many other nice men who are beloved by their neighbors, accepted the conditions under which traffic with the Post-Office used to be conducted. In short, Beavers was greedy and Green was practical.

The managers of the life-insurance companies are clearly enough trying to "bluff" the Armstrong committee. They are demanding everything in the hope of getting a few small concessions. Nominally they object to nearly every one of the important recommendations. If the committee yielded, the insurance law would remain with scarcely a radical amendment—except possibly that against campaign contributions. The attitude of the big insurance companies was well summed up by President Paul Morton of the Equitable. With much suavity he assured the committee that its work has been "earnest" and "sincere," and that "in the main" he was "in entire accord" with the conclusions reached. He was for publicity and State supervision; he was against paying money to politicians, against lobbying, "rebating, and deception." Yet there were a few points on which he raised a doubt: to wit, the prohibition of investments in stocks and in syndicate participations, the limitation upon new business and the cost of procuring it, the standard forms of policies, the contingent reserve, and the requirement of an annual dividend. There is, we admit, a question as to what the exact cost of procuring new business should be, and as to the exact amount of the contingent reserve; but that the expense of getting business should be much reduced, and that there should be no more accumulation of huge surpluses, every intelligent policyholder will insist. The Armstrong bills will, we are confident, be amended in some details, but the broad principles will, we trust, remain unaltered. The Legislature will bear in mind a fact which some of the speakers on Friday were inclined to overlook: that the insurance business should be conducted for the benefit, not of Wall Street speculators, not of the officers of the companies and the "inside clique," not even of the industrious field agents, but simply and solely for the benefit of the often obscure and neglected policyholder.

The Prudential Insurance Company's successful endeavor to stave off legislative investigation serves to deepen the widespread conviction that New Jersey politics and finance would profit from an inquest like that conducted by Mr. Hughes. The pretext that affairs of the Prudential were thoroughly probed by the Armstrong committee is too flimsy to be regarded for an instant. The committee was able to consider only briefly and superficially the companies organized in other States. The argument that an investigation would make political capital for Senator Colby is even sillier. The relations between the Prudential, its allies among banks and trust companies, the Public Service Corporation, and machine politics in New Jersey have long been notorious. The election of President Dryden of the Prudential to the United States Senate was something more than a tribute to statesmanship. Accordingly, an investigation by the Legislature seems likely to make capital for any man who sincerely works for representative government in New Jersey. Mr. Colby and his friends represent this movement for honesty, and they are entitled to all the credit and all the popularity they can earn, either with or without an investigation of the Prudential. Back of all the sophistry of the Prudential's lawyers remains the impressive fact that if the Prudential and its various allies have nothing to conceal, they have nothing to fear from turning on the light.

What are the reciprocal obligations of a boss-made judge and his creator? In Cincinnati there seems to have been some little difference of opinion upon this question. A judge of the Circuit Court testified on Saturday before a legislative committee that George B. Cox, when Republican leader of Hamilton County, asked him to "find some way of reversing" the decision in an important case that was to come before him. A second judge was asked by the boss if he could not "see his way clear to reverse this case, because the Lane & Bodley Company is a large concern, and unless a compromise is effected they may be compelled to go into bankruptcy." A third judge was merely asked to "give it a full and fair consideration"; and this was what all three expressed themselves as willing to do. There is a sort of tradition that every judge ought to do substantially that in all cases coming before him. This testimony regarding the attempt to inject politics into the actual work of the courts in Cincinnati is by far the most sensational yet brought out by the Ohio investigating committee. Richard Croker told the Mazet Committee very frankly that he considered it an obligation of Tammany judges to appoint referees satisfactory to the organization, but the Cox principle seems to go a bit further.

The differences between the anthracite operators and the mine workers fall into two classes: those which relate to underlying principles of management and those which relate to details of administration, such as adjustment of grievances, hours of labor, wages, and weighing. When the operators say, "We stand unalterably for the open shop," they set up a principle which is consistent and impregnable. Assuming this attitude, they cannot agree to "collect from each employee such amounts as may be levied" by the union and turn this money over monthly "to the author-

ized committee at the colliery." That would put upon the operators the task of forcing the miner into the union and deducting his dues from his wages. If a miner does not care enough about the union to support it, the demand that the operator shall interfere is preposterous. Furthermore, the miners propose the reconstruction of the Board of Conciliation established by the Anthracite Strike Commission, with the establishment of a new machinery of committees to deal with grievances. They complain in general terms of "the delays that have occurred during the past three years in the adjustment of grievances. Indeed, there are some cases which have been in the hands of the board for two years without a final decision having been rendered; and in very few cases have final decisions been reached in less than three months' time." The operators reply with a table showing that in three years only 149 cases came before the Board of Conciliation; that there were only seven cases in which an award in favor of the men was not settled or disposed of within three months; and that in cases in which decisions favored the men, the awards were retroactive, and the men received full compensation from the date of the grievance. On this exhibition the presumption is that the present board has done its work satisfactorily.

By a unanimous vote, the members of the Society of American Artists not already Academicians have agreed to accept probationary membership in the National Academy, and thus virtually to sink the newer body in the older. The number of the Academy is to be increased from 100 to 150, so that 50 Academicians will be elected in the next few years, largely from the Society. In return for this self-abnegation, the Society secures the acceptance of its jury system, which provides for a large committee and insures against the selection and hanging of pictures becoming too much of a family compact. Art-lovers will be heartily glad that this long-mooted union has been successfully effected, and we trust that the enlarged and rejuvenated Academy will not long be kept asking for the larger exhibition quarters it urgently needs. The recent policy of the Academy has been extremely liberal as regards recognizing new talent, and the membership of the federated body will be too large to become perilously honorific or to involve an invidious measure of personal prerogative. On all grounds, it is well that an unnecessary duplication of exhibitions and laborious committee work has been done away with. The reorganized Academy may reasonably claim a more generous public support than was ever accorded to either of its constituent bodies.

Premier Rouvier's defeat in the Chamber of Deputies was doubly unfortunate, since he was Foreign Minister as well, and was apparently carrying his Moroccan policy to a successful conclusion. The adverse vote of March 7 signifies little except as a reminder of the capriciousness of French political action. M. Rouvier was beaten by a fortuitous and unnatural alliance of Clericals, Nationalists, and Socialists of various complexions. The reactionaries were outraged at his venturing to enforce the separation law by inventorying Church property; the extreme Socialists were scandalized because he had promised to do this work gradually and with proper regard for the sentiments of the various communities affected. M. Rouvier is reported to have said that he could have had a handsome majority by merely promising to harry the Church remorselessly. The readiness with which the Socialists have turned against an able Prime Minister at a critical moment in the foreign policy of the nation, illustrates their academic detachment and political irresponsibility. M. Rouvier will retain the gratitude of all lovers of peace for his patient and tactful conduct of the delicate negotiations leading up to the Algeciras conference.

President Fallières has seen to it that the change of Ministry should involve personnel rather than principles. Premier Sarrien represents much the same sort of radicalism as Rouvier; M. Léon Bourgeois will continue unbroken at the Foreign Office Rouvier's policy of conciliation; the new Premier, like the old, will depend upon a composite majority of Radicals and Socialists. In appointing M. Aristide Briand, the reporter of the Separation act, to the Ministry of Instruction, the new Government makes a considerable overture to the Extreme Left, and engages itself to a more actively anti-clerical policy. This it may safely do, for the general elections will be held in a month or so, and a new Chamber of Deputies may bring about a general realignment of groups. The present Government, though of a weighty and authoritative sort, may turn out to be only a stop-gap. Anti-clericalism and government by the Radical-Socialist *bloc* have run about the course of life generally allotted to political movements in France; and while the anti-clerical and socialistic policies that have prevailed since the resignation of Waldeck-Rousseau undoubtedly retain their popularity, their electoral support becomes increasingly perfunctory. Many observers of the situation feel that some kind of a return to moderate republicanism is impending, but such a movement, at present, would have to seek its chiefs largely among the *ralliés*, a group of Republican converts which, though containing many statesmen of ability, hardly has the confidence of the people.

In the disputes and anxieties about Germans and French, the Moroccans have been largely forgotten. We have all been so absorbed in watching the cooks quarrel about the sauce in which the fowl is to be cooked, that we have given scarce a thought to the fowl itself. M. Victor Bérard's book on 'L'Affaire Marocaine,' just published by Armand Colin, has some valuable chapters on conditions in Morocco. He shows how nature makes that country look more to Europe than to Africa. In government and religion, too, Morocco requires exceptional treatment on account of exceptional circumstances. And that chronic disorder within Morocco seriously affects the French in Algeria, the facts put beyond doubt. The common frontier is for miles only an imaginary line in the shifting desert sands. Raiders cross it with impunity. It cannot well be denied, therefore, that the urgency of suppressing the contraband trade in arms, and of policing the disturbed frontier and the seaports, is peculiarly felt by France. It would appear that the conference has decided upon a native gendarmerie, officered by French and Spanish subjects, and under a sort of international inspection. Moroccan finances are also to be under joint control. Perfect equality of trade for all nations is guaranteed. Thus the dreaded "Tunisification" of Morocco is guarded against. Whether the great commercial development which all have talked of will immediately follow in Morocco must remain doubtful to one who follows M. Bérard's history. The natives may have perverse views of their own on that subject.

The Austrian Government's franchise bill, now under discussion in the Reichsrath, marks the end of substantially a revolution. Without the shedding of a drop of blood, without the menace of a general strike or serious threats against the Government, the monarchy has decided that it is best to grant general, equal, and direct suffrage throughout Austria. This action is all the more extraordinary in view of the bitter race feeling, not only between the various parts of the Empire, but within the confines of Austria itself, where the battle for the survival of the German tongue goes on with increasing intensity and heat. Half a century ago such a victory for democratic principles would have been hailed as another great triumph for the doctrines of this country. Today, however, it will excite but languid interest here. For if one of the oldest, most aristocratic and custom-bound monarchies of Europe is of its own accord giving way to liberalism, the American tendency is for the moment in the other direction.

THE LATEST MORO SLAUGHTER.

Congress should rigidly inquire into the latest "battle" in the Philippines. For five or six years past, at irregular intervals, we have had from the Moro islands similar cable accounts of fighting. In most cases the dispatches have been almost identical with those of Friday, affirming the wiping out of a dangerous band of renegades or ladrones at the cost of ten or fifteen American lives, with no prisoners taken, or wounded left on the field. There is usually the same assurance that the other Moros welcome the destruction of this particular set. This time there seems to be lacking the regular positive affirmation that peace is now at hand. But it remains to ask, what possible military excuse was there for charging up a mountain cone, 2,100 feet high, to attack an almost impregnable fort? Was there no possibility of forcing these Moros to surrender by starving them out?

We are moved to put these questions by recollections of the attack upon the Bayan fort in Mindanao in June, 1902, by troops of the Twenty-seventh Infantry. This stronghold contained only 80 or 90 Moros, every one of whom was killed when they were rushed by the Americans. Why they should have been attacked at all has mystified the army ever since, in view of the fact that there was little or no water found in the fort, and that it was surrounded on all sides. But Gen. Baldwin got his brigadier-generalcy, and a renown which never could have been his had the fort merely surrendered after a siege. Why mourn the officers and men who fell? Assuming that all the ugly echoes of this fight still reverberating are merely army gossip, it is interesting to note that the two junior officers who are now seeking brigadier-generalcies in Washington are basing their claims on alleged distinguished service against the Moros. Major H. L. Scott, for instance, asks this reward because he made, under Gen. Wood's direction, a similar battue of 300 Moros near Jolo, in November, 1903.

Now, Major Scott, Capt. Pershing, and others may have really earned promotion, but the country has no way of knowing it. In England, if news of such a fight, on the Afghan border, should reach London, the War Office would be open to Parliamentary cross-questioning and would be made to show that the conflict was unavoidable. There are cases where officers have been brought to book for such affairs. With us there is no check of any kind. Congressmen and Senators rarely go beyond the press, and the Philippine Committees concern themselves only with legislative matters. The Secretary of War controls the situation, and is, of course, kept hourly informed—when the cable is not broken—during one of these punitive expeditions. But he did not think it worth while even to refer in his last annual report to conditions among the Moros by so much as a single word. The President, however, declared in his last message that "the Jolo disturbance was put an end to by several sharp and short engagements, and now peace prevails." He must, therefore, be astonished to learn that the extinguished band had long been a nuisance by reason of their raids on friendly Moros, and that they had stirred up a "dangerous condition of affairs."
